The new buildings for Taunton's Trade School in New Road and Trinity Road were recently opened. The buildings are of red bricks. The dining-room is 20ft. by 14ft., has a wood-block floor, and is capable of accommodating forty boys at dinner. To the left is the technical instruction room, which also has a floor of wood blocks, and measures 26ft. 10in. by 26ft., with working space for thirty boys. A wide staircase leads to the first floor, providing hat and cloak lobbies and assembly-room; this room is 44ft. by 26ft., and is lighted by four windows on the north side. On the side opposite the windows is a bay with raised platform, which can be reached by a separate entrance from the cloak-room; another flight of steps leads to the second floor, containing three class-rooms. The woodwork throughout the interior of the building is stained oak. The old offices have been pulled down, and new offices,

with automatic flushing, erected on the south-east of the triangular plot on which the building stands. The cost is estimated at £2300 (exclusive of site), which works out at £10 per head. The builders are Messrs. Brinton and Bone, of Southampton; and the architects, Messrs. Mitchell, Son, and Gutteridge, of the same town.

## JERRY-BUILDING IN ABERDEEN.

A PUBLIC meeting was held on March 28th, in the Trades' Hall, Aberdeen, under the auspices of the Operative Masons' and Granite Cutters' Union, for the purpose of drawing attention to the prevalence of jerry-building in Aberdeen. Mr. John Anderson, president of the union, occupied the chair.

The chairman said that the question of jerry-building had been under their consideration for some time, and a meeting such as was being held would perhaps go far to make it plain that something might be done to improve on the present condition of affairs. Resolutions would be submitted by operatives, and he thought that evidence would be given showing that the operations of jerry-builders were not in the best interests of the community. Many letters were read from associations who had not been able to send their representatives, expressing their sympathy with the object of the meeting, and admitting the existence of the evil.

The first resolution, moved by Mr. John Elric, was as follows:—"In view of recent experiences in the building trade, this meeting of citizens protests against the operations of the jerry-builder, on the ground that such operations are dangerous to workmen and detrimental to the interests of the community, in so far as dwellings are not erected with a view to the comfort and convenience of the occupants, but solely in the interest of the speculator." The resolution was duly seconded and carried. Mr. A. Robertson put forward the following proposition:—"That this meeting agrees to urge the Town Council to take steps to safeguard the workmen as well as the interests of the community by having fully-qualified inspectors or architects to supervise all work to which its Plans Committee gives sanction." This was carried unanimously.

Mr. James Souttar, architect, who was invited by the chairman to speak, said it was to be regretted that there was not time for conference, so that the Federation Council, the Architects' Council, and the operatives might have had opportunity to discuss this important question, so that they could have stood shoulder to shoulder that night. As it was, however, he felt that it had been a good thing that the operatives, feeling this matter as they did, and being, if possible, more deeply interested than any other person, had come forward themselves and expressed their own ideas as to the evil prevalent, and its remedy. If they had not had help from the masters or co-operation from the architects, it gave all the more weight and importance to their own action. His view was that the Dean of Guild Court should pass no plans that did not come up to a certain "Building Act" which it should frame or adopt, and that at least one qualified architect should be on that Court to see that the plans are according to the regulations. He also held that no plans should be looked to that are not submitted by qualified architects, who should undertake the supervision of the works to the end. In this way they would have a Building Act, a Dean of Guild Court, and guaranteed supervision.

The chairman said they would see that the last resolution was forwarded to the local authority. He remembered that resolution was passed in the Trades Council on this very subject, and it was discussed in committee of the Council. If he was rightly informed, one of the building employers was the greatest opponent of that resolution, but, fortunately for them, and he supposed the community would suffer no harm, that gentleman was no longer in the Council. They would be on their guard to see that this resolution was attended to.

## Keystones.

**The New Jamaica Bridge, Glasgow,** will shortly be finished.

**A new lifeboat house** is to be erected at St. Mary's, Isles of Scilly.

**Bonnington Bridge, Edinburgh,** is to be reconstructed and widened at a cost of about £5550.

**An Academy** is to be erected in Irvine from a plan by Mr. Armour, architect, at a cost of £10,000.

**A Stained-glass Window in Durham Cathedral** was unveiled on March 28th by Canon Tristram.

**The Purchase of Spitalfields Market** freehold has been decided on by the London County Council.

**Sutton Court, Chiswick,** will shortly be demolished, as the estate has been sold for building purposes.

**Mr. Birket Foster,** the well-known water colour painter, died on March 27th, at Brae-side, Weybridge, Surrey.

**An infants' school is being erected** in Albemarle Row, Bristol. The architects are Messrs. La Trobe and Weston.

**The Diamond Jubilee Tower,** erected on Castle Hill, Huddersfield, was opened on March 25th. It has cost about £3000.

**A new free Open Air Bath** was opened in Liverpool on March 28th. It is 73ft long and 45½ft. wide, and has cost about £1000.

**The foundation stone of Ferndale Chapel** was laid last week. The chapel is to cost £3000. Mr. A. O. Evans, of Pontypridd, is the architect.

**New Washhouses in Glasgow.**—The new washhouses in Kennedy Street, Glasgow, were formally opened on March 24th. They have cost about £5000.

**The Foundation Stone was laid at Attercliffe** of a new Baptist Chapel, which is to be erected at the corner of Eleanor Street and Durnall Road.

**Ye Old Red Lion,** which will always be associated with Dickens's "David Copperfield," is to come down, because of the widening of Parliament Street.

**A New Chapel.**—Cardinal Vaughan has consented to the erection of a chapel in the new Roman Catholic Westminster Cathedral. The estimated cost is £7000.

**Worthing New Post Office** was opened on March 26th. It has been erected at a cost of nearly £4000, and stands at the corner of Market Street and Chapel Road.

**The New Unitarian Schools at Bradford** are now open. They have been erected at a cost of £1700, and were built from the plans of Messrs. Empsall and Clarkson.

**A New Board School** is to be erected at Calverley. The plans and specifications have been passed, and the Educational Department has sanctioned the borrowing of £4228.

**An Exhibition of Architectural Drawings** has been held, under the auspices of the Perth Architectural Association, in the lecture room of the Natural Science Hall, Perth.

**Railway Extension in Cornwall.**—A new section of the North Cornwall Railway, connecting Padstone with Wadebridge, has been opened. The line is five and a half miles in length.

**Fire Brigade Accommodation at Glasgow.**—The Glasgow High School building construction classes had a very successful visit to the central fire stations, old and new, first visiting the old station, where appliances were inspected, and the firemen, through Captain Paterson's courtesy, made a most efficient turn-out. The new fire station was next inspected, under the guidance of Messrs. Sharp and Drennan. The cost of the building will be £40,000; there will be men and officers' quarters, with gymnasium, &c.—all up to date. The building fronts Ingram and High Streets, with four running doors to former street. Mr. A. B. McDonald is the architect.

**St. Michael's, Bassishaw,** will shortly be demolished.

**The Widening of Lower Thames Street.**—The Improvements Committee of the London County Council have decided to recommend the Council to contribute £50,000 towards the widening of Lower Thames Street.

**Death of an Aberdeen Builder.**—A well-known builder in Aberdeen, Mr. D. Macandrew, died on March 27th. One of his erections is the Peterhead Convict Establishment, which cost some £32,000.

**British Museum Library Extension.**—The late Mr. V. S. Lean, barrister, has bequeathed £50,000 to the trustees of the British Museum for the improvement and extension of the library and reading-room.

**The Martello Towers,** erected as part of the Duke of Wellington's scheme for the protection of Southern England against Napoleon's threatened invasion, are gradually disappearing. Two of the towers near Hythe are to be blown up by the Royal Engineers.

**Inadequate Housing at Camborne.**—At a meeting of the Camborne District Council, the medical officer stated the house accommodation for the working classes is entirely inadequate for the district. The erection of an isolation hospital was also a matter for consideration.

**New Baptist Chapel at Reading.**—The foundation stone has just been laid for the new Baptist Chapel at the corner of Groveland's Road, Reading. It will provide accommodation for about 450 people. Messrs. Cooper and Howell are the architects, and Messrs. Collier and Catley the builders.

**The restoration of the Wadham transept** in Ilminster Parish Church is under the supervision of the architect to Wadham College, Oxford. In removing the plaster of one of the walls close to the tomb of Sir William Wadham, a piscina was disclosed, ornamented with the four-leaf flower pattern and other embellishments of the Early Perpendicular style.

**A Timber Drawer's Death.**—A timber drawer, named George Lowe, of Worsley Terrace, Golborne Road, Ashton, was killed on March 21st, at the Mains Colliery, Ashton, belonging to Messrs. Cross, Tetley, and Co. It appears that the deceased, along with a man named Williams, was engaged in timber drawing, when Joseph Lee, a drawer, heard a sound as if a roof were falling, and at the same time heard someone shouting for help. On going to the place he found Williams partly covered by the fall of roof, and at once got assistance. Williams was extricated, and it was found that both his legs were broken. Deceased was recovered some time afterwards, but was quite dead. An inquest was held on March 24th, at which the jury returned a verdict of "Accidental death."

**Goole Baths.**—There is a discussion going on between the School Board at Goole and the District Council concerning proposed baths. At a meeting of the Urban Council a letter was read from the School Board upon the subject of the proposed baths, and asking for observations of the Urban Council on them. The Goole School Board had a scheme for erecting baths upon the Alexandra Street School site, which the Education Department refused to sanction, and in reply to the letter the School Board wrote the Department that the Urban Council had refused to offer proper accommodation for the school children of the town, and that the baths were not central, were extravagant, and possessed other defects. They also stated that the Urban Council's baths were 1000 yards from the biggest school in the town, and inaccessible to the scholars, the Council having also refused to provide instructors or towels. To this letter the Urban Council General Purposes Committee replied, giving a categorical denial to each statement, and sending measurements which showed that the School Board figures were inaccurate, and that the site of the Council's baths was more central, and also that the scheme would only cost £6500. They denied that the School Board had asked the Council to provide instructors or towels.

## Trade and Craft.

### JOHN MATHEWS AND CO.

This firm makes a speciality of varnishes and varnish stains for decorators, coach-builders, japanners, &c., mixed paints and enamels, and also terebine and gold size. Their colours and stains are of great strength, ground absolutely pure in oil, spirits, and water; and are packed for home and export in all kinds of kegs, tins, and collapsible tubes. We have received a sheet of fifty-four shades of paints they supply mixed ready for use. These colours form a most comprehensive list of useful tints. Those who obtain their paints ready mixed from a firm like this can depend upon getting the same shade for any amount of work. The address of the firm is Hatton Garden Works, Liverpool.

### FOR STEAM USERS.

We have received a new catalogue of Messrs. Holden and Brooke's steam users' specialities. Among these may be noticed the exhaust steam injectors, which do, by means of waste steam, what an ordinary injector or pump does by means of boiler steam, and they provide hotter water without a feed-water heater, than other systems do with one. Also all heaters increase back pressure, whereas these injectors decrease it. The system of feeding boilers with water heated and forced by waste steam is the most economical, owing to the saving of coal. By an easily controllable and neat, compact, automatic instrument, the feed is pumped into the boiler for nothing, and heated up in the process. The injector is self-starting, and in addition to feeding boilers, it may be used for supplying hot water to any part of a works, and also for the heating of buildings. The firm also undertakes the repair of injectors of any make and pattern. This catalogue gives particulars of many other specialities for steam users, including the "Sirius" pulsating pump, Brooke's patent steam dryers, Brooke's patent anti-primers, the "Sirius" steam trap, Russell's steam pipe water ejection valve, water lifters, ejectors, &c., boilers and circulators, back pressure valves, boiler feed valves, footvalves, strainers. Address: Sirius Works, West Gorton, Manchester.

### NON-FLAMMABLE WOOD.

We have received a sample of wood, treated by the special process of the British Non-Flammable Wood Company, Limited. We have tested this sample and find that the effect of fire is simply to char it. The wood is largely used by the British and Foreign Governments, for warships, and by American architects in the construction of both large and small buildings. The process consists of impregnating by hydraulic pressure the fibres of wood under vacuum with a solution of fire resisting chemicals, which when subsequently evaporated leaves minute crystals deposited in the pores of the wood, thus fireproofing it and rendering it antiseptic. This treatment is claimed to be permanent. The process increases the weight of the wood by 5 to 12 per cent., and is claimed not to injure the wood for structural purposes, but for safety the Company recommends that when used for strength in construction, as for beams, rafters, &c., the scantling should be 5 per cent. thicker. The woods treated by the process are fir, mahogany, ash, beech, birch, cedar, cherry, elm, and walnut; impregnating to a depth of two inches all round is considered sufficient for all practical purposes. It is claimed that the wood will take paint, varnish, and polish better than ordinary wood, owing to the surface pores being filled up. Soft wood articles cost about 30 per cent. more, but with the harder kinds the percentage of increase is less. The process has the effect of seasoning the wood. Most exhaustive tests have been applied to the wood, and very satisfactory results obtained. The wood is practically incombustible, and its slightly extra cost, as compared with ordinary wood, should be no drawback to its general use, in view of the immense saving from fire-waste.

## Under Discussion.

### INTERIOR ELECTRIC LIGHTING.

At the last fortnightly meeting of the Glasgow Architectural Association, Mr. Sam Mavor delivered a lecture on the "Electric Lighting of Interiors." He pointed out that it does not require a skilful craftsman to lay electric light conductors in the grooves of wood casings erected by a joiner, nor to screw to their bases manufactured switches and such apparatus. The result is that much wiring work is done by men and lads who are not tradesmen, and who are ignorant of the consequences which might arise from their inexperience or carelessness. Many defects are of a kind which cannot be discovered by ordinary tests after the completion of the work, and it is, therefore, of great importance that wiring work should be inspected during progress. Architects were strongly urged to encourage their clerks of works to qualify as inspectors of electric light wiring, as they only were in a position to give inspection of the nature required.

### ELECTRIC TRACTION.

At a recent meeting of the Society of Arts Mr. Philip Dawson read a paper on "Electric Traction and its Application to Suburban and Metropolitan Railways." He said the problem of greatest importance in which electric traction would be a principal factor was the rapid transportation of large crowds to and from their business in our cities. England was the first to introduce electric traction on railways, both underground and overhead, as instanced by the City and South London and the Liverpool Overhead Electric Railways, but to prove commercially that very much heavier traffic could be handled and much greater distances traversed, and to develop the necessary machinery, was left to America. Confining himself to a service such as that given by the Metropolitan and District Companies, with frequent stops and short runs. Mr. Dawson emphasised the importance of rapid acceleration on such lines, and showed the advantages electric traction could give in that respect. From a comparison of actual results obtained on the Chicago electric railways and the Metropolitan and District lines in London, it appeared that, whereas the *maximum* speed of twenty-five miles an hour was obtained in 10sec. with electric traction, it took 33sec. to do it with steam locomotives, and that, whilst the electrically propelled train could do the distance of 1880ft. in 66sec., with steam it would take 93sec. He proceeded to contend that from the economical standpoint of generating power, electricity was a cheaper method of operation than steam locomotives, and to that end quoted a large number of figures giving results realised in American practice. In conclusion, he mentioned a few details regarding the two large power stations now being equipped in New York and designed to operate the two large tramway systems of that city—viz., the Metropolitan and the Third Avenue

### THEORY AND TRADITION IN ARCHITECTURE.

At the last monthly meeting of the Sheffield Society of Architects and Surveyors, Mr. E. P. Warren, of Westminster, gave a lecture on "Theory, Practice, and Tradition." He said the value of theories in the training of students of Architecture was twofold. Theories provide an excellent mental exercise and incitement to study; and such of them as are of approved authenticity, logical quality, and obvious derivation from experience pass into tradition, become axiomatic, and form part of the necessary groundwork of all architectural training. They are practically statements of first principles, and should form the initial exercises of the student. The architect needs the moral compass of trained discrimination, with its needle of principle ever veering to the north point of truth; provided with this, he can afford to make a few experimental divagations—he can always recover his true direction. It is often said that the profession of an

architect is a modern one; it appears to be understood that he has evolved himself, has created his profession and its modern condition, as they stand. This, said Mr. Warren, is an impossible view; the evolution was gradual, and very clearly traceable from the mediæval master builder upwards. The Renaissance brought new and foreign ideas and forms, and with them the need of a trained interpreter, a man of education. Inigo Jones, Wren, and Chambers all were interpreters. The architect has to supply the imaginative element that makes building Architecture; he is rendered necessary by the inability of the working builder to originate and organise comprehensive schemes. The difficulties of producing real Architecture under modern conditions are great and complex. Commercialism is against us; the rush and hurry of the age are against us; and perhaps our worst obstruction is the almost absolute lack of real sympathy with architectural ideals, the extreme paucity of educated taste which we meet with in our patrons, and our public traditions are broken, and have to be revived, or created afresh. The enormous help and value of strong tradition, the immense benefit of a real vernacular expression in Architecture, are abundantly apparent to those of us who carefully study the past, who read between the lines of architectural history, and who are struggling to apply true principles under exasperatingly antagonistic conditions. There is, however, hope for the future; we seem to have done with revivals, with mere copying of a dead past.

### EARLY ARCHITECTURE IN WARWICKSHIRE.

Mr. J. A. Cossins read a paper before the Archaeological Section of the Midland Institute on "Early Architecture in Warwickshire." He said that though it cannot be called a work of architecture, the great monolith, called the king's stone, at Long Compton, is the oldest erection by man in stone remaining in the county. Of Roman buildings we have nothing, or next to nothing. The oldest examples of building remaining are very probably some fragments of masonry in the wing wall which crosses the moat at Tamworth Castle, and the ground and second storeys of the central tower of Wooton Wawen Church. These are of the kind generally called Saxon; but although the well-known arches of the tower at Wooton Wawen have all the most prominent characteristics of that style, it is very probable the church was not built by the great and influential Wagen, from whom the place derives its name, but by Robert de Toner, to whom the Conqueror granted the place very soon after the Conquest, certainly not later than the eleventh century. There are some fragments of wall here and there in some of the oldest churches which may be of a date earlier than 1066, but it is by no means certain that they are so old. After the establishment of the Norman power, and during the reigns of the first three kings, cathedrals, monasteries, and churches were built in amazing numbers, but the wealth and energy of the nation during the time of Stephen were bestowed chiefly on building castles. During his reign there were founded, and either wholly or partially built, at least 1500 castles, of which 1050, it is said, were destroyed by Henry III. How all this building was accomplished in about eighty years, if the population was as small as it is generally supposed to have been, must for ever remain a mystery. There is very little doubt that the Saxons, when they built in stone, made rude copies from the already rude architectural fragments of Roman works, which must have been then very plentiful. But the earliest real Norman work was either done or superintended by masons brought over from the Continent. It was at first rude and simple, with very thick mortar joints, but very soon improved, and very noble and grand works of extraordinary richness were produced. In Bickenhill Church arcade there is an example of the ruder kind; in Polesworth an arcade as simple, but better executed; and in Beaudesert and Stoneleigh are works of extreme elaboration.

Of the 288 churches, or thereabout, in the county, about eighty-five have remains of Norman work, but there are many more that are of early foundation, of which no remains exist that can be recognised as Norman or earlier. About thirty-five are mentioned in Domesday Book as being then in existence, and it is probable that those belonging to monasteries were not included.

### SEWAGE DISPOSAL.

Mr. W. J. Dibdin delivered a lecture on March 27th to the members of the Royal Institute of Public Health in London on "Sewage Disposal." After tracing the history of the bacterial treatment, he said our authorities at the Board of Trade had still so much faith in what was known as the land treatment of sewage that they would approve no scheme unless, as a final resort, the effluent were passed over land. At first sight that system seemed admirable, even as a complete treatment. Sewage was passed over land, and it drained through the soil, and so became purified. Almost wherever tried, such a system would give satisfactory results at first, but the result did not last long. When examined, it was seen that this old system of filtration was a form of purification of the sewage by bacterial action, and it was not permanently satisfactory, owing to the fact that the liquid quickly cut channels for itself through the different layers of soil, and so was not retained long enough for the bacteria to act. It was also found that sewage deposited sludge on the surface, and in time this impregnated the atmosphere and became a nuisance. Mr. Dibdin showed by diagrams how these faults had been discovered in several cases. He also showed how the bacterial method was being carried out in various towns. Among these was Leeds, which city, he said, had been in very serious difficulty for some time as to sewage disposal, and they were now face to face with a possible expenditure of three-quarters of a million sterling in one of the alternative methods—bacterial or chemical action. They, therefore, initiated experiments to discover whether the simple process he was explaining would be useful in the case of a very complex sewage of such a manufacturing community. Those experiments he had watched, as also some at Blackburn. In the latter town there were very elaborate sewage works, which, however, were not satisfactory. By a series of elaborate diagrams Mr. Dibdin showed the weekly results of experiments, both at Leeds and Blackburn, and claimed that in both cases they had abundantly demonstrated the efficiency of the method. The resulting effluent came away somewhat opalescent, but in two days was perfectly clear and practically pure, so pure indeed that fish lived and thrived in it. As a result of this new method of sewage purification, chemical sewage works were dead. No new ones had been erected for a long time. The bacterial system, while comparatively inexpensive, was more efficient than any other. In the course of a discussion which followed, Mr. Dibdin said the effluent from the bacterial process contained valuable nitrates, which had an extraordinary effect upon some soils. At Sutton, for instance, land treated with it yielded a crop of mint which produced £24 per acre.

The Parish Church at Playden, Kent, has just been reopened, after having been restored at a cost of £900.

Additions to Eastleigh Parish Church are about to be executed from plans prepared by Sir A. W. Blomfield. The accommodation will be increased from 270 to 895 sittings, and the proposed expense is £4000.

An Underground Railway for New York.—The Rapid Transit Railroad Commission of the City of New York has accepted the proposition of the Whitney Syndicate to build an underground railroad in that city. The cost will exceed 50,000,000 dols. This will be the first underground railroad made in America.

## COMING EVENTS.

## Wednesday, April 5.

EDINBURGH ARCHITECTURAL ASSOCIATION.—Mr. H. O. Tarbolton on "Plaster-work," with limelight illustrations. 8 p.m.

ROYAL ARCHÆOLOGICAL INSTITUTE.—(1) Mr. J. Lewis André, F.S.A., on "Ritualistic Ecclesiology of North-East Somerset." (2) Mr. J. P. Harrison, M.A., on "Influence of Eastern Art on Western Architecture in the Eleventh Century." 4 p.m.

BUILDERS' FOREMEN AND CLERKS OF WORKS' INSTITUTION.—Ordinary meeting of Members. 8 p.m.

BRITISH ARCHÆOLOGICAL ASSOCIATION.—Dr. Fryer, M.A., on "Ancient Fonts in Gower." 8 p.m.

## Saturday, April 8.

EDINBURGH ARCHITECTURAL ASSOCIATION.—Visit to Woodhouselee, conducted by Mr. J. W. F. Tytler.

SANITARY INSPECTORS' ASSOCIATION.—Professor B. Fletcher, F.R.I.B.A., on "The Present Position of Sanitary Building Construction."

## Monday, April 10.

SANITARY INSTITUTE.—Mr. E. T. Hall, F.R.I.B.A., on "Sanitary Building Construction." 8 p.m.

VICTORIA INSTITUTE.—Meeting at 4.30 p.m.

BRISTOL SOCIETY OF ARCHITECTS.—Mr. Herbert Singer (of Frome), on "Iron and Bronze Work."

**BOWER & FLORENCE,**  
Polished Granite Manufacturers,  
**ABERDEEN, N.B.**

London Office: 64, FINSBURY PAVEMENT, E.C.  
Quarries: PETERHEAD, N.B.

SOCIETY OF ARTS.—Prof. H. R. Proctor, on "Leather Manufacture." The first of a series of four lectures. 8 p.m.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.—"The Application of Colour to Interior Ornament in Relief." Report by the Art Standing Committee. 8 p.m.

## Tuesday, April 11.

SHEFFIELD SOCIETY OF ARCHITECTS AND SURVEYORS.—Annual Meeting. Election of officers, &c.

## Wednesday, April 12

EDINBURGH ARCHITECTURAL SOCIETY.—Mr. J. Fairweather, of the Glasgow Architectural Association, on "Minor Points in Practice." 8 p.m.

SOCIETY OF ARTS.—Ordinary Meeting at 8 p.m.

SANITARY INSTITUTE.—(Lectures and Demonstrations for Sanitary Officers.)—Inspection and Demonstration at Disinfecting Station, Lot's Road, Chelsea. Conducted by Dr. Louis Parkes. 3 p.m.

## Thursday, April 13.

SOCIETY OF ARTS.—Mrs. Philip H. Newman on "Some Goldsmiths and their Works," with line-light illustrations.

INSTITUTION OF ELECTRICAL ENGINEERS.—Meeting at 8 p.m.

SANITARY INSTITUTE.—(Lectures and Demonstrations for Sanitary Officers.)—Inspection and Demonstration at Beddington Sewage Farm. Conducted by Mr. T. Walker. 3 p.m.

## CONTRACTS OPEN.

## PARISH of ST. GEORGE'S-IN-THE-EAST TO HOUSE DECORATORS, &amp;c.

The Guardians of the Poor of the above Parish hereby invite Tenders for PAINTING, &c., at the Schools, Upton Park, E.

Specification, form of Tender, and further particulars may be obtained at the office of Mr. G. A. WILSON, Vestry Hall, Cable-street, E., on a deposit of a £5 Bank of England Note, which will be returned upon receipt of a bona-fide Tender.

Tenders, sealed and endorsed, "Tender for Painting Works," must be sent to the undersigned not later than TWO o'clock on FRIDAY, APRIL 14th, and all parties tendering, or their authorised representatives, must attend at the Board-room at FOUR p.m. on the same day, when the Tenders will be opened.

The Guardians do not bind themselves to accept the lowest or any Tender, nor to pay any expenses incurred in the preparation of the estimates.

By order,

J. R. BROWNE,

Clerk.

Guardian Offices,  
Raine-street,  
Old Gravel-lane, E.

March 28th, 1899.

## BOARD of WORKS for the STRAND DISTRICT.

TO MASONS, PAVIORS AND OTHERS.

The Board will meet at No. 5, Tavistock-street, Covent Garden, W.C., on WEDNESDAY, APRIL 12th, 1899, at half-past six p.m., to receive TENDERS for the SUPPLY of YORKSHIRE, and other PAVINGS, GRANITE KERB CHANNELS, and DRESSED GRANITE, &c.; also for RELAYING AND REPAIRING the CARRIAGEWAYS and FOOTWAYS within the Strand District for a period to expire at Lady Day, 1902.

Printed forms with conditions of Tender, may be obtained No. 5, Tavistock-street aforesaid, between the hours of TEN and FOUR daily, where Tenders must be delivered (sealed), marked outside "Tender for Paving, &c.," and addressed to the Clerk, before TWO o'clock p.m. on the above day of meeting.

The contractor whose Tender is accepted will be required to produce testimonials as to character, and to enter into a contract and find two responsible sureties to execute a joint and several bond for the due performance thereof.

The Board does not bind itself to accept the lowest or any Tender.

By order,

FRANCIS S. ROBINSON,

Clerk to the Board.

No. 5, Tavistock-street, Covent Garden, W.C.

March 28th, 1899.

DWELLING ACCOMMODATION IN  
LARGE CITIES.

By JOHN F. J. SYKES.

ALTHOUGH it must be granted that the evolution of the human dwelling regarded as a structure is of primary importance, yet from the point of view of the dwelling accommodation required by modern civilised beings, it may be profitable to review the subject from a social as well as a structural aspect, since usage and sanitary precautions must form the basis of structural accommodation.

With this idea in view, the functions and requirements to be provided for the individual in the modern dwelling must be first called to mind. These are in approximate order of greatest necessity: (1) sleeping, (2) food-storage, (3) cooking, (4) warming, (5) excretion, (6) ablution, (7) clothes washing, (8) deposit of refuse, (9) open space for drying clothes, &c., (10) bathing, that is not partial but total ablution of the body, (11) living, including reading, writing, work, recreation, &c., for brevity called living. The list might be continued to a considerable extent, but that some limit must be placed by restricting it to what is more necessary rather than to what would be most desired.

In the next place it is advisable to picture the possibilities, whether desirable or not, of the case of a single individual living in one room. Diogenes was contented in a tub, but such a dwelling would be promptly represented as unfit for human habitation. Nevertheless, many single persons live in one room, so let us glance at the interior of such a dwelling, the purposes it subserves, the provision made for these purposes, and the provision that would be required if separate rooms or places were provided for these purposes. In order to make this aspect clear, let us throw this into tabular form in the simplest manner.

Too strong an emphasis, cannot, therefore, be laid upon the great fact that above all things in providing dwelling accommodation healthy family life must be most encouraged and bettered, and that no amount of collective accommodation for men only or women only will touch this great question.

It is at once apparent that the differences of sex and age are the factors that render family life impossible in a single room, and that in the erection of dwellings for families single-roomed dwellings are out of consideration. We must, therefore, start with the two-roomed dwelling, the very minimum family accommodation possible, and it must be recognised that family life entirely carried on in two rooms cannot be regarded as the standard of "home" in which the bulk of the young population of the nation should be reared and trained as future citizens, however humble their walk in life.

As both of these rooms may sooner or later require to be used as bedrooms we must further consider how the second room may have removed from it such provision as may be made elsewhere. If we refer to the tabular statement we shall see at a glance that food storage, cooking and warming, ablution, and clothes washing, may be so removed to a combined kitchen, larder, scullery, and washhouse, and so we reach a three-roomed, self-contained dwelling. The possibility of installing a food cupboard, a cooking range, a draw-tap and sink, and a washing copper in the same room must be admitted.

The combination of kitchen, larder, scullery, and washhouse has this great disadvantage, that the room being applied to so many purposes it cannot well be used for any other. The separation of this into two rooms, a scullery and a kitchen, enables the kitchen to be freed from the other purposes and to be usable as a living-room, this in turn dispensing with a bedroom being so used, as must of necessity otherwise be the case. Here then we reach the four-roomed self-contained family dwelling.

During the twenty years 1871 to 1891 there was a continuous and increasing diminution in the proportion of persons living in dwellings of one room, and of five rooms and upwards, to the total number of persons living in all dwellings, this being especially marked in the case of the one-room dwellings. On the other hand, there was a steady increase in the proportion of persons living in two, three, and four-room dwellings during the twenty years; the persons living in four-room dwellings, as well as those in three-room dwellings, showing a continuous and increasing proportion, the greatest gain of all being ultimately in the three-room dwellings. But the remarkable point is that, whereas in the decennium 1871-81 the proportion of persons living in two-room dwellings increased 3·2 per cent., and the proportion in three-room 2·8, in the decennium 1881-91 the proportion in two-room dwellings only increased 2·8, whereas the proportion in three rooms rose 3·7 per cent.

Above all towers the notable fact that the proportion of persons living in one room dwellings fell between 1871 and 1891 from 30·4 to 18·0 per cent. of the total number of the population, and it is significant that the increase of proportion appears to be converging towards the three and four-roomed dwelling.

Unfortunately no such valuable comparative figures are available for England and Wales, or any English towns, Dr. J. B. Russell's method having only been adopted at the last census in 1891. At that census the table on the next page shows the percentage of population living in tenements of one, two, three, and four rooms in the whole of England and Wales, in the rural districts, in the urban districts, in St. Luke's, one of the most crowded, and in Lewisham, one of the least crowded districts in London.

Comparing the St. Luke's figures with those of Glasgow in 1891, the former had about the same proportion of population housed in three rooms, and a slightly larger proportion in four rooms, a very much larger proportion in five rooms and over, and a much smaller proportion in two rooms, but a somewhat larger proportion in one room.

Comparing Lewisham with St. Luke's, the great difference is that in Lewisham 53·8 per cent. less of the population live in one and two rooms, and 56·8 per cent. more in five or more rooms than in St. Luke's. This, no doubt, is due to the difference between the classes inhabiting a semi-rural and choice residential suburban area, as compared with a crowded central area in a large city.

The normal proportion of urban population living in several roomed dwellings it would be extremely difficult to estimate, dependent as it must be upon the size of the rooms, and the number of rooms in the houses. This applies particularly to the one-roomed and the five or more roomed tenements, since common lodging - houses, homes, boarding - houses, hotels, clubs, and other houses in which more or less associated life is led, must largely diminish the proportion of persons living in one-roomed and correspondingly increase the proportion in five or more roomed dwellings, but amongst the bulk of the population would have less effect upon the proportion living in two, three, or four rooms, that is, humble family life.

To revert again to our ideal self-contained large family dwelling of four rooms, namely, two bedrooms, a kitchen and living room, a scullery, washhouse and larder, and a w.c., with yard or balcony, is it possible to reduce the number of rooms to economise upon the rent? It is plain that if the family is very small, one bedroom may suffice, and the

Purposes.	Provision in a Single Room.	Provision in Separate Places.
1. Living .....	Table and chairs .....	Parlour.
2. Sleeping .....	Bed .....	Bed-room.
3. Food Storage .....	Cupboard (ventilated into open air).....	Larder.
4. } Cooking and }	Range.....	Kitchen.
5. } Warming }	Draw-tap and sink .....	Scullery.
9. Ablution .....	Wash-tub .....	Washhouse with Copper.
7. Clothes washing .....	Bath or tub .....	Bath-room.
8. Bathing .....	Pail .....	Bin.
9. Deposit of Refuse .....	Window cill .....	Yard or Balcony.
10. Open Space (for drying clothes, storing refuse, &c.).....	W.C. ....	W.C.
11. Excretion.....		

(The last must in any case be separately provided for.)

It will be at once apparent that it is possible to cram all these purposes and appliances into a single room *except the last*, and it is much to be regretted that in our cities and large towns endless illustrations of this condition are to be found, under which not only individuals but whole families exist, for they can scarcely be said to live in the true sense of living.

These are nothing but mere truisms; nevertheless, something is gained in setting out in detail what we have to deal with, and being able thus to picture the position. It enables us from this basis to proceed step by step to what we are aiming at—namely, to form some idea of the provision necessary to be made for those who cannot and know not how to provide for themselves.

Existence in a single room for a single man or a single woman may be possible, but for families whose children will become future citizens and form the bulk of the nation it is utterly impossible without degradation and decadence. From a social and national point of view, therefore, the celibat whose existence terminates with life becomes of infinitely little consideration beside the families that carry on the nation from generation to generation.

In this direction happily it is that progress is being made, and in proof of this some figures of Dr. J. B. Russell, the well-known Medical Officer of Health of the City of Glasgow, who has done so much good work in this direction, may here be quoted. In a digest of the "Census, 1891, Glasgow," he records the percentage proportion of the population living in dwellings of one, two, three, four, and five, or more rooms in that City, at successive census periods; to these I have added columns showing the percentage increase or decrease, and the results as set out in the following table are of extreme interest:—

Dwellings of.	Census, 1871.	Difference 1871—81.	Census, 1881.	Difference 1881—91.	Census, 1891.	Difference 1871—91.
1 Room .....	30·4	— 5·7	24·7	— 6·7	18·0	— 12·4
2 Rooms .....	41·5	+ 3·2	44·7	+ 2·8	47·5	+ 6·0
3 " .....	13·2	+ 2·8	16·0	+ 3·7	19·7	+ 6·5
4 " .....	5·8	+ 0·3	6·1	+ 1·1	7·2	+ 1·4
5 " and upwards .....	9·1	— 0·6	8·5	— 0·9	7·6	— 1·5
	100·0		100·0		100·0	

number of rooms be reduced to three, constituting what may be regarded as our ideal self-contained small family dwelling.

Now comes the question—can any further reduction be made and how? At some sacrifice of family life and independence in the construction of buildings containing numerous dwellings another room may be lopped off by setting the larder in the kitchen wall opening to the air, and constructing a scullery and washhouse for the common use of several families, and where this form of construction is adopted the w.c.'s are treated in a similar manner. In some cases the scullery is also separated from the washhouse, the scullery being placed close to the dwellings and the washhouses collected together at a distance. This class of dwellings may be better known as associated dwellings in contra-distinction to self-contained dwellings. It is important that

Dwellings of.	England and Wales.	Rural Districts.	Urban Districts.	St. Luke.	Lewisham.

the water-tap and the w.c. should be as nearly accessible to the dwellings they serve as possible, in every case on the same floor of the building, and that such provision should be made for every twelve occupants or less. It is almost unnecessary to add that the water supply and drainage should strictly conform with official regulations, for in buildings where the number of occupants is multiplied the danger incident to defects is proportionately increased.

We have now reached a point at which it becomes apparent that in providing family dwellings we may differentiate between two classes of houses constructed in separate dwellings or common-stair dwelling-houses, the one consisting of three and four room self-contained family dwellings, the other of two and three-room associated family dwellings. I venture to think that wading through these details is amply repaid by the clearer conception we obtain of the conditions to be provided for in new dwelling-houses in crowded cities.

1. Single or widowed individuals of the same sex (a) living and sleeping in common, or (b) living an associated life in one dwelling-house.

2. Families living in associated dwellings in one building, partly a family life, partly an associated life.

3. Families living a truer family life in self-contained dwellings in a common-stair house.

Some points with regard to perfiation and ventilation must not be overlooked here Dr. Arthur Newsholme some years ago, in a paper read before the Royal Statistical Society, showed that in London houses constructed in separate dwellings, or common-stair dwelling-houses, appeared statistically not to have any particular influence upon health except in this respect, that they produced a greater prevalence of those forms of infectious diseases for which there is no hospital provision, such as measles, whooping-cough, &c. The lesson to be learnt from these statistical researches is that the staircases and passages of such houses must be so constructed as to be fully and permanently open to outer air. This necessity is the more obvious when it is pictured that the separate dwellings all open on to the common stair and passages, and that the dwelling rooms of each dwelling are also all in direct aerial communication with each other and are not separated by a ventilated staircase-well, as in the older type of house.

The statistical researches of Dr. Tatham, Superintendent of Statistics at Somerset House, when Medical Officer of Health for Manchester, into the mortality and morbidity of back-to-back houses, furthermore point to

the necessity for having through ventilation to each dwelling; that is, that a back-to-back type must not be adopted, but that one or more of the rooms must be situated on the opposite front of the building to the other room or rooms, so as to allow of thorough perfiation when windows and doors are opened.

In this connection it need scarcely be added that no w.c. should have direct aerial communication with any room of a dwelling, and especially where the rooms are in direct aerial communication with each other, and, furthermore, that every dwelling should have close access to a modicum of open space in the form of a yard or balcony wherein to place refuse or any objectionable matters, and for other purposes. In planning this open space may be made the means of cutting off the w.c. from aerial communication with the dwelling.

As to open spaces at the front and rear of

the building it is now accepted that these should be as wide, and may be as wide again, as the height of the house.

It may be convenient to add at this stage that although occasionally large tubs and baths may be seen in use in the class of dwellings under consideration, the inconvenience of restricted dwelling space militates against them. The erection of baths in corridors and spare corners has not met with successful application, and the only provision that appears to succeed in large blocks of separate dwellings is the erection of a separate building fitted with baths and furnished with hot and cold water under the care of an attendant. To this building also may be conveniently added another containing the washhouses of associated dwellings.

Now we come to the question of cubic space, and this divides itself into (1) the cubic capacity or size of dwelling-rooms, and (2) the cubic space per head.

Although it has been necessary for the purpose of lucid description to regard a scullery and washhouse as a room, it is not a fit place for living or sleeping in, and cannot be included in the term dwelling-room.

One of the principal points governing the size of dwelling-rooms is the means of ventilation, and the smaller a room the greater the difficulty of ventilating it, so that restriction must be placed upon the reduction of size in new buildings. The standard height now generally adopted is 9ft., and the minimum area 96 square feet, say 12ft. by 8ft., or 11ft. by 9ft., or 10ft. by 10ft., a cubic capacity of something under 900 cubic feet.

The cubic space per head is the most difficult point of all to deal with in practice, and must be regarded sanitarily as the most important.

In 1851 the Common Lodging Houses Act was passed, which placed the control of common lodging houses in the hands of the police with power to make bye-laws. At this period there was no doubt some difficulty in fixing the minimum amount of cubic space per head to be enforced, and it appears to have been fixed successively at 240, 260, 280, and 300 cubic feet, at which point it stands at present. It would be interesting to know how this amount was reached, and it is a curious coincidence that if we measure a bedstead 6ft. long with a 2ft. gangway at the bottom, and 2½ft. wide with a 1½ft. gangway at the side, we arrive at an area of 8ft. by 4ft., the minimum amount of floor space in which it is possible to put an approachable bedstead, and if this be multiplied by 7½ft., the minimum height probably adopted at that period, since cellar dwellings of a less height than 7ft. were illegal, we arrive at a cubic space of 240 cubic

feet, and it requires but the addition of a few inches to each dimension to raise this space to 260, 280, and 300 cubic feet. It is highly probable, therefore, that this minimum was a purely mechanical calculation in packing, the requirement of the human subject being overlooked.

Three hundred cubic feet still remains the minimum standard of cubic space for sleeping rooms. It is true that a recent Factory and Workshop Act only provides for 250 cubic feet per head, but a person awake has more control over the condition of the air breathed than a person asleep for, perhaps, eight hours at a stretch. The Local Government Board's Model Bye-laws provide for 400 cubic feet in tenement rooms, used both for living and sleeping, and the 300 is recommended to be increased in the dormitories of common lodging-houses that may require it.

Many years ago the late Dr. Edmund Parkes showed that, calculated on a physiological basis, the human adult required 10,008 cubic feet of space, because, in order to maintain the air in a sufficient state of average purity in a dwelling-room, it was necessary to supply 3000 cubic feet of air per hour, and the air in this climate could not be changed more often than three times per hour.

We are continually bemoaning the large death-toll of consumption, or tubercular phthisis, essentially a disease spread by crowding, and the medical profession is now strongly advocating the cure and mitigation of the disease by fresh air treatment. Is it out of place to advocate even more strenuously the prevention of the disease by fresh air, by the provision of more cubic space, and especially by raising the present inadequate minimum standard?

The adoption of the maximum as a working standard is scarcely practical, but it is practicable to advance the minimum standard to 400 cubic feet at the very least in all cases, and if the lauded fresh air treatment means anything, it means a decided step in this direction.

A standard of two persons per room is adopted in schemes for re-housing, and in census returns for measuring overcrowding. With regard to the latter, it gives no idea of the amount of cubic space per head, inasmuch as the sizes of the rooms are not known. In reference to the former, to design dwellings allowing five, six, or seven hundred cubic feet per head, without providing any means of preventing this allowance to be reduced, is practically futile.

The matter of cubic space is above all important in re-housing under the Housing of the Working Classes Act, 1890, and the granting of certificates of suitable accommodation and sanitation under the Customs and Inland Revenue Acts, 1890 and 1891, which practically means the building of new dwellings for the working classes in large towns. To erect and certify buildings is one thing, to prevent them from being used other than in the manner intended is quite another thing; and we are living in a fool's paradise if we think that we are going to succeed in providing the working classes with more breathing space without having the means of preventing it being compressed to its original proportions. The pressure of population inevitably tends to squeeze the people closer and closer together, and the only check to this disease-producing pressure is a minimum limit imposed by law and vigilantly enforced by inspection. If we raise the standard of construction in the matter of cubic space and do not also increase the minimum limit to prevent crowding, pressure of population will in time inevitably reduce the condition of new dwellings to that of old, and the vast expenditure of time and money throughout this country will have been in vain. I plead for this increase.

The New Schools, Arlecdon, Cumberland, are being warmed and ventilated by means of Shoreland's patent Manchester grates, patent exhaust roof ventilators and inlet tubes, supplied by Messrs. E. H. Shoreland and Brother, of Manchester.

## Masters and Men.

**Bradford painters** have gained  $\frac{1}{2}$ d. per hour advance, and double pay for night work.

**Elgin quarrymen** have gone out on strike; they want an increase of pay and shorter hours.

**Barnstaple Bricklayers** struck last Saturday week for 6d. per hour. The masters have offered 5 $\frac{1}{2}$ d.

**Dumfries Masons' Strike.**—About eighty men have left the town, having obtained situations at a higher rate of pay than the 9d. per hour for which they were asking.

**The Painters at Carnarvon** are striking for 7d. per hour. The masters have met and have offered to increase the wages of the men from 5d. per hour to 6 $\frac{1}{2}$ d., but this has been refused.

In view of a general lock-out of all trades, the National Association of Master Builders have decided to approach the National Association of Slate Merchants and Slaters, to ascertain how far they are willing to co-operate with and assist them to suppress what they regard as the tyranny practised by the operatives.

**Engineers on the N.E. Coast.**—The representatives of the engineers belonging to the Amalgamated Society employed in the shipbuilding yards of the North-East Coast, had an interview with the members of the Employers' Association at their offices in Clayton Street, Newcastle, at which they asked for an advance of 7 $\frac{1}{2}$  per cent. on piece and 2s. on time wages. The interview lasted an hour and a half without any definite result being arrived at, and the proceedings were therefore adjourned.

**The Plasterers' Dispute.**—At a meeting of the Yorkshire Federation of Building Trades' employers approbation was expressed of the attempt to suppress what was called the constant tyranny practised by trade unionists throughout the country. On Monday last week, Mr. Deller issued a circular addressed to the Trade Unionists of the United Kingdom appealing for financial assistance to help the Union to carry on the struggle with the Master Builders' Association. After detailing the events which led up to the lock-out, order being enforced, Mr. Deller says:—"We are fighting the cause of Trades Unionism throughout the length and breadth of the land. Our fight is your fight. If we are beaten, your turn will surely come. We, therefore, appeal to you, as fellow trades unionists, to render us all the aid in your power, both morally and financially. At the present time only about 25 per cent. of our members are affected. We anticipate that the struggle will be a long one, but win we will if we can obtain from you that for which we ask. Without any aid whatever we shall continue so long as our funds eke out, and if we fail it will only be for lack of support outside our ranks. We make a special appeal to those connected with the building industries, to aid us not only financially, but by refusing in all cases to do that which, were there no lock-out, we would be doing." The movement of the locked-out men in Leeds to establish a co-operative plasterers' society has been successful; the whole of the necessary capital has been subscribed, and the new society has been registered. The men have secured a contract upon which they will soon commence working. It is stated that at the next meeting of the Standing Committee of the National Association of Master Builders some of the members intend to urge upon the committee the desirability of extending the lock-out order to other branches of the building trade. Several of the largest firms are of opinion that if they

are to win the struggle with the plasterers, the lock-out order will have to be applied to the other sections of the trade. This has become necessary in view of the fact that the lock-out of plasterers has so far resulted in only about twenty-five per cent. of the union men being affected. At a special meeting of the Council of the National Association of Master Builders, held in Manchester on March 29th, a letter was read from the secretary of the operative plasterers stating that the Union was still willing to meet the employers. This letter was received in a conciliatory spirit, and a reply sent to the effect that the masters would be willing that twelve of their body should meet a similar number of the men's representatives in London on April 6th.

**A Compensation Appeal.**—Lords Justices A. L. Smith, Collins, and Romer, on March 26th, heard the case, under the Workmen's Compensation Act, of Hoddinott v. Newton, Chambers, and Co., Limited, the masters' appeal from an award of the County Court judge of Wandsworth. The claimant was the widow of a deceased workman, who was at the time of his death in the employment of the appellants, who are builders. It appeared that a stable had been built for the London General Omnibus Company about six months before the time of the accident, and was occupied by the company. The appellants were employed by the company to put in stays fastening together the columns and girders of the stable. For that purpose three planks were placed on two trestles about 8ft. from the ground, and the workman stood on the planks while at work. At the time of the accident the deceased man was standing on the planks engaged in assisting to raise up one of the iron stays, when he overbalanced himself and fell off, and was killed. Two questions were raised—(1) Whether the building was over 30ft. in height, and (2) whether it was being "constructed or repaired by means of a scaffolding" within section 7, sub-section 1, of the Workmen's Compensation Act, 1897. The height from the ground to the parapet of the building was 28ft., and from the ground to the top of the roof the height was 35ft. The contention on the part of the employers was that, inasmuch as nothing was being done to the roof, the height of the building must be taken, as in section 5 of the London Building Act 1894 from the ground to the top of the parapet. It was also contended on their behalf that the building, if over 30ft. in height, was not being "constructed or repaired by means of a scaffolding," the work consisting of alterations to the building, and not repairs, and the arrangement of planks and trestles not being a "scaffolding." The County Court Judge decided both the questions in favour of the claimant, and awarded her £245 14s. as compensation. It appeared that the claimant had brought an action under the Employers' Liability Act, 1880, to recover damages, alleging that the planks and trestles were defective; but the County Court judge gave judgment for the employers in this action, and then, upon the application of the claimant, the Judge proceeded, under Section 1, Sub-section 4, of the Act of 1897, to settle the question of compensation under that Act. The judge, as above stated, awarded the claimant £245 14s. as compensation, but deducted from this sum the costs of the witnesses called by the employers in the action under the Employers' Liability Act, 1880. The employers appealed. Lord Justice A. L. Smith, in giving judgment, said the workman claimed compensation for injury he received while engaged in fixing some "stiffening irons" inside a stable that had just been finished by another firm of contractors, which the General Omnibus Company, for whom the stables were built, considered vibrated too much. The defendants pleaded in the court below, and also in this appeal, that the workman was not engaged on a building 30ft. high being either "constructed or repaired" by the undertaker, and also that the erection he was working on was not a "scaffold." In his opinion the masters' contention was well-founded, and their appeal would be allowed. The other lords justices concurred.

## Surveying and Sanitary Notes.

**Epping Sewage.**—In the House of Commons on March 23rd, in reply to Sir F. Dixon-Hartland, Mr. T. W. Russell (Tyrone, S.) said that the Local Government Board had received complaints on the subject of the sewage at Epping. The Urban District Council applied in November, 1897, for sanction to a loan for works of sewerage and sewage disposal, and also for a provisional order for the compulsory purchase of land for the scheme. This order was confirmed last session, but the District Council state that they have experienced difficulty in acquiring the land, and they are considering a different scheme from that originally contemplated. The Board are communicating with the District Council, urging them to proceed at once in the matter.

**A Blocked Drain.**—At the Greenwich Police Court, at the instance of the Lewisham District Board of Works, the Bungalow Building Company Limited, and their secretary, Mr. C. F. Vernon, of Chancery Lane, were summoned for making default in complying with a notice to abate a nuisance in a drain, at 4, Eastern Road, Brockley. The magistrate, holding that the liability attached to the occupier, and not to the owner, dismissed the charge, with three guineas cost.

## Builders' Notes.

**Dispute between an Architect and a Builder.**—In the Chancery Division before Mr. Justice Cozens-Hardy, on March 27th, Mr. Warburton sued for an interlocutory injunction to restrain the Llandudno Urban District Council from preventing him from carrying out a contract for the erection of large municipal buildings at Llandudno. The plaintiff was the contractor for the works, and had commenced the building operations; but disputes had arisen between him and the defendants' architect, which resulted in the District Council turning the plaintiff off the site. The plaintiff alleged that the architect of the defendants had been very obstructive, and had raised points which he refused to comply with, as he alleged them to be outside the contract.—Mr. Justice Cozens-Hardy dismissed the motion with costs, holding that the plaintiff's remedy was in damages, and not by way of injunction. He did not, however, decide anything on the merits of the case as between the plaintiff and defendants.

**Measurement of Lathwood.**—The Board of Trade have received information (through the Foreign Office) from Her Majesty's Consul at Riga that, in consequence of the frequent litigation which has lately attended the shipping of lathwood from that port, a meeting of Riga exporters was held on the 3rd inst. for the purpose of discussing a scheme designed to check the claims for short measurement which are continually being sent in by English buyers. A resolution was adopted by all the firms represented at the discussion, embodying the following regulations:—(1) A measurer will be appointed, whose duty it will be to control the measurement of the lathwood to be shipped, to see that the said measurement is correct, and to hold himself responsible to the shipper for correct shipment; (2) the measurer will issue a certificate for each parcel of lathwood shipped, stating the exact measure in fathoms, and this certificate will be attested by the British Consul; (3) the exporters bind themselves to buy only from those dealers who allow the shipments to be made under the control and certificate of the sworn measurer; (4) the exporters bind themselves to sell lathwood to Great Britain only on condition that the buyers accept Riga measurement; (5) the exporters bind themselves not to make any

shipment of lathwood save under the control of the sworn measurer and the attestation of the British Consul."

**Paving Accounts.**—Before his Honour Judge Greenhow, at the Leeds County Court, on March 28th, the Leeds Corporation brought an action against Mr. Seth J. Stott to recover the balance of an account due for paving and flagging Brunswick Terrace, Camp Road. The Corporation had, in the ordinary way, made an order for the paving and flagging of the street, and upon the owners making default they themselves carried out the work. The proportion payable by Mr. Stott, as settled by the city engineer, was £68, but he contended that the apportionment was made on a wrong basis, and he according paid the sum of £60, which he admitted to be due. Brunswick Terrace is a street of irregular width, and opposite Mr. Stott's property it is narrower than at other parts, and he contended that the notice served upon him was to pave to the middle of the street in front of his own property only, and that he should pay such proportion of the charges as referred to that portion of the street. The Corporation, on the other hand, submitted that under their Local Acts the whole length of frontage to the street had to be taken into consideration, and that the narrower or wider portions were not to be taken into account in making the proportionment. After considerable legal argu-

ment, his Honour gave a verdict for the Corporation, with costs. He added that he did not know whether the defendant wanted to go further, but if did he would give leave to appeal.

Engineering Notes.

**A new Electric Tramway**, invented by Mr. Murphy, is being tried at Manhattan Beach, New York. It requires neither overhead wire nor underground conduit.

**Barrow Electric Lighting.**—At a meeting of the Town Council it was decided to apply to the Local Government Board for power to borrow a sum not exceeding £15,000, for the purpose of extending electric lighting.

**Electric Light at Cambridge University.**—The adoption of electric light for the Senate House has been recommended after designs and specifications by Mr. T. G. Jackson, R.A., at a cost of £400, exclusive of architect's commission.

**Wireless Telegraphy** has been successfully used between France and England. The station on the English side is situated at the South Foreland Lighthouse, near Dover, and

that on the French side at the Chalet l'Artois, Wimereaux, near Boulogne.

**English Iron Orders for America.**—The sending of orders to America of late has been by no means confined to one particular branch of the iron trade. The cases of the Great Northern Railway engines and the Soudan Railway engines are but types of a very large number of instances in which the impossibility of getting promptly supplied at home has driven customers to the United States. There can be little doubt that the engineers' strike of a few months back is mainly responsible, and that the period during which British works were idle would have been ample for the completion by home firms of orders nearly approaching in bulk the work which has lately gone elsewhere. Apart from the strike period and its effects, there is nothing in the position to the detriment of British trade, and the fact is pointed to that only surplus work is, generally speaking, being sent away. The British factories have now plenty of work, and there seems good reason to hope that, when the leeway resulting from the strike has been made up, little more will be heard of huge orders being sent out of the country. It appears that of all branches of the iron trade the rolling mills feel most keenly the existing overpressure, but naturally there is a serious collateral effect on practically all other branches.

## An Architectural Causerie.

### The Way About London.

LONDON, we know, *ad nauseam*, to be the richest city in the

world. We also, in these latter days of phenomenal expansion, know it to be the poorest in methods of communication; in ways by which the East may reach the West, and the North shake hands with the South, without needing the better part of a day, and the changing from tram to 'bus, from 'bus to train, and so back to tram again, to perform the feat. There are few sorrows so poignant as those of the divided members of a family who live, say at Hornsey and at Tooting; at Clapton and at Kingston-on-Thames. Better for their chances of again seeing one another in this life if they lived, not those ten miles apart, but at either end of the fifty miles dividing London and Brighton. They could do *that* journey in an hour; how long they would be in performing those between the other parts we have named we will leave to the industry of our readers to determine. We have neither the will nor the patience to essay the task ourselves. The worst of this is that the difficulty—nay, the impossibility—of at present being conveyed swiftly and cheaply between distant parts of the metropolis seems in no way of being adequately remedied, although we have at the present time no fewer than three great urban railways in progress, a fourth opened less than a year ago, and several others projected. The fact is that, so long as railways are projected as separate financial schemes, instead of being all related in one ordered whole, they will only be constructed along the most crowded courses of traffic, leaving the more speculative backwaters of the suburban life exploited only by the fugitive and uncertain 'bus. It will be a great convenience, when the Central London Railway is opened at the close of this year, to be able to travel in twenty minutes from the Bank of England to Shepherd's Bush, without the usual fight for a seat, which may be witnessed at the stopping-places of the 'buses, on any wet evening, along Holborn and Oxford Street; but when the trains full of passengers reach Shepherd's Bush the same contest will be waged in the teeming rain among those who want to go on to Gunnersbury or to crowded Acton and Ealing. As for the Baker Street and Waterloo Railway, now under construction, that is frankly being made for the convenience chiefly of railway passengers who want to travel between those two great trunk lines, the Great Central and the London and South Western Railways. We really owe much of our troubles in this matter to the Houses of Parliament, erroneously supposed to sit and slave at Westminster for the welfare of the public. It will be scarcely credible to many who read these lines (but it is the simple fact) that London possessed no local railways whatever until the first section of the Metropolitan Railway was opened, between Edgware Road and Farringdon Street in January 1863. That railway was originally sanctioned in 1853, by

what was then called the "North Metropolitan" Railway Act. That the Metropolitan Railway should ever have been called the "North Metropolitan" sounds humorous to-day, when we might fitly name a new line at Finsbury Park or Holloway in such a manner. Thus, railways had been making in different parts of the country and to termini in the then suburbs of London, since the early '30's, but not until 1863 did London possess a solitary line of its own. Attempts had been made long before, but the jealousy of the great London landlords, which had prevented the termini of the trunk lines being

for wayleaves. To-day the state of the law is such that it is fully recognised that the landlord has no claim to be consulted as to subterranean railways projected through the subsoil of his property; always, of course, supposing that the works are to be situated at such a depth, and constructed in such a manner, as not to interfere in any way with buildings situated or likely to be built above. This principle was re-affirmed by a committee of the House a few weeks ago, in the course of hearing the Hampstead, Euston, and Charing Cross Railway Bill, when the Duke of Bedford's claim for notice to be

SECTION OF END BAY. THE BANQUETING HOUSE, WHITEHALL. INIGO JONES, ARCHITECT.

placed in town, sufficed, through their interest in Parliament, to kill all other London railway bills. They were afraid for their property. To-day the most of them would for the sake of increasing the value of their freeholds, only too gladly welcome fresh schemes; but these are the days of improved subterranean tunnelling; of the Greathead Shield and the air-loch, rendering obsolete the old "cut-and-cover" system, which once paved the way for large compensation claims and payments

given him in respect of such portions of that undertaking as passed beneath his Bloomsbury property was disallowed. This will be a factor which will make for the projection of new railways where, under the old *regime*, the sums to be paid to property-owners would have been absolutely prohibitive. It is only in surface railways that room for this form of plunder is now left, and London is likely to see very few more of such lines.

C. G. H.

## On Reflection.

**The London Building Trades.** IN May, 1897, the Technical Education Board of the London County Council appointed a special sub-committee to inquire into "the educational requirements of members of the building trades, and the provision at present existing." The report of the committee, which has just been published, contains much food for reflection for all who are in any way concerned in the building trades of London. The committee examined twenty-nine witnesses, most of whom were specially qualified by their position and experience to throw light upon the subjects under inquiry. Among those who gave evidence were architects, builders, technical teachers, builders' foremen, and trade union officials; and with such a multitude of counsellors, though there might be wisdom, it was not to be expected there would be unanimity. Nevertheless, the inquiry has disclosed certain clear and undisputed facts which had not perhaps hitherto been generally suspected. Prominent among these is the almost startling fact that the doors of the building trades in London are practically closed against London boys. London builders as a rule do not want apprentices, and will not take them except on payment of a heavy premium, sometimes, indeed, not even then. An extract from an earlier report which is quoted by the sub-committee shows that in 1895 there were found to be, among 12,000 employés in various branches of the building trades, only eighty apprentices and 143 "learners," instead of 1600, which would have been about the normal proportion. In some cases it is the workmen themselves who seem to be responsible for the limitation of the number of apprentices, but more often it is the masters. Mr. George Cole, secretary of the London district of the National Association of operative plasterers, stated that in the plastering trade he thought there were only about ten apprentices in the London district within a radius of twelve miles. He had gone round to employers offering a premium of £25, but they would not have an apprentice. Five years ago he approached the master builders and found there were no boys in the trade and no builders affording any facilities for them. It will be remembered that one of the "objectionable practices" alleged against the Plasterer's Union was that they have refused to allow the employment of apprentices; it is evident from this report that such a charge is entirely without foundation as far as London is concerned.

**The Training of Artisans.** THE reasons for the employers' attitude on the matter of apprenticeship are intelligible enough. Rents in London are so high that every square yard in a workshop must be made to produce the most valuable output possible; a lad who is just beginning to learn his trade and whose productive capacity is practically nil, takes up as much room at a bench as a skilled craftsman. Again, there is the difficulty of discipline. Your apprentice may be lazy or "cheeky," but you cannot "sack" him, at least not without considerable trouble. This difficulty does not apply to the "learners," who, being liable to instant dismissal for misconduct, are more amenable to discipline; but that system is open to serious objection in another direction. In some shops, it would appear, the learners pay a fee to the

foreman and are directly under his control, the tendency of this system being for the learner to be dismissed without due cause in order that the foreman may take another fee from another learner. As a general rule the London building trades are recruited from the country; very few of the skilled workmen at present engaged by London building firms learned their trade in London. Altogether it is a bad lookout for the London boy, and considering that the equivalent of a fair-sized town is added to the Metropolis every year it seems hardly fair that the Londoner should have scarcely any share in the building of it. A large part of the evidence before the Committee related to the existing provision for technical education in the building trades in London, and it was shown that in this important matter steady, if not very rapid, progress is being made. But it must not be supposed that the training given in technical and technological classes can be regarded as an effective substitute for the declining system of apprenticeship. The technical school will not open the door of a trade to the boy who wishes to enter it; once he is inside it will help him to become a more intelligent and more efficient workman, but it is a rule in the majority of trade schools, polytechnics, &c., to limit the instruction strictly to those engaged in the particular trade concerned. Moreover, the technical schools are not capable by themselves (it is no disparagement to them to say so) of turning out thoroughly skilled craftsmen; the actual conditions of commercial work cannot possibly be exactly reproduced in the classroom and the college workshop.

**The Committee's Proposals.** WHAT then can be done for the London boy who aspires to becoming a skilled joiner, plasterer, or mason? There is no one to pay high premiums so that he may be apprenticed in London, and he can hardly be expected to go into the country to learn his trade and then come back to London. The Committee, of course, were only indirectly concerned with this problem. Their business was primarily to consider the question of technical education. But there can be no doubt that in the recommendations upon which they agreed, they were largely influenced by the decline of the system of apprenticeship, and the consequent passing of the London building trades out of the hands of London workmen. There are seven distinct recommendations in the report, and the idea underlying them seems to be this: if the masters will not take raw lads and train them till they become skilled workmen, we must arrange for a large part of the training being done by other means; let the system of technical education be so extended and improved that a lad may enter his trade at the age, say, of seventeen, not indeed a fully skilled artisan, but having acquired such a degree of skill that it shall be worth while for an employer to take him without a premium, and to pay him a reasonable wage. To this end the Committee would raise the legal age for leaving school, and give the boy between the ages of thirteen and fifteen increased opportunities for manual training and drawing. After that he might have a couple of years' training in day classes at a polytechnic. The Committee would break down the present exclusiveness of the technical classes; anyone who is capable of profiting by the instruction afforded should be allowed, they suggest, to attend theoretical classes, and a mechanic in any branch of the building trade should be allowed to attend both theoretical and practical classes in other branches of the building trade; the practical classes should be open also to learners and improvers under nineteen years of age. With a view to increasing the practical value of

the instruction given it is suggested that committees consisting of operatives, foremen, and employers in each trade should be appointed to visit classes connected with the Technical Education Board and report to the Board as to their efficiency, and make suggestions for their improvement. As to the teaching, it is suggested that more stress should be laid on methods which secure mechanical skill and quickness of workmanship, and that the teachers should, as far as possible, be actually engaged in the trade in which they give instruction. These suggestions seem eminently reasonable and practical, and there should be little difficulty in carrying out all of them, except perhaps, the raising of the legal age for leaving school, that of course involves parliamentary action; and public opinion, we fear, is hardly yet ripe for a change in that respect. However, it must come in time, and the sooner the better, for it will inevitably tend to produce a superior type of workman. The system of apprenticeship is not likely to be revived to any great extent, and it is to technical education that we shall have to look more and more for the training of intelligent and skilful craftsmen.

## A "BUILDERS' JOURNAL" COMPETITION.

### DESIGNS FOR A COUNTRY HOUSE.

IN accordance with our announcements in the last two issues of the BUILDERS' JOURNAL, we have arranged a competition, to be open to all our readers, for designs for a country house. As the competition is intended to meet the requirements of an individual correspondent, we append a statement of his wishes and, in making the awards, preference will be given to designs which most nearly comply with the following requirements:—

"I want a house long and low, with a large square entrance hall, to be used as a comfortable sitting-room, a wide staircase, and a gallery going partly round hall, a dining-room and boudoir for a lady, about six bedrooms, and three servants' rooms, with comfortable offices, &c. I want something a little unusual, either dark stained wood and thatch, or old timbers and thatch, and all kinds of angles and windows."

There is no limit as to the size of the site, nor yet as to price, but needless extravagance must be avoided.

The designs submitted may include a perspective view, as well as plans and elevations, and must be accompanied by a brief specification. They may be drawn to any convenient scale, but must be inked in and be without colour or wash.

Drawings must be despatched so as to reach the Editor of the BUILDERS' JOURNAL not later than May 10th; they must be submitted under a motto, accompanied by the name and address of the competitor, in a sealed envelope.

Premiums of £10 10s., £5 5s., and £2 2s., will be awarded for the three best designs. The services of a well-known architect will be secured to act as assessor. The three premiated designs will be forwarded to our correspondent, who may commission the carrying out of one of them; but it must be understood that our responsibility in the matter ends with the payment of the premiums.

The drawings will remain the property of their authors, but we reserve the right to reproduce any we think fit.

## SOME NOTES ON THE WORKS OF INIGO JONES.

By H. INIGO TRIGGS, A.R.I.B.A.

(Continued from No. cxxvi., page 116.)

THE earliest signed design by Jones is one in the Duke of Devonshire's collection, dated 1616. In 1617 he prepared designs and a model for a new Star Chamber at Westminster. This was one of his first commissions for the Government. The drawings are now at Worcester College, Oxford, but were never carried out. In the same year he commenced a work at Greenwich, where he built the Queen's House, which now forms the centre of the Royal Naval School, for Anne of Denmark, Queen of James I. The buildings were completed by Henrietta Maria, wife of Charles I., and the date of completion, 1635, as well as the name "Henrietta," are still to be seen on the front of the building. The interior decorations were by Horatio Gentileschi, and one of his ceilings (much damaged) still remains in the saloon. Charles II. set about the rebuilding of the old Palace, and Webb was employed to assist Denham (Surveyor to the Works) in its reconstruction.

When Sir Christopher Wren in after years made his masterly design for the completion of the building, he followed, as probably only he in those days could have followed, the work commenced by Jones. There are some drawings of Greenwich in the Devonshire Collection dated 1637, but these were made by Webb.

In 1617 he also commenced the new chapel of Lincoln's Inn, which was consecrated in 1623. This chapel is the one certain instance of a design by Jones in Gothic, and has been said to have been designed in 1610, that is when the old chapel was demolished, and before he had arrived at his maturer manner. There is some considerable doubt whether the other Gothic churches often attributed to him, namely, the churches of St. Catherine Cree and St. Alban's, Wood Street, were designed by him.

There is no evidence that Jones was employed on any building at all prior to the appointment he was fortunate to secure as Surveyor of the Works to Prince Henry, who, as a keen patron of the arts, warmly appreciated the genius of his architect. In his official capacity he superintended the repairs and alterations to Richmond, Shene, and St. James's Palaces; but the appointment unfortunately was not to be of long duration, for the Prince died on November 6th, 1612, when Inigo Jones had held the office for only two years. His income suffered considerably by the Prince's death, and his prospects seemed none too favourable; but he appears to have saved money, and to have now become a man of independent means; moreover, he had several noble patrons, chief of whom were the Earls of Arundel and Pembroke and Lord Danvers.

About 1613 he made his second visit to Italy; the dates are surrounded with uncertainty, but he was undoubtedly in Rome in January, 1614, and there is an entry in his annotated copy of Palladio (in the British Museum): "In the name of God. Amen. The 2 of January, 1614, I being in Rome compared these designs with the ruins themselves, Inigo Jones." He writes later: "The stairs at Chambord I saw being in France, there are 2 ways to ascend y<sup>e</sup> small hath a waal w<sup>h</sup> windowes cut out, but this y<sup>e</sup> seems was discoursed to Palladio and he invented of himself this staires." In the book of Jones' designs published some time after his death, there is a staircase similar to that of Chambord, though on a larger scale.

Jones and his copy of Palladio were inseparable companions, he took it with him wherever he journeyed, even on his progresses as Surveyor of the Works, and notes of what he saw appear on many pages. He thus writes of the Temple of Jove, June 13, 1639:—"Clemente Scoltor Romano, told mee that the ruines of this temple is pulld all downe, to

have the marble by the Constable, Barbannos Collona, by the Pope's permission; this was the noblest thing in Rome, in my time. So as all the good of the ancients will be utterly ruined ear longe." By this time his fame seems to have spread abroad, and the Italians much appreciated his genius. Two buildings at Leghorn are pointed out as his, and some are also ascribed to him at Venice, but all on slender grounds.

On the death, in 1615, of Simon Basil, Surveyor of the Works, Inigo returned to England to take possession of the office of which the King had granted him the reversion. His salary was to be at the rate of eight shillings per day for his entertainment, eighty pounds per annum for his "recompense of

DETAIL FROM THE DESIGN FOR WHITEHALL PALACE. INIGO JONES, ARCHITECT.

availes," and two shillings and eightpence a day for his travelling expenses, together with a house, apparel, &c.

Evidence exists that the Earls of Arundel and Pembroke were active in bringing the merits of Jones before the King. The Earl of Arundel understood and was very fond of every description of art; the Arundelian marbles at Oxford, and his patronage of Inigo Jones, Vandyck, and Hollar, will long commend his name to Englishmen as a great patron of art.

Jones' new office kept him very busy. The many progresses of the Court kept him constantly employed, and the numerous palaces and manor houses required much attention.

In 1618 James I. appointed a commission "to plant and reduce to uniformitie Lincolne's Inn Fields." The commission consisted of Lord Chancellor Bacon and other distinguished

persons, assisted by Jones, who made the plan, and designed several of the houses on the west side, including Lindsey House and those houses which have the rose and fleur-de-lis on the pilasters. Private interests prevented the full execution of his scheme, a result which leads Mr. Stowe to indulge in the following reflections:—"From the terras in Lincoln's Inn Gardens we have a prospect of one of the largest and most beautiful squares in Europe, originally laid out by the masterly hand of Inigo Jones, and intended to have been built all in the same style and taste, but by the miscarriage of this and many other such noble designs there is too much reason to believe that England will never be able to produce people of taste enough to be of the same mind, or unite their sentiments for the public ornament and reputation."

These sentiments, uttered more than two centuries ago, unfortunately, would be as appropriate if uttered at the present day.

An oil-colour view of Jones' design for Lincoln's Inn Fields is preserved at Wilton House. The view is taken from the south, and the principal feature in the elevation is Lindsey House. This house may be regarded as one of the best examples of Jones' street Architecture; the proportion is admirable. The design consists of a rusticated basement and a ground floor, from which spring six Ionic pilasters, the caps being of a type frequently used by Jones, having a swag suspended between the volutes; surmounting the pilasters is a modillion cornice and balustrade, on which originally rested handsome vases. The balusters are of the long attenuated form so much affected by him, similar types of which may be seen on the Banqueting Hall and Ashburnham House. Between the pilasters are two rows of windows, those on the first floor surmounted by pediments, the centre one curved; those on the second floor are quite plain, and almost square. At the two angles of the courtyard are the red-brick piers, with vases which add so much to the picturesqueness of this side of Lincoln's Inn Fields. The house was originally built for Robert, Earl of Lindsey, General of the King's forces at the outbreak of the Civil War, and was long inhabited by persons of distinction, including the proud Duke of Somerset.

On Tuesday, January 12th, 1619, the old Banqueting House at Whitehall was destroyed by fire, and Jones was ordered to erect on the same site a building of the same character. He appears to have dealt with the matter with great promptitude, for in less than six months he had completed the design, had the ground cleared, and the foundation stone laid. Three years later, on March 31st, 1622, the building was completed, the total cost being £14,940 4s. 1d., which did not, however, include the cost of a new pier at Portland for exporting the stone, amounting to £700.

In the accounts Inigo's masterpiece is described as "A new building with a vault under the same, in length 110ft., and in width 55ft. within, and in height 55ft. within, the wall of the foundation being in thickness 14ft., and in depth 10ft. within ground, brought up with bricks; the first story to the height of 16ft., cut into rustic on the outside and brick on the inside; the walls 8ft. thick, with the vault turned over on great square pillars of brick, and paved in the bottom with Purbeck stone, the walls and vaulting laid with finishing mortar, the upper story being the Banqueting House, 55ft. in height to the laying on of the roof, with two orders of columns and pilasters, Ionic and Composite, with their architrave, frieze, and cornice, and other ornaments, also rails and balusters about the top of the building, all of Portland stone, with fourteen windows on each side, and one great window at the upper end, and five doors of stone with frontispiece and cartones; the inside brought up with brick, finished over with two orders of columns and pilasters, part of stone and part of brick, with their architectural frieze and cornice with a gallery upon the two sides, and the lower end supported upon great cartones of timber carved, with rails and balusters of timber, and the floor laid with spruce deals; a strong timber roof covered with lead, and under it a ceiling divided into

a fret, made of great cornices enriched with carving, painting, &c." It is difficult to account for the thickness of the walls given in this description, which seems impossible.

Nicholas Stone was the master mason employed, and he received 4s. 10d. a day. Charles I. gave Rubens, who was assisted by Jordaens, £3000 out of his own purse for paintings fitted to the ceiling in 1635. The end panels represent the British Solomon on his throne pointing to Prince Charles, who is being perfected by Wisdom, and in the other panel he is represented as embracing Minerva and routing Rebellion and Envy; the centre panel shows him trampling on the globe, and flying on the wings of Justice to Heaven. Vandyck was to have painted the walls with a history and procession of the Order of the Garter. The Palace of Whitehall was burnt down on January 2nd, 1698, but the Banqueting House was fortunately saved, and thus besides being the sole relic of a Whitehall that never existed except on paper, it is also the sole relic of a Whitehall that was.

The Banqueting Hall was the only portion

built of the colossal palace designed for James I. by Jones, and in fact was only one out of four similar pavilions in a vast scheme which was to have extended some 1150ft. towards Northumberland House and to have occupied the whole width between the roadway and the Thames.

Two sets of designs have been published for the complete scheme. Campbell, who published his set of plates in the "Vitruvius Britannicus" 1717-25, states that he obtained the originals, which he dates 1639, from Mr. William Emmett, of Bromley. These drawings are now in Worcester College Library. Campbell states that the Banqueting Hall was built in 1617, and on that account may hardly be trusted, indeed few, if any, of these drawings were probably the work of Webb. In 1727 William Kent published a set of plates from drawings in the possession of the Earl of Burlington which also appear to be the work of Webb. Campbell's drawings indicate a palace only about half the size of the subsequent design, the total dimensions being 630ft. by 460ft. Those given by Kent are for

a palace 1280ft. by 950ft., and are entitled, "The Ground-Plant for the Palace of Whitehall for King Charles ye First, taken," and the elevation "Upright for the Palace of Whitehall for King Charles ye First, taken," but "the front is to be arranged, according to ye ground plott." The meaning of this last provision was that it was to include Inigo Jones' Banqueting Hall already built.

From the reference to Charles I., it seems certain that he favoured the larger scheme, although Mr. Loftie affirms the contrary, doubtless on the evidence of Campbell, who describes his set of plates "as it was presented to His Majesty King Charles I. by the famous Inigo Jones, 1639."

The great central court in the design for James I. was 392ft. by 198ft., whilst in that accepted by Charles, this court is 800ft. by 400ft., the general plan, however, remains much about the same, though doubled in size. The elevation was symmetrical, the composition consisting of a regular façade with projecting blocks at ends and centres, carried up above the intermediate range of buildings. A commencement was made in 1619, when the Banqueting Hall was built, but although Charles I. made strenuous efforts between 1630 and 1640 to revive the scheme, there was no money available, and the increasing difficulties in which the King became involved put a stop to any possibility of carrying out this magnificent design.

Mr. Reginald Blomfield says of this design:—"The boldness and originality of Inigo Jones' conception is amazing. It has appeared from our survey of English Architecture of the sixteenth century how utterly wanting this art had been in what may be called Architecture in the grand manner—that is, Architecture on a great scale, and depending for its effect upon proportion and orderly distribution, that is, on the abstract and essential qualities of Architecture rather than on the accidents of detail. Throughout the Elizabethan age costly palaces had been built, such as Wollaton and Audley End, but not one of those houses can be said to embody any large architectural idea. They are more or less picturesque masses of building, tricked out with adventitious ornament, which might be shorn away without materially injuring the Architecture. The detail itself is usually wanting in refinement and distinction, and although these houses arrest our sympathy by their associations, considered from a purely critical standpoint they only rank as second-rate work. There was, in fact, no precedent whatever in England for such a building as Inigo Jones designed for Whitehall. The force of his genius is shown in the fact that almost at one effort, and without previous failures, he was able to create a finished masterpiece of design in a manner that was as yet quite unfamiliar in England. The Banqueting House, mere fragment as it is of a stupendous design, is to this day the most accomplished piece of proportion in England, and not inferior to the finest work of Palladio, and the great Italian masters."

(To be continued.)

**A New Bridge** is to be erected over the River Rom at Havering Well Fordway, Essex, at an approximate cost of £2200.

**The New Cottage Hospital at Colne**, which has been erected in commemoration of the Queen's Diamond Jubilee, and the foundation stone of which was laid last Saturday week, has cost £4,000. During the ceremony a stone, weighing about 4 cwt., fell on a man's leg and badly sprained it.

**London Smoke.**—The inspector appointed by the Coal Smoke Abatement Society made his first report to the committee at their meeting held at 6, Onslow Gardens, and it was decided to draw the attention of the vestries to the worst cases in their respective districts, and to proffer evidence and assistance if required. The hon. treasurer, Dr. des Vœux, was able to report a good result from the distribution of the circular stating the aims of the society, the membership having increased considerably.

DETAIL FROM THE DESIGN FOR WHITEHALL PALACE. INIGO JONES, ARCHITECT.

## NOVELTY IN ART.

By R. S. BALFOUR.

(Continued from page 129.)

BUT there are other deterrents to the productions of artistic novelties which we cannot overlook altogether. Consider the tendencies of the present age, the gravitation towards a complete social equality, the continual apeing of the manners and customs of one nation by another, the constant copying of the characteristics and peculiarities of one class by the representatives of a different one, which is gradually bringing us towards a dull and regular average level of thought and aspirations. This, indeed, is what we have to fear, this love of imitating the dress, the phrases and language, the mannerisms and amusements of our neighbours, fondly hoping that thereby we are gaining new things, while we close our eyes to the fact that the outcome of this inclination will carry us down, fettered by self-imposed restrictions, to the stagnant sea of a cosmopolitan level of intelligence. Must we not, therefore, strive to maintain intact our national conservatism, our ancient customs, and our national characteristics, free from foreign interference, preserve our language pure from imported words, our Architecture from the influence of alien styles, our music, sculpture, and painting, from that of other schools, hold to our ancient sports and pastimes, *not* for the purpose of precluding the introduction of new methods into our life, but in order that our individual and collective originality may be cherished, and that we may hold ourselves free from a hybrid equality and uniformity of mind.

If the value of objects depends on their rarity, then a plethora of beautiful things will engender a disgust for them. What then would be the result of each individual, community or nation enjoying similar or equal advantages; would it make for an artistic progress; would such a state of things bring about a keener emulation in the creation of new ideas? Or would not the knowledge that these same ideas, as soon as evolved, were to become immediately common to mankind, act as a restraining influence on their production, by fostering a spirit of personal irresponsibility; for man is by nature selfish, and will always desire to retain for himself any credit that is due to him for his thought and labour. If this be not so, that each individual desires to hold some advantage over the rest of us, then why are our patent office, our stationers hall, and similar institutions patronized by all and sundry?

Opulence is another factor that must be taken into consideration with regard to its influence on the production of novelties in Art. Like most of our luxuries, superabundance of wealth is as deplorable in its results as the total absence of it. It is not disputed that novelty and simple beauty are only possible up to a defined limit without wealth. Improvement has almost always been associated with, and accompanied by, an increased outlay, and investigation and experiment demand the expenditure of time and means for the production of any novelty. How many great discoveries and beautiful things are lost to us, how many great minds have succumbed still burdened with an undelivered message to mankind, because the means for necessary outlays were not forthcoming, because even their daily bread was lacking.

But wealth, so beneficial to the production of men's ideas and discoveries, when it is discreetly utilised, becomes equally prejudicial in its effects when lavishly applied. Just as great national wealth and power have invariably in history been the parents and forerunners of decadence and national obscurity, and just as in the individual vast acquired wealth tends to dull our brightest intellect, making it rare to see those keenest flashes of genius emanating from the race of Dives, so collectively great national wealth begets, in course of time, idleness, ease, and luxury; it dulls our perception of great ideals, and plays

DETAIL OF THE DESIGN FOR THE PALACE OF WHITEHALL. INIGO JONES, ARCHITECT.

havoc with our intelligence and best convictions. Thus when we find our minds impressed by a display of excessive magnificence, or by a redundancy of ornamentation, or a needless intricacy of design, and not by that cultured simplicity which is the finest attribute of artistic beauty; then immediately will become apparent to us the debasing influence which is exercised by great riches upon Art.

With regard to the value of education as a means of furthering the cause of freshness and novelty in Art, it may appear open to doubt if it really exercises any beneficial influence. True it enables us to appreciate more delicate distinctions and to cull a finer enjoyment and delight in beautiful things, and it also enables us to see those charms which are not apparent, and which might without sophistry be said to appear even blemishes in the eyes of the ignorant. Strange it is that education, facility for travel, and all the increasing means of communication, though they tend temporarily to broaden our minds, are really the means of destroying individuality, the very source from which new ideas are produced. Just as in real life it can only be the child who enjoys actual novelties, in that they are sensations appealing to him for the first time, so in proportion as our education advances are we deprived one by one of the causes which determine our enjoyment of novelty.

If this theory be correct, then it would seem that in Architecture our education has been already carried very far, and that our travelling studentships and our foreign sketching tours are hurrying us onwards to a still more nondescript and ineffectual style of building. Certain it is that true novelty in Architecture is practically non-existent. Our efforts at originality ceased to all intents with the dawn of the great Renaissance. How paradoxical it seems that this revival, this

"new life" which was then instilled into Architecture should also prove the death of that quickening spirit which alone can render progress possible.

Since that time we have wandered up and down among all the monuments which have been bequeathed to us. Our little digressions from the original models seem apparently to be due more to a lack of knowledge than anything else, for it is difficult to call to mind any architect who has not become what we call, somewhat illogically, "more scholarly" in advancing life, in that he strays less from the approved and well-beaten track, and returns to the more primitive stage of a closer imitation. It is almost invariably the young architect who starts forward in his career with new notions, and yet but few years pass ere he longs to recall those exuberances of his conception, and repents him earnestly of what was in reality an effort misdirected it may be, to assist in the severance of Architecture from its place in the category of the dead Arts. As the years of professional life increase in number the struggle for emancipation begins to relax. It seems hopeless to free oneself from the trammels of tradition, when ridicule is the only encouragement awarded. Truly the architect gets little credit for the infinite amount of thought which is absolutely indispensable when there is no precedent for guidance, when the composition is an experiment made in comparative darkness. Though such works usually earn some such term of reproach as "hideous," a word often indiscriminately and carelessly hurled at any fresh departure from the level road of commonplaces, yet surely those men who are willing to risk a professional reputation, who sacrifice their peace of mind, and who devote their energies to these experiments, even though they result in failures, surely they are

more worthy of praise. They are doing infinitely more for their Art than those who bask in the sunshine of public approval, because they offend no traditions, and because they hold themselves free from the dread eccentricity of originality. But few are those who can afford to express their individuality, for they are hampered by the necessity for gratifying the wishes, tastes, and opinions of those upon whom their livelihood depends. But he whom opportunity may favour, if he with sincerity of intention and earnestness of purpose works in this strain, has that within him which will make his work great. Every great movement has been heralded with ridicule, scepticism, and intolerance, and the fear of this surely is a reason why we make so little progress nowadays in Art.

(To be continued.)

**Chimes.**—A commencement has been made on the work of hanging a new chime of bells in the steeple of the Arbroath Parish Church. Messrs. Ramsay and Gordon are to execute the necessary masonry work, and Mr. J. Robertson, joiner, has the contract for the erection of the scaffolding.

## THE NEW ROYAL COLLEGE OF SCIENCE.

IN addition to the Westminster and Whitehall blocks, another important Government building is about to be erected. This is the New Royal College of Science, at South Kensington, of which we publish a perspective view, front elevation and plan. The architect is Mr. Aston Webb, upon whose well-deserved election to the Associateship of the Royal Academy we commented in a recent issue. The building is to be erected immediately facing the Imperial Institute, with which it has been designed to correspond in certain features. It will be of the same length and will be recessed from the roadway in the same way as the Institute; the entrance will be in the centre exactly opposite the entrance to the Institute, and the little domes at either end of the Imperial Institute will be repeated in Mr. Aston Webb's building. It is proposed to span the roadway with archway screens connecting the two buildings, and to erect a group of statuary in the circus that will be formed in the middle. The two buildings together

will thus form a beautiful and symmetrical group.

The new Science College will form another of the fine group of public buildings, extending from Cromwell Road to Kensington Gardens. Upon one great axial line there will be the Natural History Museum, the new Royal College of Science, the Imperial Institute, the Royal College of Music, the Albert Hall, and the Albert Memorial.

The new building will contain a chemical laboratory 88ft. by 84ft., a physical science laboratory, L-shaped in form, extending 60ft. either way, the science library removed from the art museum in the Cromwell Road, which will be placed in the centre of the building, as well as lecture rooms and other smaller rooms the arrangement of which is shown in the plan given on the opposite page. The new college will accommodate about 250 students; it will not supersede, but will supplement, the existing accommodation in the Exhibition Road, which has long been found quite insufficient.

## THE NEW WAR OFFICE.

IN our article last week on the new Government offices, the designs for which have lately been exhibited at the House of Commons we discussed at some length the principal features of Mr. Young's proposed War Office. Readers are asked, therefore, to refer to that article in connection with the illustrations we publish this week. The two elevations given in one of our double plates will convey, we think, a clearer idea of the architectural features of the new building than any illustrations that have yet been published. The plan printed on this page shows the extreme awkwardness of the site, and it is impossible not to admire the skill and ingenuity with which Mr. Young has overcome the many difficulties it presents.

## BRADFORD FIRE STATION COMPETITION.

IN our issue of March 15th we published the letter of protest addressed to the Bradford Corporation by a number of architects who took part in the recent competition for designs for a Central Fire Brigade Station. The following official reply has been received by the architects' solicitors:

Town Hall, Bradford, March 29th, 1899.

Dear Sirs,

Your letter of the 27th inst., has been laid before the Watch Committee, who direct me to inform you that, after full consideration, they have decided, without exercising the power reserved in the conditions to call in the assistance of an assessor, that the first premium shall be awarded to the alternative design No. 1, sent in by Messrs. Mawson and Hudson, Architects, of this city.

With reference to the protests of your clients I have to state as follows:

- 1.—That the first paragraph thereof is disposed of by the above selection.
- 2.—That the shortness of the time allowed for a public view of the competitive designs which were not premiated was entirely due to the fact (as already intimated to your clients) that the Art Gallery, where such designs were hung, was required for the Spring Exhibition of Pictures, and no other suitable place was available.
- 3.—That the elevation and perspective of the premiated designs are not coloured as appears to be believed.

However aggrieved your clients may feel, there is not the slightest ground for suggesting that the adjudication on the submitted designs has been carried out in any way other than with the strictest impartiality, based on the committee's total ignorance of the authorship of any of the designs until after the premiums were awarded.—Yours faithfully,

(Sd.) FREDERICK STEVENS,  
Deputy Town Clerk.

## THE APPLICATION OF COLOUR TO INTERIOR ORNAMENT IN RELIEF.

THE Eleventh Ordinary General Meeting of the Royal Institute of British Architects was held last Monday evening, at 8 o'clock, Mr. H. L. Florence, vice-president, in the chair. The minutes were first confirmed, and the secretary announced the death of Mr. Edmond Egan, elected an associate in 1880. The chairman then called upon Mr. H. V. Lanchester and Mr. F. L. Jenkins, to read their papers on "The Application of Colour to Interior Ornament in Relief." Mr. Lanchester, having stated his indebtedness to Mr. H. C. Fehr, for his guidance in preparing this paper, said that the question of form and relief was so frequently of first importance that he should deal in his paper with the massing and treatment, both of colour and form, when applied to internal decoration. Modelled work as a basis for colour treatment gives a solidity and strength that enables the painting to be kept in a more delicate key than would otherwise be thought satisfactory. The relief also is helpful in connecting the work with the mouldings and forms around it in a way that no flat-painted work could do; and if the design of the whole interior is studied by architect and sculptor in conjunction, the result should be far beyond the very frequent method by which the architect leaves a space here labelled "Sculpture," or a panel there marked "Painting." The sculptor naturally asks for as much freedom as possible, while the tendency of the architect's idea is towards formality and symmetry.

### Spaces at disposal for decoration.

Of the spaces the architect usually puts at the disposal of the decorator, the frieze is the most interesting and offers the greatest variety in its requirements; it may consist of simple repetition of somewhat severely conventional forms, or it may teem with variety when it illustrates the great events connected with place or people. The frieze, however, is not always the most suitable form of decoration to adopt, and its comparatively uniform continuity of colour and modelling is not always what is most to be desired. A certain massing of either or both at intervals may, without cutting it up into disconnected panels, give the desirable suggestion of repetition to the frieze, and at the same time suggest a sense of support or connection between other portions of the whole design. This treatment suggests a greater degree of solidity and higher relief in the supporting or dividing portions, though the same end might be attained by giving them more severity of form. An uninterrupted frieze gives length to the surface on which it is placed by the horizontal, stratified effect so obtained, and the more the frieze is cut up into sections the less will the modification in proportion appear.

### Vaults and Ceilings

give exceptional opportunities to the sculptor, though he can rarely put into them work having the same human and personal interest that the vertical surface of the wall allows, as in most cases the decoration must be of a more structural and conventional character. With a view to suggesting the effects that can best be aimed at in various cases, the author went on to consider the actual methods of executing the work, and the most suitable colours and materials. The combination of

### Relief with Colour

is not only valuable where the figure forms the basis of the design, but can also deal in an interesting way with decoration based on landscape, architectural, and other forms, varying according to the subject and the dependence placed on the relief and on the colour. If the scheme of decoration is suitable, a delightful effect can be obtained by using colour very sparingly; as mere suggestion—in ceilings, for instance, where colouring

should always be delicate unless supported by very strong architectural forms. Interesting effects may be obtained where it is desired to embody existing pictures or sculpture in the decoration, such works giving a note as to treatment and colour.

### The Second Paper.

Mr. F. Lynn Jenkins, observing upon the present craze for lavishly decorated buildings, said that each new hotel, restaurant, or place of amusement has to vie with, and if possible, go one better in point of extravagant decoration than its predecessor, and the architect must often experience the greatest difficulty in complying with his client's demands, and sometimes at the expense of his own natural good judgment and taste. The necessity has arisen for a decorative material which shall, above all, be durable and easily cleaned, being permanently coloured to any key of brilliancy, and enriched with metals. These properties are embodied in the material known generally as coloured plaster relief work, and should prove almost sufficient reason for its production and use. With regard to the prevalent mode of decorating

### Rooms in Private Houses,

it is becoming more and more apparent how false a notion it is, and how extremely difficult to get any satisfactory effect by papering the walls and hanging pictures upon them. The revival of the old method of designing and making such decorations as are required as part and parcel of the scheme of the room is a movement the influence of which is found to be widespread by reason of its truth of principle, and also because even the unanalytical mind will grow to perceive its advantage without knowing why. The use of coloured relief for such purposes would often be found most serviceable. The author then described the material and method of its production, and the plan adopted in the working of

### Reliefs by Mr. Moira

and himself, working in collaboration. The relief work in question can in no respect be considered according to the usual laws governing bas-reliefs, but must be modelled strictly with a view to the reception of colour. The quality of the colour depends so much on the texture of the surface underneath that it requires not a little experience and many experiments to obtain good results. The peculiar properties of the material enable the painter to get a brilliant transparency of colour on some parts to contrast with the density of others, so that there are practically no limitations to handicap him. This plastic material has the additional merit of giving exact reproduction, even to the impression of a thumb-print in the finished cast. The panels are easily removable from the wall without damage to them. When the work is fixed complete in its position, it is carefully reconsidered with relation to its exact surroundings, and alterations can be easily effected if desired. Some special advantage is derived in coloured relief work by the collaboration of painter and sculptor. Each would exercise wholesome restraint on the other which would be beneficial to the work, while the joint imagination of two minds should instil a greater degree of interest.

### THE DISCUSSION.

The discussion was opened by Mr. J. M. Brydon, who proposed a hearty vote of thanks to Mr. Lanchester and Mr. Jenkins for their papers. He thought that the great difficulty architects had to contend with in interior decoration, as of rooms, &c., was the use of coloured decoration in relief. He thought there was now no difficulty in getting plenty of good work from artists. Mr. Jenkins had stated that it was practically impossible to get good work in coloured relief, unless two minds were engaged on it in collaboration. That was very well, as far as it went, but as architects were often asked only to suggest the colouring of sculptured decoration, this could not generally be done. When colour decoration was applied to sculpture there was a great risk of losing the delicacy of modelling. He

thought that all sculptured forms should be treated conventionally, not using naturalised forms. He thought in the examples exhibited in the room the whole treatment was a little too restless, the lines requiring more conventionalising. He added that a magnificent use could be made of gold, by reason of its restfulness. Colours should be reduced to a very few, whereby a broad, majestic, decorative effect would be obtained.

Mr. Harold Rathbone, being called upon, said that he wished to deal with the defiant attitude evidenced against a high glaze in decoration. He considered the great thing to attain was permanency, as by the use of glaze, although much might be lost by this high glaze. In the Della Robbia ware, made by the Della Robbia family in the past 400 years, the firing was not so hard as now obtained, but their work was very durable. As marble could not now be used, as was done in the Parthenon, owing to our smoky atmosphere outside, and as it was not quite suitable inside, he thought that the loss could be remedied by the putting of a light glaze over the work.

Mr. Mountford seconded the vote of thanks and agreed with Mr. Brydon, in the suggestion that a conventional treatment of coloured decoration in relief was desirable.

Mr. J. D. Crace was sorry to see that the technical method had occupied so much attention, for this after all was of second rate interest compared with the definite expression of surface and line.

The Chairman said he could not agree with the insertion of panels in the "spotty" treatment, and he thought that in the decoration under consideration an old tapestry effect should be sought after. He then put the vote of thanks, which was carried unanimously.

Mr. Lanchester briefly replied, and Mr. Jenkins, in acknowledging the vote, said that the material he and Mr. Moira worked in, as far as he could tell, was very durable, for they had tested it under water, and in very many ways. He held there were no limitations to the effects to be obtained, for any could be obtained.

The annual general meeting was announced to take place on May 1, when the annual report will be discussed, and the appointment of the Statutory Board of Examiners, nomination of Auditors, and appointment of Scrutineers for the annual elections, will take place.

**The Glasgow School of Art** architectural class held their annual Easter excursion to Oxford under the leadership of Mr. W. R. Watson and Mr. W. J. Anderson, and made the round of all the important colleges.

**A new High Altar** in Renaissance style has been erected in the "House of Prayer," Hagley Road, Birmingham. It is in alabaster coloured marble and metal, and has been designed by Mr. D. J. Powell and Mr. T. B. Hall.

**Knowle Church** is to be restored and the plans and specifications for new vestries and organ chamber have been completed by Mr. Chatwin, and Messrs. Collings and Godfrey, of Tewkesbury, have sent in a tender to do the work for £770.

**Mr. Robert Baillie**, who died at the residence of his son at Lordship Park, London, N., on April 1st, was the sole surviving partner of the firm of Westwood, Baillie and Co., ship builders and engineers, of London Yard, Poplar, E. Mr. Baillie, with the late Mr. Joseph Westwood and Mr. James Campbell, began in 1856 the business at London Yard, afterwards known as Westwood, Baillie and Co., and many bridges were constructed by the firm—notably, the Sukkur bridge for India, which was, till the completion of the Fourth Bridge, the largest cantilever bridge in the world, and the Attock and Chenab bridges. The firm also built Her Majesty's ships *Resistance* and *Valiant*, and other vessels. Mr. Baillie was a member of the Institution of Civil Engineers, the Institution of Mechanical Engineers, and the Society of Engineers, and an associate of the Institution of Naval Architects.

## THE ADVANTAGES OF BEING AN ARTIST.\*

BY BULKELEY CRESWELL.

WHEN I first considered the subject, the advantages of being an artist struck me as being so palpable, and so undeniable, that there appeared no doubt but there would be plenty to be said in amplification of them. It was recalled to my mind that a very large number of persons who are "artists" under no definition ever constructed, are yet wont to pose as such; and that a still larger proportion of those who actually are artists seem borne up by voluptuous self-sufficiency on the strength of the fact. Besides this, a talented friend of mine, who had built himself an enviable reputation as a palmist—a ladies' palmist—had informed me that he never fails to tell his subject she has "highly artistic proclivities, though he cannot say to what extent they may have been cultivated"; and that the subject never fails to go broad marvelling at the wonders of palmistry. None ever doubt that they are artists, he had assured me, even though they can only establish and corroborate it by recalling to mind a single performance on a basket chair with a pot of enamel paint. It is a delightful and dignifying revelation to them, just as it was to the countryman to learn for the first time of prose and verse. "Ere 'ef I," he said, "being talking prose all my life, and never knowed it!" From all this, I concluded, in my ignorance, that there must be some advantage in being an artist. It was soon forced upon me, however, that there were no advantages at all in being an artist, but that on the contrary the disadvantages were manifest and immense. In my simplicity it had never occurred to me that anyone ever did anything or assumed to be anything which did not bring in an equivalent advantage. Here then was an awakening. The practice of an art, it seemed, was not only shorn and barren of all advantages, but was literally a-crawl with disadvantages.

These disadvantages then reveal themselves as of two sorts or kinds. An artist not only incurs disadvantages himself, but has a number of extraneous ones also which are dissipated, as it were, and become disadvantages common to the community which has the ill fortune and the bad policy to harbour him.

To begin with, the most general and most essential quality of the artist, and one which is almost necessary in the higher flights of art, is that of having pains and crying out. An artist might almost be defined as "one who has had pains and cries out." Gentlemen, to have bad pains is not an advantage in spite of the atmosphere of romance that is popularly accorded to it. A man who has everlasting toothache in his soul, although he may foster and cherish it, is no sound man and he is no happy man. It is a disadvantage to have toothache in one's soul. As some of us inherit gout from forebears who lived too freely in the enjoyment of pleasures, so have these artists inherited a taint from the asceticism of mediæval days. But this is not exactly the point. What we are concerned with here is that the high sentiments of an artist are composed and fabricated of ignoble qualities. It is a disadvantage to a man to be loaded with ignoble qualities, even though they enable him to paint a fine picture, write a fine poem, or compose a great symphony. An artist's sensibilities are high strung to a morbid degree. Shades of colours, the contours of the human figure and of the misty hills, the silence of the night, the tumult of the sea, constantly move him to such fearful sensations as few healthy men know twice in a lifetime. His susceptibilities are like a help of jelly on a plate, which catches up the unperceived vibration of a cart passing in the street, and is ready to jump and shake itself to pieces on a quite ordinary commotion

near to hand. These unmanly, vapourish foibles the artist fosters, and cultivates, and prides himself in. He rejoices in a sort of fragileness of physique. He has, as I say, the inherent instinct of the ascetic. He is tyrannised over by his conscience and usually lacks all moral courage; no expediency, even in a matter concerning his daily bread, will urge him to break away from the principles and ideals of his art. He cherishes and boasts this fatuity as though it were a virtue, instead of being, as it is, a contemptible scion of that same moral cowardice which holds a man from doing what he thinks may be wrong. He is a poor creature hustled by his conscience, and his conscience is a thing he has himself built up out of paint pots, and hogs' hair, and the wretched cant of the studios or the literary club. He is an infernal Casabianca all in himself—he reduces lofty sentiments to a burlesque of them: he is for ever withstanding the natural appeals and claims of humanity and expediency till the voice of his artistic ideals shall cry him permission; he is, as I have said, another contemptible prig of a boy on another everlasting burning deck.

It does not seem desirable to pause longer on this unpleasant subject of the immoralities of the artist—we are none of us perfect. There is a great deal more to say, however, upon the matter of the fundamental selfishness latent in the artist, a selfishness which covers all he does and conceives of, and which explains to a great extent his motives as an artist. He is selfish, because the absorbing devotion of his life is directed upon his own inwards. Romney sent his wife from him permanently, because her companionship weakened his art. It is habitual for artists to neglect the claims of family and citizenship in the cause of this same Art. The artist believes he is making Art the absorbing devotion of his life, but in reality he is not, because what he calls "Art" is a code of conventions, abstractions, ideals, principles, what you will, that he has evolved out of his own personality, nourished by experiences which he has selected and sought out to the end of strengthening them; and he sits apart from the affairs, hopes, joys and sorrows of his fellow kind for fear of the hard facts which are apt to cancel and weaken his pretty conceptions of life. His attitude is exactly parallel with that of a certain epoch of philosophy, when, as I read in Carlyle, men consulted their own navels in the hope of reading in them the apocalypse of nature. The artist is in the same grotesque attitude; he is habitually focussed upon himself. He has drilled that tyrannic conscience of his into the view that this attitude is attributable to his soul. He has surrounded himself with his ideals, which are no more than highly coloured pictures of himself, till he is like a man in a room panelled with looking glasses; and because these reflected pictures naturally seem to him the consummation of all that is lovely out of heaven, he attributes the high elation he feels in their company, lifting him to the very stars, to his soul. Gentlemen, I hold this bandering of the word "soul," which has of late years come so much to be heard, in unequivocal loathing. Men do not paint pictures, model sculptures, write poems, romances, symphonies, with their souls. I am aware that Mr. Stopford Brooke has gone so far as to define Art as "that which sets free and purifies his soul." But we may excuse Mr. Brooke by supposing this to be a sort of rhetorical sneeze that has got into his page. What we cannot excuse, however, is the blatant unreserve—the graceless lack of sensibility with which it is become the custom to accord to the mystic and divine the phenomena resulting from the ordinary physical waxing and waning of our manhood. It is, we all know, nice to feel that our sentiments are sprung from a sort of rampant spirituality. It flatters; it confers a rarity, and a preciousness. It is true to say that we may now, with impunity, ascribe to soul the most of what our grandfathers attributed to stomach. This avowed intimacy with "soul" is one of the tokens of selfishness and egoism which constitutes one of the great disadvantages of being an artist; for as Mr. Kipling has observed, a healthy

man does not know he has a soul, and if we modify this by saying that a healthy man does not prattle of his soul we shall be well within the truth.

I have just used the word egoism. Well, gentlemen, it is surely this *egoism* that is the real keynote, the fundamental basis from which the sentiment of the artist is sprung. It is easy to explain the cause of this inherent egoism as it is to give illustrations and exemplifications of it. The artist instinct is born, exists, grows and reaches its full strength only by virtue of self concentration, and the elimination of outside antagonistic influences. This after a time constitutes egoism of a peculiarly malignant description. The "cliqueness" of artists is one instance of this self concentration and latent egoism. They herd together in little bands; they have no interest in anything but what bears upon their one infinitesimal corner of thought and deed in this wide world. They have no interest to know how their work is viewed by an outsider, or even by another practiser of another branch of the same art, because they know that his point of view differs and is apart from their own cherished convictions, and it jars the egoistic key in which they are strung to be reminded of it. A doctor who has long had a large general practice in the neighbourhood of St. John's Wood almost exclusively among painters, sculptors, musicians, and so forth, assures me that they are, as a whole, remarkable, not for ability, but for cultured ineptitude. He informs me that in one or two cases where the artist had found wide success, his genius was a form of idiocy. There are parallel cases, as we know; that of the calculating boy who could instinctively, in a moment, answer complicated mathematical questions that occupied accomplished mathematicians hours to solve. My friend tells me that the majority of these artists are incomplete and mentally unbalanced; they are not sound men; their religions are children's fairy tales; they could not take care of themselves if they wandered from their habitual circle of life; they are incompetent to form judgments on the simplest matters of every day life; and further, that they foster and cherish these limitations.

But, we need not go to doctors to learn these things, we may see them for ourselves. Most of us went to the last exhibition of the Arts and Crafts Society. What saw we there? We saw a few examples of sound, sensible and beautiful furniture and house dressings and decorations. What else did we see? We saw a conglomeration of mean vanities, advertisements, aggressive self sufficiency, and absorbing egoism, expressed in wood, metal, and fabrics. The show was chiefly remarkable for the evidence it afforded that so much pitiful human depravity could be expressed through wooden furniture. The recipe for a design seemed to be to conceive a wriggle in the abstract, as it were, and then fit a chair or table to it. Most of the exhibits expressed nothing but the desire of the exhibitor to do something individual and "clever," and not at all like what anyone else had ever done, and display his name against it. We surely never met with a more deplorable, unblushing admission of the contemptibility of human motives.

And to those who did not go to the Arts and Crafts there are plenty of instances forthcoming of the latent egoism dependent on the sentiment of being artistic. Such cases are paramount in our very midst. We may turn to the case of a well-known artist in a decorative line. He dresses in Elizabethan costume for dinner. This man is so imbued with the spirit of his Art that he cannot sit to eat in a room inspired from the traditions of the Elizabethan period, but in a costume of parallel date. The anachronism of nineteenth century dress, we are to understand, would take away his appetite. This is what he would hold a refinement of his artistic perceptions. Other people know, or ought to know, that it is a refinement of egoism, coupled with a complete lack of all sense of humour. Just picture this old fellow gravely coming down to dinner in a sword, and buckles, and ruffs, and his poor starved old shanks clothed in

\* Résumé of a paper read before the Birmingham Architectural Association on February 27th.

worsted tights and protruding from slashed trunks well stuffed with bran; for this, I believe, was the Elizabethan costume. Cannot we fancy him furtively tying his napkin about his knees to keep out the cold. I shall repeat, it is a disadvantage to be an artist.

Gentlemen, if it is a *personal* disadvantage to be swaddled in egoism, it is indeed a greater harm and disadvantage to the social community. It is only because we, as a nation, are prosperous and secure, that such creatures as these artists are endured; and did the instinct become general at all, if the doctrine of self-idealisation evolving "soul" were to become a religion of the country, the nation would *rot away*. The artist is an excrescence incidental to the luxurious securities afforded by civilisation. What good can we conceive of an artist in the event of a national calamity? If it came to any sort of practical doing or production he would fall far behind the most ill-developed factory hand. The artist is a rotten spot in the fair semblance of the community which has the ill-policy to tolerate and endure him. And he is vicious.

Let not that fact be blinked, gentlemen. He is vicious. Oh, his voice is inordinate and undisciplined. The practice of his art is a self-indulgence, and a self-indulgence that reduces his manhood and his utility, and weakens and enervates the social system of which he forms a unit.

These then are the main disadvantages, or rather the main bases of the disadvantages attaching to unrestrained indulgence in art, and it will be seen that an artist who falls away in any respect from these primal qualities that have been enumerated, falls away to an equivalent extent from those sentiments of high artisticness with which we are concerned. In so far as an artist falls away from these disadvantageous qualities essential to the artist, so does he fall away from the highest sentiments of art.

From this comes direct the inevitable conclusion: *That the advantages of being an artist, if any, rely on the absence of Art.*

But, gentlemen, I could hardly have dared to stand up before you this evening unless I had succeeded to some extent in explaining the apparent contradiction of the terms and solving the enigma expressed by them.

If then we take the chiefest bane of being an artist, namely, the refinements of egoism implied thereby, and replace it by its opposite term *altruism*, I think we shall find that matters will arrange themselves in a very plausible solution. This is the more satisfactory as we are probably all here agreed that altruism is the basis upon which art should rightly flourish. Well, and it does. Directly we see art based upon a sentiment of altruism the advantages of being an artist veritably teem.

The artist who is truly imbued with a sentiment of philanthropy or altruism will be first concerned, not with the perpetuation of his own personality and the conversation of his own vanities and ideals, but with the personality and the ideals of those whom he wishes to amuse or enlighten. He sacrifices his own ideals, he even jeers and scoffs at the works of art he labours to produce, so far is he removed from any personal vanity in the matter. The crowd of people for whose advantage he has cast his own feelings and principles to the wind, like and admire what he does, and that is all he needs. The more people he pleases the better he himself is satisfied, and his philanthropic disposition even counts its success when people admire, gape, or weep over creations that he has scorned to think of so soon as the work of completing them was out of hand. Now a cynical person would be ready to proclaim from experience of life that a man who labours in Art for the amusement and benefit of others, without a thought as to his own predilections, would be at a disadvantage, and receive scant thanks or rewards; and it is indeed a gratification to me to be able to show you that, so far from this being the truth, the opposite is the case. The advantages of Art when the artist works on altruistic principles, as has been already said, teem. First of all he gets money. People are willing

to pay highly for what pleases them; but this is not the only satisfaction accruing to our altruist: the fluctuations in his income keep him precisely posted in the waxing or waning condition of his popularity, so that when he finds that he is not pleasing people as much as he used formerly to do, he can at once mend matters by a change of ideals and artistic convictions before his discountenancing by the public swells so as to hurt his feelings with a sense of ingratitude. He also has the advantage of being talked about, and having his photograph published, with an account of what his wife looks like, and how he likes his eggs cooked at breakfast. Indeed, the advantages he enjoys can only be briefly suggested here: they continue as long as he continues to please, but he must be careful not to relapse into any self-indulgences in his work; he must not allow himself to ponder his art, nor to put thought or subtlety into it, or he will find his public falling away, for the public do not understand these things, and will say he is a "bad artist," which is a hard thing for a good philanthropist to hear. His safest and surest road to acquiring and maintaining success, is to keep his attention fixed on the advantages of his art, for it is only when he turns his art to advantage that he will enjoy the advantages of being an artist.

In closing, gentlemen, let me re-state the conclusions which have this evening been arrived at. They are as follows:

- (1) That the advantages of being an artist, if any, rely on the absence of Art, and
- (2) That it is only he who turns his art to advantage that will enjoy the advantages of being an artist.

## Keystones.

**St. George's Church, Leeds,** is to be restored at a cost of £5,000.

**A Stained-Glass Window** was unveiled at Camborne on Easter Monday.

**A Fire occurred** on the premises of Messrs. Carter, decorators, of Broad Street, Margate, last Thursday morning.

**Dagenham Beam Bridge, Essex,** is to be rebuilt at a cost of about £1400.

**Hughenden Manor Enlargements** will involve an expenditure of about £7000. A new wing is to be added.

**A new Theatre at Stratford** has been opened by the Mayor. It has been designed by Mr. G. W. R. Sprague.

**Statue of the Queen.**—The model for the Manchester statue of the Queen has been completed by Mr. Onslow Ford, the sculptor.

**A new Theatre of Varieties** has been erected at Hastings on the site of the old Marine Hotel. Messrs. E. Runby and Co. were the architects.

**The Seven Kings' Hotel, at Ilford,** is being reconstructed from designs prepared by Messrs. W. G. Bartlett and Son, architects, of 56, New Broad Street, London.

**The Institute of Builders.**—Mr. Joseph Randall (of Messrs. Kirk and Randall, Warren Lane Works, Woolwich) has been elected President of the above Institute for the ensuing year.

**The Foundation-Stone** of the new Free Church of Rothes was laid last Monday week. The church is being built from plans by Mr. Sutherland, architect, and is estimated to cost £2,200.

**New Window at Filleigh Church.**—A stained-glass window from the studios of Messrs. F. Drake and Sons, of The Close, Exeter, has been erected in the north transept of St. Paul's Church, Castle Hill, Filleigh.

**Designs for Ornamental Fountains** to be erected in four Manchester parks have been prepared by Mr. J. W. Beaumont, architect, of Manchester. The execution of the work will be entrusted to Messrs. Patterson, of Oxford Street, Manchester.

## ARCHITECTURAL ORNAMENT.

MR. T. DELGATY DUNN delivered a lecture to the students' section of the Dundee Institute of Architecture in the Technical Institute, at which Mr. Kennedy presided. The lecturer at the outset referred to the difficulty of defining exactly what was meant by ornament in architecture. After examining some of the more common theories, he said that for the purposes of his lecture he desired to include in the definition, in addition to the panels, foliage, or isolated ornaments, the varying and often subtle means whereby the architect gives an elegant, strong or reposeful character to his edifices. In illustration of this a comparison was made between the typical buildings of the Egyptians and Greeks. It was shown by lantern illustrations how the shape of the walls, towers and columns of the Egyptians suggested weight and mass, and how the ornament confirmed and intensified the suggestion. In contrast to this it was pointed out how the Greek ideal entirely differed in its architectural expression; and how every detail suggested the carrying power with ease and grace. The lecturer dwelt on the absurdity of using a delicate set of Greek mouldings, originally designed for white marble, to be seen in a pure atmosphere under a sunny sky, copied in dull grey sandstone exposed to a smoke-laden atmosphere under different climatic conditions. To expect such mouldings to be classic in feeling and effect indicated either a complete disregard of first principles or an equally complete ignorance of them. A part of the lecture was an analysis of the theory of light and shade, and the different effects produced by different stone dressing. It was shown that rough stone expressed stability better than smooth, because the nature of its chrysalisation was betrayed; while in stone which had been carefully tooled or rubbed down the natural grain was obliterated, and an artificial one substituted, resembling the grain of some other material, not stone, which was known to resist pressure indifferently. The effects of polishing, as in granite, were explained, and the manner in which artificial texture could be given to stone by different ornamental treatment, also the necessity for the ornament to keep step with the mechanical function of the various parts of a building. Following up this principle, the lecturer showed how carved ornament on structural parts could be made to accentuate the requirements of the structure. Regret was expressed that the object of using carved ornament, other than the purely æsthetic one, was not better understood by public Boards as well as by private clients, who would thus appreciate the reason why architects introduce carving. It was only fair to say, however, that architects did not always put the ornament in the places where its peculiar functions would be best and most economically illustrated. In conclusion, Mr. Dunn urged the expenditure of care in the choice of appropriate ornament, and the study of fitness and function in architecture. The adoption of a caprice was not to be justified by antiquity, nor was the hackneyed repetition of old and ill-understood forms the more commendable for the same reason. While the Corinthian capital might have been a very admirable one, there was no reason why it should be the stock piece of architects to all eternity. A thorough knowledge of the principles on which ornament was formed was necessary to all architects, not only to prevent the common error of introducing it without a reason, but to ensure its suitability where it was desirable to use it. The very permanence of architectural forms was the strongest argument in favour of the best being done.

**Discoveries at Rome.**—The bases of monumental lions which, according to the writer Vareus, stood on each side of the tomb of Romulus, have been found in the Forum at Rome, by Signor Boni, the engineer who has charge of the excavations. These bases are in tufa stone, and are very finely cut.

KENSINGTON PALACE. DRAWN BY C. G. HARPER.

## THE OLD KENSINGTON AND THE NEW.

BY CHARLES G. HARPER.

THE old-time distinction of Kensington has now nearly all vanished, and that "old court suburb" will presently be reduced to the condition of an ordinary London district. It was in 1851 that the market-garden and fields that now form the greater Kensington to the north and south and west, were first seriously threatened, and the great era of building activity inaugurated that gave us the delirious delights of Cromwell Road and Queen's Gate architecture. That was the day of Cubitt and Stucco, and the works of that period stand nowadays in their shamelessness, to teach us "how not to do it." That great building era has long since passed away, for lack of land whereon to build, but the parent parish of Kensington has for some time past felt the storm and stress of a newer era, which builds according to the circumstances arising from that lack of new building areas and the consequent enhanced price of old freeholds. For, with the lapse of time and the spread of business, the value of a square foot of land anywhere within the "four-mile radius" has gone up to a very great height, and it has become no longer remunerative to build houses of two or three stories only.

Thus it is that so-called "mansion flats" are springing up all over town in cloud-capped blocks that render the once-famed altitude of that pioneer among flats, the well-known "Queen Anne's Mansions," quite commonplace. And to this complexion has Kensington come at last. Time was, and that not so long since, when the vista down High Street, Kensington, looking eastward, was framed in and set about with the grateful greenery of Kensington Gardens. To-day the view is bounded by the near and odious neighbourhood of a towering pile of "flats," "mansions," "Babels"—what you will—that render nights hideous with their looming walls, and day desolate with a sense of prisoned life.

The newest change, however, in Kensington is that which will be wrought by the decision of the Queen to throw open Kensington Palace to the public, just in the way that Hampton Court Palace has long been the Londoner's resort. Until the present time Kensington Palace has been guarded by the police with a jealousy far more exacting than that exercised at Windsor or at St. James's Palace; places that, unlike Kensington, are not deserted by the Court. It has always been difficult to understand this really offensive

guardianship, since the old Palace has of late years been partly occupied only by junior branches of the Royal Family and by sundry pensioners. For years, indeed, the greater part of the building has been falling into decay, and the birthplace of Her Majesty had become the home of cobwebs. The prim pilastered red-brick front, built by William the Third, was sinking on its foundations, and the painted ceilings were even falling. During the last twelve months the Office of Works has been busily engaged in restoring the palace, previous to its being opened to the public as a show place, and large sums of money have been voted by Parliament for the purpose.

Another change at Kensington has just taken place, in the sale of the freehold, of the house, No. 16, Young Street. This is the curious double-fronted house, with semi-circular bays, in which Thackeray lived from 1847 to 1853. Here he wrote "Vanity Fair," "Esmond," "Pendennis," and a part of "The Newcomes." There were literary pilgrimages even during Thackeray's life, and his American publisher, Field, narrates how he visited, in company with that distinguished author, the different houses in which his books had been

DRAWN BY C. G. HARPER.

written. Thackeray struck a mock-heroic attitude before this house, exclaiming, "Down on your knees, you rogue, for here 'Vanity Fair' was penned; and, in truth, I have a very good opinion of that story myself!" The house was then numbered "13."

## THE MANUFACTURE OF BLACK PIGMENTS.

FROM the earliest days of the colour industry, charcoal and lampblack have held the very foremost place among black pigments. This is due not only to their moderate cost, but also to the absolute unchangeability of the free carbon, which resists chemical and atmospheric influences better than any other material. These carbon blacks have always been prepared by the imperfect combustion of bodies containing carbon and hydrogen in combination, such as wood, bones, oils, turpentine, &c. When these substances are burnt in such a way that only a limited quantity of air is permitted to have access to them, the hydrogen is consumed, thus forming water, while the carbon previously chemically combined with it is to a large extent left unoxidised, and therefore in the free state with its natural colour. Certain metallic compounds also, particularly those of iron, have long been employed in the manufacture of black pigments; these have also been obtained by the use of natural rocks containing compounds of iron, which are passed through grinders, and afterwards treated with acids and a tannic infusion, resulting in a sort of ink product, which is dried and used as other pigments are. The use of powdered coal and powdered carbonised lignite, as well as that of natural or artificial mixtures of carbon with earthy matters, dates back for nearly fifty years.

With regard to the methods employed for obtaining lampblack from purely organic sources, including the simple combustion of wood and bones, it may be stated that these are the oldest processes. Early in the present century lampblack was obtained by the burning of refined coal tar; this process was patented, and later it was proposed to carbonise coal tar with oil of vitriol, to achieve the same end. Black inks have been obtained by the precipitation of solutions of tannin, obtained from dye woods, myrobalans, &c., with artificial metallic salts. The aniline blacks for pigments, formed by the action of chloride of sulphur upon aniline, were introduced between thirty and forty years ago.

The most celebrated of all blacks, viz., Indian ink, is prepared from an extract obtained by means of evaporating to dryness a decoction of ginger, hoh-jang, kang-sang, and the pods of tchu-hia-tsao-ko, to which is added for thickening purposes, a size made from donkey skin and soot. This mixture is stirred into a homogeneous mass and allowed to harden in copper moulds.

W. N. B.

## Bricks and Mortar.

EFFINGHAM HOUSE, ARUNDEL STREET,

April 12th 1899.

"I know what it is to live in a cottage with a deal floor and roof, and a hearth of mica slate; and I know it to be in many respects healthier and happier than living between a Turkey carpet and a gilded ceiling, beside a steel grate and a polished fender. I do not say that such things have not their place and propriety; but I say this, emphatically, that the tenth part of the expense which is sacrificed in domestic vanities, if not absolutely and meaninglessly lost in domestic discomforts and incumbrances, would, if collectively offered and wisely employed, build a marble church for every town in England; such a church as it should be a joy and a blessing ever to pass near in our daily ways and walks, as it would bring the light into the eyes to see from afar, lifting its fair height above the purple crowd of humble roofs."—JOHN RUSKIN.

### A Municipal House Agency.

THOSE good people who view with dismay every fresh development of municipal enterprise, will not be pleased to learn that the vestry of St. Pancras have embarked in the business of house agents. But those who know the extreme urgency and difficulty of the housing problem in London, especially as it affects the working classes, will be disposed to welcome any expedient which tends, even in the slightest degree, towards its solution. Two registers have been opened, one for tenants in search of houses, and the other for landlords seeking tenants. No charge is made either against the landlord or the tenant, and the Public Health Department of the vestry has charged itself with guaranteeing that, as far as possible, only houses in a thorough sanitary condition will be entered upon the books. It was the displacement of so many people through the extension of the Midland Railway Company's premises, and the difficulty generally experienced by those displaced of finding suitable homes, that led the vestry to try this curious, but we think hopeful, experiment.

### The St. Paul's Decorations.

SOME of the daily papers continue to devote much space to correspondence on the decoration of St. Paul's. We have said before, and we say again, that with the tone and temper of some of the attacks made upon Sir W. B. Richmond, we have no sympathy whatever. Much of the criticism, however, is not of an offensive type, but arises from the natural and laudable desire of men of artistic sensibilities to preserve unimpaired a beautiful national monument, and to see that whatever decorative treatment it undergoes is in accordance with the intentions of its great designer. It seems unfortunate that no reply is offered by those responsible for the work. That Sir W. B. Richmond himself has not joined in the fray we do not complain; in his case, silence is undoubtedly the wisest and most dignified attitude. But the Dean and Chapter and the Decoration Committee might reasonably be expected to give the public some information, especially on these two points: First, what evidence have the trustees of the cathedral as to the wishes and intentions of Wren, which they profess to be carrying out? Second, what limit is to be placed upon the present decorative work? Will it stop short at the nave, or include the whole cathedral? The subscribers to the decorative fund, if no others, have surely a right to have these questions answered.

### London Boys and the Building Trades.

DR. WILLIAM GARNETT, the Secretary of the Technical Education Board of the London County Council, in presiding last Thursday at the annual conference of the National Association of Manual Training Teachers, referred to the report of the special Committee on the London Building Trades, which we notice at length

elsewhere. Dr. Garnett expressed very clearly the economic position when he said that if we let things take their course labour would be trained where rent was cheap, and consumed where rent was dear. That is a serious matter for London boys. As Dr. Garnett said, the sons of the London artisan had either to go in for an elementary commercial education, and become fourth-rate clerks, or start as errand boys and the like, and ultimately drift into the ranks of unskilled labourers. In the provinces the boys had greater facilities, and they came into London to take the places which London boys ought to fill. Dr. Garnett did not profess to be prepared with a solution of the difficulty, but he suggested that if they could extend the school age, and develop manual training classes and technical institutions, they might give their boys such a training in the use of tools and the application of geometry that, without actually making them bricklayers, joiners, or plasterers, they should be fit to take their place in a builder's yard and earn a living wage. Thus, he thought, might be overcome, to a great extent, the economic difficulty which now made employers of labour unwilling to take boys except on terms which were prohibitive to their parents.

### Blackburn's Gladstone Statue.

THE colossal statue of Mr. Gladstone, which is being designed by Mr. Adams-Acton for the Blackburn Corporation, was on view last week in the clay model at the artist's studio. The figure will be 11ft. high, and will stand on a pedestal of 10ft. The attitude represented will be characteristic of the late statesman. The statue is to be in Carrara marble, and it is hoped that it will be completed and in its place by next November. On the back of the pedestal will be inscribed a passage from Lord Salisbury's eulogium of Mr. Gladstone, delivered in the House of Lords. Mr. Herbert Gladstone, who recently visited Mr. Adams-Acton's studio, expressed himself delighted with the statue; he considered the likeness of his father to be one of the best he had ever seen.

### Report on the Art Students' Exhibition.

THE report which the examiners—Sir W. B. Richmond, R.A., and Mr. Selwyn Image—have presented to the Technical Education Board of the London County Council on the works of art presented for the recent exhibition and scholarship competition held by the Board, speaks favourably of the works submitted. The examples of bookbinding and metal work struck the examiners as being the best of the work inspected. In designing for tiles, wall papers, etc., they think the competitors have much to learn, and add:—"There is, for example, an exceedingly widespread predilection for what we can only characterise as the 'vermicular,' or 'squirmy' style of curvature in design, a style that is at once ugly, and a mere trick or artistic mannerism. It should be discouraged and stamped out as quickly as possible." On the whole, however, the work impressed them very favourably. The report concludes with a suggestion as to the kind of teachers required:—"The more there can be appointed for your schools teachers who are not only skilled workmen, but men of a fine artistic individuality, the more rapid and more thorough will be the advancement of your students. For it is undeniable that genuine art work, of whatever order, cannot be taught under mere rules and systems, but only by contact with a master working among his pupils, and advancing them by his personality and example. And the best work exhibited during this competition is the proof, plain and irresistible, of our statement."

### Catacombs at Moorfields.

AS was stated last week, the Roman Catholic Church of St. Mary's Moorfields, is to be demolished. The edifice is in the Italian style, and was built at a cost of about £26,000, from the designs of Mr. John Newman, in 1817. It comprises centre, north and south aisles, each of which terminates with a chapel. At the back of the high altar is

a screen of six marble fluted pillars of the Corinthian order, behind which is the fresco painting of the Crucifixion, which is the largest painting on the subject in England. It was the work of Signor Aglio, an Italian artist, but has been practically repainted by Henry Jacobs. In the sacristy there is a picture of the Sacred Heart, painted by Richard Doyle. In 1874 the church was threatened with destruction, owing to the extension of the Metropolitan Railway to Liverpool Street. In those days the building rested on wooden piles, which were so shaken by traffic, un contemplated by the architect, that a great deal of undermining and strengthening had to be done. It is not a very well-known fact that there are catacombs at St. Mary's, where hundreds of the "faithful departed" are buried; but such is the case. Some important personages are buried beneath the high altar; for instance, Bishops Poynter, Bramstone, and Gradwell. There is ample space for more, but modern authorities are not very favourable to burials in the heart of the City, although carried out in a way which would satisfy the most exacting of sanitary inspectors. When the church is demolished it is probable that every body will have to be removed, though where such a collection will ultimately rest is not yet decided.

### People's Palace Architectural Society.

A SOCIETY has been formed in connection with the Building Construction and Building Trade Classes at the East London Technical College, People's Palace, E. The membership is open to present and past students. The society's objects are the mutual advancement of its members through the reading and discussion of papers and visits to buildings and places of interest, and the promotion of social intercourse between students of the building classes. The preliminary meeting for the election of officers was held on February 25th. The first ordinary meeting was held on Saturday, March 25th, at 7.30 p.m., Mr. Francis R. Taylor in the chair. A short paper was read by Mr. Watson on "Bricks," in which the manufacture and properties of bricks were dealt with in a very interesting way. Mr. T. E. Kinch gave a short paper on "The Decay of Timber," and this contained some very useful notes on the subject. The first visit took place on Saturday last to Messrs Gibb's cement works, at Grays. The hon. secretaries of the new society are Messrs. F. Ferry and C. Weaver.

### The Antwerp Van Dyck Exhibition.

AN exhibition of the chief works by Van Dyck is to be held in Antwerp. The many pictures Van Dyck has painted in the course of his travels makes the collecting of his principal works for exhibition purposes a matter of considerable difficulty, although if the requests which King Leopold has addressed to Queen Victoria and the Emperor of Russia for the loan of the pictures in their possession are complied with, much will have been done towards overcoming the difficulty with which the organising committee of the exhibition has to contend. Three members of this committee recently visited England to take steps to secure as many of the works from the master's brush in the National Gallery and private collections as possible, but their negotiations are not yet concluded, so that it is impossible to say what pictures will be lent. A committee has been formed in London to further the aims of the exhibition in every possible way, and a similar committee is at work in Italy. The exhibition will probably comprise about 200 pictures, and negotiations are being made to insure this very valuable collection.

### The Alfred Memorial.

AT the annual meeting of the Hampshire Field Club and Archaeological Society, the Earl of Northbrook strongly condemned the proposal to erect a museum in the grounds of Wolvesey as a national memorial to King Alfred. Wolvesey, he said, should be preserved as an ecclesiastical place, as it is quite possible that it may again become the

residence of the Bishop of Winchester. He could not see that either Winchester or Hampshire would gain any particular advantage by having an archaeological museum at Wolvesey. He thought that, as Winchester was so near London, if a museum for Saxon antiquities was to be erected it ought to be in the metropolis, where it could be kept up with some prospect of success. In a letter to the "Times," Mr. Ronald S. Gower states that, in his opinion, Hyde Abbey, Winchester, is an appropriate place for erecting the memorial, which, he suggests, should take the form of a half-circle row of pillars, or a cloister, inside which should be a colossal cross inscribed to Alfred.

#### St. George's Church Spire, Liverpool.

ALTHOUGH the question of the disposal of the spire of St. George's Church, Liverpool, which is threatened with demolition, has been often discussed by those interested in its fate, the judgment of competent artistic or architectural authorities has not yet been obtained on the subject. The destruction of one of the most interesting of the civic landmarks of Liverpool, without first ascertaining the views of those qualified to give a verdict on the necessity of its removal, is certainly a great mistake. At their monthly meeting, on the 5th inst., the Liverpool City Council confirmed by 45 votes to 25 the general proceedings of the Finance Committee, who had, upon a report of the surveyor, decided to inform the Lord Bishop that they could not recommend that the tower and spire of the church should be retained, although an amendment for the referring back of the proceedings was ably proposed by Mr. W. E. Willink, and strongly supported by Sir William Forwood, Mr. J. Lister, who would have been glad to contribute £100 to making the tower substantial, Alderman Paull, Mr. M. H. Maxwell, Mr. M. C. Jones, and Alderman Garnett. As Mr. Willink pointed out the tower has stood since 1820 with no sign of weakness, and why it should be supposed that it cannot stand any longer cannot be conceived. He suggested that if it was absolutely necessary to remove the church to widen the thoroughfare which is at present only 44ft. wide, the tower should be allowed to remain. The protests made by two of the local architectural societies against its removal should have gone far to prevent such a thing happening.

**"Wireless" Telegraphy.** GREAT advances have lately been made with the so-called "wireless" telegraphy. As we announced last week, communication has been established between France and England, from stations situated at the South Foreland lighthouse, near Dover, and at the Chalet l'Artois, Wimereux, near Boulogne. The experiments have been most successful, for the various kinds of weather experienced—fog, high wind, and rain—have had no effect whatever. Professor J. A. Fleming, F.R.S., Mr. S. Flood Page, and Captain B. Baden-Powell have written to the "Times," expressing their appreciation of the great importance of Mr. Marconi's discoveries. The apparatus cost not more than £100 in all, and it has been found that the distance to which effective signalling is possible varies as the square of the height of the wire or rod attached to the receiving or sending apparatus; thus a wire 20ft. high carries the effective signal one mile, 40ft. high four miles, 80ft. sixteen miles, and so on. There would appear, therefore, to be practically no limit to the distance over which messages may be sent. The apparatus can be arranged to receive messages from a particular station or stations only,—a most important point. Mr. Marconi has placed a lightship on the Goodwins in instant communication, day and night, with the station at South Foreland, twelve miles away. This invention is not calculated to supercede the ordinary method entirely, but can, without doubt, save immense expense in the laying of submarine cables and should be of great use in signalling from ships to the shore, or from one to another. The French authorities are so gratified with the success of

the experiments that they propose, it is stated, to attempt to telegraph from Paris to the South Foreland, using the Eiffel Tower as their terminal.

#### Shelters for the Poor.

The Rev. James King, B.D., vicar of St. Mary's, Berwick-on-Tweed has sent us two pamphlets, one on "Ten Years' Work in Shelters for the Poor," and the other on "Fresh Light from the Holy Fields." These interesting pamphlets are published (price 6d.) on behalf of the Berwick Winter Shelters for Poor Lads, to which the profits realised will be given. Mr. King, who is a lecturer for the Palestine Exploration Fund, has for over twelve years performed excellent work in providing shelter for the deserving poor, and his pamphlet is the work of an authority on this subject. The excellent work performed by the Palestine Exploration Fund is not so fully known as it should be. Now that the subject has just lately been brought home to our readers by a lecture on "Ancient and Modern Buildings in Palestine," delivered by Mr. A. Beresford Pite, F.R.I.B.A., to the Architectural Association, and by a paper on "Some early Christian Churches in Palestine," read by Mr. A. C. Dickie, before the Royal Institute of British Architects, they should find plenty of interest in Mr. King's pamphlet, while helping to promote the solution of that great problem—the care of the poor.

#### Jerry-Building in Aberdeen.

WE reported in our issue last week a public meeting held in the Trades' Hall, Aberdeen, for the purpose of drawing attention to the prevalence of jerry-building in the town. If the promoters of the movement can obtain some improvement in this matter, a great service will have been done to the people of Aberdeen. But in any case it is a good thing that attention has been called to this important subject. Other towns may be aroused to deal with similar malpractices in their own locality. The Aberdeen "Daily Free Press" suggests that the Town Council might well consider the appointment of an inspector of buildings, on the model of the system in Edinburgh, where the powers regulating buildings are administered by the Dean of Guild Court, assisted by the ten members elected annually by the Magistrates and Council.

#### Insanitary Property in Liverpool.

AT the monthly meeting on the 5th inst., the Liverpool City Council had under consideration two reports of the medical officer of health with regard to premises that ought to be demolished. It appears that the Council are seeking the consent of the Local Government Board to borrow £50,000 for the purchase of this property, consisting of about 700 houses in Fontenoy Street, Scotland Road, and Toxteth Park. The death rate in the whole district to be dealt with was forty-three per thousand last year. The Insanitary Property Committee pulled down last year 471 houses in Liverpool, but only sixty-three houses under a rental of £12 a year were erected. In Vauxhall Ward during the past twelve years the death rate had been increased from 27 to 41 per thousand, for the poor people had been driven into property that was sanitary, and had rendered it insanitary. Some curious arguments were brought up at the Council meeting in support of the action of the Committee. One statement was that the landlords had in the past neglected their duty in the city. True, but what excuse was that for the committee and their inspectors? Another statement was that if the clergy would only induce the people to go and live further out of the city, they would do a great and good work. Things have come to a pretty pass in Liverpool, if the representatives of the people wish to excuse themselves by the delegation of their duties to the clergy. The Local Government Board would do well, before they sanction the expenditure of the money required, to obtain a definite scheme for the remedy of this most unsatisfactory state of affairs.

## Enquiries Answered.

The services of a large staff of experts, including all those engaged on "Specification," are at the disposal of readers who require information on architectural, constructional, or legal matters. Questions should in all cases be addressed to the Editor.

#### LECTURES BY WILLIAM MORRIS.

In reply to W.L.R. (Stroud) and others, the booklet "Art and the Beauty of the Earth," by William Morris, to which reference was made in our issue of March 22nd, is published by Longmans, Green and Co., 39, Paternoster Row, London, E.C.

#### FITTING UP OF COW HOUSES.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—May we ask through your valuable columns if you can recommend a book on the sanitation of Cow Ship-pens.—Yours truly, Tideswell. A. and H. H.

There is no book published dealing with this subject. The fitting of cowhouses, however, is fully treated in F. E. Colman's work on stable sanitation and construction, published by Messrs Spon. For the fitting of cow pens on cattle ships there are probably some Board of Trade regulations, but of this I am not certain. R. S. A.

#### BOOKS ON BRICK AND STONE WALLS.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—Can you give me some simple rule for determining the thickness at different heights for retaining walls of brick or stone; and is there any book which deals practically with the subject?—Yours, &c., Manchester. "PERPLEXED."

Rivington's "Building Construction," Vol. IV, price 15s. (Longmans, Green and Co.); and Middleton's "Stresses and Thrusts," price 5s. (Batsford), deal in a practical manner with the subject mentioned.

#### SYSTEMS OF LETTERING.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—Could you, through the medium of your Enquiry column, give me the price and publishers of any good book with the different styles of lettering, &c., for putting on plans.—Yours, &c. F. J. M. Sheffield.

"Alphabets, Old and New," by Lewes F. Day, price 3s. 6d., published by B. T. Batsford, 94, High Holborn, London, is the book that will probably best suit your purpose.

#### ESTATE DUTY.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—Could you inform me what is the percentage of allowance from the gross valuation of property for probate, and also for estate duty? Or could you give me the name of a book treating upon such allowances?

Yorkshire. L. J.

You would do well to procure a copy of the Finance Act of 1894, by which real and personal property were placed approximately on the same footing. By Section 7 (5) of that Act the principal value of any property for the purpose of probate shall be estimated to be the price which, in the opinion of the Commissioners of Inland Revenue, such property would fetch if sold in the open market at the time of the death of the deceased. Provided that, in the case of agricultural property, where no part of the principal value is due to the expectation of an increased income from such property, the principal value shall not exceed twenty-five times the annual value as assessed under Schedule A of the Income Tax Acts, after making such deductions as have not been allowed in that assessment and are allowed under the "Succession Duty Act, 1883," making a deduction for expenses of management not exceeding 5 per cent. of

the value so assessed. This principal value is very generally taken at from twenty to twenty-five years' purchase of nett rental value, or, if the property be "in hand," of the value at which assessed to Property Tax; and the deductions usually allowed (in either case) are land tax, fire insurance, and average annual repairs. It is practically impossible to state any "percentage of allowance," as every case must of necessity stand upon its own merits. —F. S. I.

### BOOKS ON PLUMBING AND ON PROFESSIONAL CHARGES.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—Can you tell me exactly the best book on domestic plumbing—kitchen boilers, &c.—and on heating in general? Is there any book on the subject of professional charges that would be of any use when beginning as an architect?—Yours truly,

Newcastle-on-Tyne.

B. B.

"The Plumber and Sanitary Houses," by S. Stevens Hellyer, price 12s. 6d., published by B. T. Batsford, 94, High Holborn, London, is one of the best books on domestic plumbing. For hot-water work, Hood's "Practical Treatise upon Warming Buildings by Hot-Water," rewritten by Frederick Dye, price 15s., can be recommended; a smaller and more elementary book that might suit your purpose, is "Hot Water Apparatus," by F. Dye, price 1s. 6d.; both these are published by E. and F. N. Spon, 125, Strand, London. "Specification," price 5s., contains a chapter on professional charges.

### JOINT DRAINAGE.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—I shall be glad if you will advise me through the Enquiries column on the following points with regard to joint drainage:—

A and B are owners of adjoining houses, A's being a corner house with stable at rear, the two houses and stable are drained through one drain (an old one) which runs across A's land into a sewer in the side street. This drain has become blocked. (1) If A clears the drain or by compulsion from the sanitary authorities makes any alteration in the joint drain, can he recover any portion of the expense from B, if so, what notice should be given by A to B and what is the course of procedure in the event of B refusing to bear any of the expense? B maintains the stoppage is caused by the drainage from stable. (2) Should the sanitary authorities require separate drainage, can B legally claim to lay his new drain across A's land or can A refuse and thus compel B to drain into sewer in main road? (3) Can the sanitary authorities require separate drainage for the stable, the house and stable being let to same tenant (stable by three years agreement and house weekly)? House is sublet by tenant.—Yours faithfully,

C. S.

Finsbury Park, N.

(1) The present drain where it carries from more than one house, through A's land, is a public sewer, repairable by the Local Authority, which cannot call upon A to do the necessary work nor upon either A or B to bear any of the cost. (2) The authority can stop the old drain (sewer) and insist on separate drainage, in which case B must make a separate connection without trespassing on A's land. (3) The authority can, and should, insist on separate drainage for house and stable, that is, if we read the question correctly that these are really quite distinct from one another though temporarily in the same tenancy.

G. A. T. M.

**A Memorial to the late Empress Frederick.**—A Chapelle Expiatoire is to be erected at Geneva. The Emperor of Austria will lay the foundation-stone on the anniversary of the late Empress's death. It will be a Gothic building, to hold 400 to 500 persons. The design will be a miniature of the Votiv-Kirche, in Vienna, lately described and illustrated in our columns.

## Professional Practice.

**Cardiff.**—At the annual meeting of the Cardiff Young Men's Christian Association, it was announced that a new building for the association was to be erected on a site adjoining Cory Hall, at a cost £15,000. The building will have a frontage of 70ft. and a depth of 100ft. Plans have been prepared for a five-storey building, to include a restaurant, a reading-room, a lecture hall to seat 350 people, a library, classrooms, baths, a gymnasium, and cycle stables. Space is also being reserved for fifteen bedrooms. The contract for the new building has been let to Messrs. Turner and Sons.

**Gosport.**—An isolation hospital, which has been erected from plans by Mr. B. E. Bolshaw, architect, of Southport, was recently opened at Gosport. The hospital stands in the centre of a field of two acres. There are three distinct buildings, the hospital itself being quite apart from the administrative and laundry blocks. Red local kiln bricks have been used in the construction, and the roof is covered with Major's patent Roman pattern tiles. Internally there are two distinct hospitals, each having an entrance of its own. Separate wards for men, women, and children are provided at both ends of the building, that at the western end for women being 36ft. in length by 22ft., while that for men is 24ft. by 16ft. The eastern end is of a precisely similar design, the exception being that the women's ward is 19ft. in width. Nurses' rooms are also provided, and a verandah 40ft. long by 10ft. surmounts the necessary offices. All the rooms are 13ft. in height, and the pitch pine floors are so laid that the nails are not visible. In the administrative block are a nurses' sitting-room on the first floor, a second storey with two large and three small bedrooms, and an attic floor above. In the laundry block are a bathroom, disinfecting apparatus, an ambulance and van house, and a mortuary.

**Montrose.**—A reredos has been erected to the memory of the Rev. Dr. Woodward in St. Mary's Episcopal Church, Montrose. It is about 15ft. wide by 12ft. high, and extends the full width of the triple-lancet window in the east gable. The base to the height of the super-altar is built in courses of Caen stone enriched with carved "paterae" and floral ornament. The super-altar is of Victoria red marble, and over it rises the central apartment of the reredos, which is the width of the altar, and is divided into three carved and deeply-recessed pointed arches, supported by columns of green marble with carved capitals above. The arches are moulded and carved, with crocketed gables above, the central one rising highest and being finished with a decorated cross. These three panels are divided and flanked by buttresses running up between the gables and surmounted by the figures of four angels. In front of the central panel, and on the super-altar, is placed the tabernacle, finished with crocketed gable and cross, and an oak door with brass mountings. On either side of the central portion of the reredos the flanking spaces recede somewhat, and are treated in a less ornamental manner than the centre—the panels being arched, with spandrels containing leaf ornament, resting on carved capitals and columns, and finished with a straight but carved cornice. The three central arches are filled in with gold mosaics and "Opus Sectile" work by Messrs. James Powell and Sons, of Whitefriars, London, the subjects representing in the centre the Blessed Virgin and Child, surrounded by adoring angels, with the shepherds and Magi in the side panels. The four side arches are fitted in with figures of the Four Evangelists standing out in relief on carved corbels, with the symbols. The material throughout is Caen stone, with the coloured marble shafts and mosaics referred to. The designs for the reredos were prepared by Messrs. Ross and Macbeth, of Inverness, and the work was done by Mr. Alexander Neilson, sculptor, of Dundee.

**Musselburgh.**—The Town Council has under consideration plans prepared by Mr. W. Constable, architect, for the reconstruction of the municipal buildings, offices, and town hall, at a cost of £3500, to which has to be added £350, the price of a plot of ground. The plans provide for a Town Hall to seat 1000, and having a floor space nearly three times the size of that of the present hall, a council chamber double the size of the present one, a police court and police accommodation.

**Newport, Fife.**—The students' section of the Dundee Institute of Architecture recently visited the Vickersford Cemetery, Newport, and inspected the Memorial Chapel erected there by Sir John Leng, M.P. Mr. T. Martin Cappon, F.R.I.B.A., President of the Institute, and architect for the chapel, met the students, and gave an interesting description of the building. Mr. Cappon pointed out that the plan of the chapel was very similar to the smaller chapels very often attached to cathedrals, more especially the French, and, while the general effect aimed at in the design was delicacy and refinement, care was taken in the selection of the building materials and in the construction to insure durability. The working of the Caen stone, jointing of mason work, oak roof, and other items, were described in detail. The style of the building throughout may be called Decorated Gothic, with a feeling of earlier work, much variety being introduced into the details of the leading features. The apsidal end of chapel is divided into five bays by massive buttresses, and between these are decorated windows, which, along with the other windows, all differ in design. The cloister is treated in three bays, divided by buttresses, and surmounted by crocketed gables, the work being connected with the main building by curved flying buttresses, which act as a support to the groined ceiling. The eaves are finished with an arcaded and weathered cornice, relieved at intervals by strongly marked gargoyles, while the whole is surmounted by a high-pitched roof and tapering fleche, all finished in oak and teak, covered with heavy lead dressed over rolls. The interior is finished in Caen stone, with vaulted ceiling. The side walls are divided into four bays by moulded responds, from which springs the vaulted ceiling. The floor is finished in mosaic. Much of the carving was executed by Mr. James Bremner, sculptor, and the whole building and details afforded scope for interesting sketches and photos. The lodge and gateway, with wrought-iron gates, of which Mr. Cappon was the architect, were also inspected.

**Perth.**—A new Congregational Church was opened last Saturday. It is built of red stone in Gothic style. The main entrance is from Kinnoull Street. On each side of the vestibule are stairs leading to the gallery, while on the left and right of the entrance are ladies' and gentlemen's cloakrooms. The interior of the building is about 51ft. long and 44ft. wide, with a slight incline upon the floor. There are circled seats at each side underneath the gallery. Immediately behind the pulpit is the organ. The pulpit is panelled and moulded, and lit by two standard lights. The gallery is of a horseshoe pattern, with passage running round each side. The building is lighted by four Gothic windows with tracery, and a large tracery window at the end of the church 15ft. wide. All the mouldings in connection with the ceiling are treated in ivory white. The building is seated for 650. The architects were Messrs. Steele and Balfour, of Glasgow.

**Sedburgh.**—Tinkle Street has been widened to six yards. At the north-east corner of the churchyard in this road a fountain and cattle drinking trough have been erected. The fountain, of yellow freestone, is Renaissance in style. There is a figured panel on the top representing the Saviour and the Woman of Samaria, which was modelled by George Finwith. The work was designed and carried out by Mr. John F. Curwen, of Kendal; Messrs. Pennington, of Kendal, being the contractors.

## Correspondence.

### "A PLAN OF LONDON."

To the Editor of THE BUILDERS' JOURNAL.

SIR,—In your issue of the 29th ult. (supplement), you mention the plan being made at the instance of the L.C.C., and say that "it aims at supplying a complete system of land registration," &c. I should like to hear the views of others as to whether there may not be some ulterior motive, not apparent on the face of the specious circular sent by the L.C.C. to owners of ground rents, for the purpose of this plan, and in which information respecting their property is requested. I have advised my clients not to supply any information until the object in view is clearly proved, in case it be a Progressive move for taxation purposes.—Yours, &c.,  
E. W. H.

## Views and Reviews.

### A CHART OF IMPROVEMENTS.

We have received a map of metropolitan railways, tramways, and miscellaneous improvements, deposited at the London County Council for the Session 1899. The map shows at a glance the railways in operation in or about London, railways sanctioned, railways proposed, tramways in operation, and tramways sanctioned. The plan of illustrating proposed improvements by means of a chart is a very good one, as it is so much easier to gain an accurate idea of the extent of intended alterations and additions from a diagrammatic representation of them than from a printed description.

A Map of Metropolitan Railways, Tramways, and Miscellaneous Improvements. Price, 3s. 6d. Published by George Philip and Son, 32, Fleet Street, London.

### PRICES FOR BUILDERS.

Lockwood's Builders' and Contractors' Price Book for 1899 is undoubtedly a very comprehensive work, and contains much information of value to the builder, architect, contractor, and engineer. The section dealing with electric lighting has been considerably improved. Not the least useful items in the book are the texts of the London Building Act, 1894, and the Amendment Act, 1898. A list of the district surveyors of the metropolis, with the boundaries of their districts, and the regulations made under the Metropolis Water Act, 1871, are also given. It is, of course, impossible to compile a universal price book, and the prices here given are based primarily upon those obtaining in London and the neighbourhood; contractors in the provinces, therefore, will need to make certain modifications. For London contractors especially, the work should prove invaluable.

"Lockwood's Builders' and Contractors' Price Book, for 1899." Price 4s. London: Crosby, Lockwood and Son.

### CHEMISTRY FOR PHOTO-GRAPHERS.

This book can hardly fail to be of practical value to the photographer who is not satisfied with simply a knowledge of how to develop his plates, and to tone and fix his prints. The first chapter contains some very useful hints on chemical cleanliness, and the several processes of developing, printing, &c., are dealt with in the following chapters. Many photographic formulæ are given, and not the least useful item in the book is a cyclopædic index, which gives the name of every chemical used, and the page on which it is mentioned, its synonym, symbolic formula, molecular weight, and solubility. If the author had said a little more about theoretical chemistry, the book would have been made more valuable to the advanced photographer without any loss to the beginner.

"Chemistry for Photographers." By C. F. Townsend. Second Edition. London: Dawbarn and Ward, Ltd. Price 1s.

### AN ELECTRICIAN'S POCKET BOOK.

This excellent little work supplies a large amount of useful information on the ordinary and commoner forms of electrical work, with which a practical electrician may be expected to come in daily contact. It also provides information likely to be required by those who have to attend to steam, gas, and oil engines, dynamos, and storage batteries, etc. The book contains a useful table of the principal electric supply companies of the United Kingdom, showing the normal price charged per unit. A special feature is the introduction of blank forms for particulars for estimating for work and materials, and also blank requisition and reminder forms, perforated to allow of their removal when filled up.

"The Practical Electrician's Pocket Book for 1899." Edited by H. T. Crewe, M.I.M.E. 1s. net. London: S. Rentell and Co.

### SOME ARTISTIC GIANTS.

The intention of the writer in producing this book is stated in the preface to be "to give in brief compass an insight into the essential characteristics of each of the masters treated, so that the traveller may be able to enjoy them for what they are, without looking for merits in one which can be found only in another." The masters treated are Raphael, Michelangelo, Leonardo da Vinci, Titian, Correggio, and Botticelli, and the author's principal aim has led him to lean rather too strongly on what he considers to be the distinctive qualities of each painter, and to sometimes manufacture rather forced descriptive phrases fitted to his conceptions.

The book commences with an introduction describing briefly and vividly the environment of the painters of the Renaissance, in which are a few statements which seem to be coloured by the theory set forth in it. Surely Simon de Montfort's crusade against the Albigenses was undertaken as against heretical doctrines, not because troubadours "sang too sweetly of woman's love and earthly beauty" (p. 2). And it is scarcely true that the Renaissance artists did not set abstract perfection before them as an end (p. 7). Raphael's and Michelangelo's works are proof of the opposite, as well as those of many of the later painters, as regards intention at all events. It was only the earlier painters whose "purpose was the expression of the individual countenance and form," of those, that is to say, who had not acquired full mastery of their craft. Below each master's name is the date of his birth and death, an excellent detail, as keeping before the reader's mind the overlapping of the lives of the artists treated.

With the commencement of the account of Raphael the author appears to fall into a dithyrambic exaltation, and looks at his subject through clouds of incense which rise from the altar which he had erected, etherealising and idealising him. For instance, the ascription of "perfect purity" to Raphael is scarcely born out by historical facts, and at the same time he is called a great decorator, and credited with the power of expressing space in a supreme degree, which is a disadvantage in decorative work.

While appreciating Michel Angelo very highly at the time he is dealing with him, the author appears to judge his power of composition almost entirely from the "Last Judgment," painted in his old age. It may be true that the compositions of the Sistine ceiling are "sometimes confused," but an attentive examination will show that those which thus fail were the first executed, the later ones being larger in scale, and harmonious and intelligible at the first glance; quite bearing out the author's words: "The grandest piece of decoration in the world is the Sistine's vault."

Another instance of his *parti pris* is the statement on p. 108, that "the Florentine rarely saw the perfect beauty of a sunset, but the Venetian lived in an ever changing pageant of colour." Those who have seen the sunset from S. Miniato or Bellosguardo, or even from the Ponte S. Trinita, when the hills of Carrara stand blue against the golden heavens, and the colour palpitates to the zenith,

enhanced by the contrast of the purples of the nearer hills, will feel that some other reason is required to explain the inferiority of Florentine to Venetian colour. And few people will be found to agree with the opinion that Titian's portraits are finer than those of Velasquez. Here, in England, we have pictures which prove the contrary, but a visit to the Gallery of the Prado at Madrid must convince anyone who has eyes to see that in that particular direction the best of the Italians are not his equals. In the notice of Correggio equality is claimed for him with the greatest painters, the author's enthusiasm evidently carrying him away. He says that Correggio "is no more open to the charge of immorality than the wanton flower that is kissed by the breeze;" that he is simply a child of Nature—a theory which the current story about the way he came by his death hardly bears out—that "the feelings which he expresses are joy and love, and if they are immoral, Heaven must be a place of exceeding wickedness"—to which one is inclined to reply that the Mohammedan heaven is the only one which can contain Correggio's "Antiope," as shown in the pictures in the Louvre. But, notwithstanding these blemishes, caused by too great enthusiasm for the subjects of the essays and consequent special pleading, the book is a good book on the whole for the persons whom the writer aims at interesting and instructing, and should help them to see that a picture may be something more than a pretty thing to glance carelessly over and then pass on, that the painter may have put part of his soul and his heart's blood into it, and that something of the history of the man and of his age may be divined by those who delve deeply enough.

Certain of the sentences well express artistic truths, an instance of which may be quoted from p. 28:—"In Art the decorative element is the universal, appealing to all times and to all nations; while the illustrative element is transitory, and when we lose interest in the events depicted, we lose interest in the work as an illustration; and then, if it still attracts, it must be solely on account of the decorative elements which it contains." This is very good, and it is a pity that the author's gift of rhetoric has sometimes led him to amplify rather than to condense what he has to say, thereby really weakening the effect which he would otherwise produce.

S. S. G.

"Renaissance Masters": The Art of Raphael, Michelangelo, Leonardo da Vinci, Titian, Correggio, and Botticelli. By George B. Rose. New York and London: G. B. Putnam's Sons. The Knickerbocker Press, 1898.

**A New South Pier for Lowestoft** is proposed to be run out opposite Claremont Road at an estimated cost of £25,000; its length will be 250 yards.

**A Marble Bust** of the late Rev. Dr. Moulton is to be executed by Mr. Adams-Aulton, and when finished will be placed in Wesley's Chapel, City Road, London.

**New Workhouse Infirmary for Norwich.**—At a meeting of the Norwich Board of Guardians it was proposed to erect a new workhouse infirmary at an estimated cost of £25,000.

**A new Workhouse Infirmary at Leicester** is proposed to be erected, owing, we understand, to the action of the Local Government Board, who will not assent to an extension of the present workhouse.

**Inglesham Church, Wilts**, is badly in need of restoration. It is about 700 years old. The Rev. O. Birchall, rector of Buscot, Lechdale, is appealing for funds to carry out the necessary renovations.

**Rebuilding Operations at the Pigeons Hotel**, Stratford, are being carried out under the supervision of Mr. Henry Poston, architect, of 39, Lombard Street, London; the cost of the work is estimated at about £13,000.

**Statues in Victoria Hall, Leeds**, of the late Sir Edward Baines and Mr. Robert Hall have been removed from a recess in which they have stood, to another part of the building, where they will be better seen by the public.

## WOOD-BLOCK PAVING.

(MR. WHITE'S SYSTEM.)

For Churches, Schools, Offices, &amp;c.

Estimates and full particulars on application to

THOS. GREGORY &amp; CO.,

WOOD PAVING AND STEAM

JOINERY WORKS,

Clapham Junction, S.W.

## "Side Pattern."

For side of Window Frame.

Use

"SIDE PATTERN" where possible.

Covered by 8 Patents.

(Other Patents Pending.)

These valuable Balances for SLIDING SASHES can be applied to OLD as well as NEW WORK. Require no Box Frames, and dispense with Weights, Cords, and Pulleys.

The NEW STYLE is Better, Cheaper, Neater, and more Durable than the OLD.

## COMING EVENTS.

## Wednesday, April 12.

EDINBURGH ARCHITECTURAL SOCIETY.—Mr. J. Fairweather, of the Glasgow Architectural Association, on "Minor Points in Practice." 8 p.m.

SOCIETY OF ARTS.—Ordinary Meeting at 8 p.m.

SANITARY INSTITUTE.—(Lectures and Demonstrations for Sanitary Officers.)—Inspection and Demonstration at Disinfecting Station, Lot's Road, Chelsea. Conducted by Dr. Louis Parkes. 3 p.m.

SANITARY INSTITUTE.—Miss Alice Ravenhill on "Practical Hygiene Teaching in Elementary Schools." 8 p.m.

LIVERPOOL ENGINEERING SOCIETY.—Mr. Malcolm Blair on "The Difficulties that Manufacturing Engineers have to Undergo in Estimating and Working to Civil Engineers' Specifications." 8 p.m.

## Thursday, April 13.

SOCIETY OF ARTS.—Mrs. Philip H. Newman on "Some Goldsmiths and their Works," with lime-light illustrations.

SANITARY INSTITUTE.—(Lectures and Demonstrations for Sanitary Officers.)—Inspection and Demonstration at Beddington Sewage Farm. Conducted by Mr. T. Walker. 3 p.m.

SANITARY INSTITUTE.—(Lectures and Demonstrations for Sanitary Officers.)—Mr. W. C. Tyndale on "House Drainage." 8 p.m.

INSTITUTION OF ELECTRICAL ENGINEERS.—"The Hissing of the Electric Arc," by Mrs. Aytton (conclusion of discussion). "Experiments on Alternate Current Arcs by Aid of Oscillographs," by Messrs. W. Duddell and E. W. Marchant (discussion, to be opened by the authors with an exhibition of experiments). 8 p.m.

SOCIETY ON ANTIQUARIES.—8.30 p.m.

## Friday, April 14

ARCHITECTURAL ASSOCIATION.—Mr. F. W. Pomeroy on "Modelling as Applied to Architecture," with practical demonstrations. 7.30 p.m.

ROYAL INSTITUTION.—Professor A. W. Rucker on "Earth Currents and Electric Traction." 9 p.m.

INSTITUTION OF JUNIOR ENGINEERS.—(Westminster Palace Hotel.)—Paper to be read and discussed: "Piles and Pile-driving," by Mr. W. H. C. Reid. 3 p.m.

GLASGOW AND WEST OF SCOTLAND TECHNICAL COLLEGE AND ARCHITECTURAL CRAFTSMAN'S SOCIETY.—Prize paper and criticism of papers by D. Mor.

## Saturday, April 15.

INSTITUTION OF JUNIOR ENGINEERS.—Visit to the works of the new Vauxhall Bridge. 3 p.m.

SANITARY INSTITUTE (Demonstrations for Sanitary Officers).—Inspection at Beddington Sewage Farm. 3 p.m.

PERTH ARCHITECTURAL ASSOCIATION.—Visit to Free Middle Church, Tay-street. 2.30 p.m.

## Monday, April 17.

VICTORIA INSTITUTE.—Meeting at 4.30 p.m.

SANITARY INSTITUTE.—(Lectures and Demonstrations for Sanitary Officers.)—Mr. G. Reid, on "Sanitary Appliances." 8 p.m.

SOCIETY OF ARTS.—(Cantor Lectures.)—Prof. H. R. Proctor, on "Leather Manufacture." Second lecture. 8 p.m.

## Tuesday, April 18.

SOCIETY OF ARTS.—(Applied Art Section.)—Meeting 8 p.m.

PERTH ARCHITECTURAL ASSOCIATION.—Visit to Free Middle Church, Tay Street. 2.30 p.m.

## Wednesday, April 19.

SANITARY INSTITUTE.—(Lectures and Demonstrations for Sanitary Officers.)—Inspection and demonstrations in the Parish of St. George's, Hanover Square, conducted by Mr. A. Taylor. 2 p.m.

SOCIETY OF ARTS.—Ordinary Meeting. 8 p.m.

## TENDERS.

BERWICK-UPON-TWEED.—For the erection of a police-station, Church-street for the Town Council. Mr. R. Burns Dick, architect, 55, Northumberland-street, Newcastle:—

# THE MANUFACTURE OF TERRA-COTTA.

## BALUSTERS AND BALUSTRADING.

By WILLIAM REID.

IN the article which appeared in Nos. 215 and 216 of the BUILDERS' JOURNAL the description given of how plain terra-cotta string coursing and mouldings were produced had, as then explained, only direct reference to the methods used in the manufacture of that particular type of work. When dealing with round objects, like balusters, different methods are employed. The illustrations of balusters and balustrading, Figs. 1 and 2, are intentionally made simple in design, and similar to those one may see every day. More elaborate work, covered with modelled enrichment, would again necessitate different treatment, and may be dealt with at another time. Of course it must be understood that a model, or pattern, of the object to be eventually turned into terra-cotta must first of all be made, and this model—for the term "pattern" is never applied to terra-cotta work—is almost invariably made of plaster of Paris.

To make the model for a round baluster, the template of zinc is cut as for string coursing, but, in this case, it is adjusted to a sort of lathe, as shown at Fig. 3. This lathe is a very simple contrivance, as will be seen from the drawing, and consists merely of two wooden upright ends fixed to a base, with a square spindle and crank laid over. The spindle is well oiled and a piece of paper wrapped round, then plaster is put on and the crank turned. By this means when sufficient plaster has been put round the spindle till it touches the zinc plate, a shape will be turned similar to that cut out of the zinc. When the top and bottom of the round balusters are square these must be made separately and fixed to the round portion afterwards. The purpose for which paper has been wound round the spindle is to prevent the plaster from sticking to it, and to facilitate the withdrawal of the spindle when the plaster model has been completed.

To make the mould the model is laid on the bench, as shown at Fig. 4, and built half-way up on either side with clay. The treatment of the ends in moulds of this kind requires special notice. If reference is made to the diagrams, Figs. 4 and 5, it will be seen that, at the larger end, the clay has not been placed round this part and, at the smaller end, it projects for about an inch, and, in addition, is carried up and round the whole end, leaving a margin of about an inch or so. This is clearly shown on the drawing, Fig. 5. The reason for leaving one end entirely uncovered is in order that the mould may be easily removed from the clay pressing. This will be better understood if one can imagine the mould filled with clay and set up on its end. Now, it is clear, if the mould were carried round this end and if set in an upright position, it would be an extremely troublesome matter to pull away the mould from underneath the clay, and the consequence is that the mould must be made in such a way as to enable the clay to rest directly on the floor when the mould is placed in this position. The smaller end of the baluster might have been entirely covered with plaster when making the model, but, if treated as shown at Fig. 5, the projecting part thus formed serves as a guide or gauge for regulating the thickness of the clay that is pressed round the inside of the mould, for the object is not made of solid clay, but hollow, which will not only make it lighter, but stronger and very much safer to fire.

Having, then, built up the plaster model as shown at Fig. 4, the exposed part is covered with plaster and neatly trimmed up. The model is then turned over so as to rest on the plaster, and spaces are cut out as shown at Fig. 6. When plaster is placed on the part that is now uppermost these square spaces form the joggles necessary to keep the two parts of the mould in their proper places. This type of mould is

called a "book mould." Each part is separately filled with clay, and the two pieces are then placed together. To ensure the clay in each half-mould sticking together, the adjoining surface of each piece is roughened, damped with a sponge and water, and a small roll of clay laid over, so that, when the two parts of the mould are laid over each other and well pressed together, the pressure will unite the one half with the other. After being left awhile to dry, the mould is taken off, and the baluster set on its end to become sufficiently stiff for the finisher to put the necessary finishing polish on it.

The coping, or plinth, may either be made in the same way as described for plain-string coursing—that is, from plaster moulds, or pressed through a die in a manner somewhat similar to that described for moulded bricks. A drawing (Fig. 7) is given of the front of the die used for producing a coping similar to that shown at Fig. 2. A back view (Fig. 8) is also given, showing the corners scooped out to

salts\* it may contain. It is afterwards thoroughly ground and mixed with water till reduced to a plastic and workable mass. Even then it may not be used immediately, but may be stacked in heaps, covered with damp cloths or matting and again left for some days, which will further tend to mellow it.

This prepared clay, then, is thrown into the stupid and converted into coping or tiles, &c., as explained. The strip of clay, on issuing from the die, is cut to convenient lengths, finished, and set aside to dry before being fired. To make the base or cap of the pillar shown at Fig. 2, the model is made by running a plaster moulding of the required pattern and mitring these pieces together. For the cap the moulding is made of plaster but the top part, being very simple, may be modelled out of clay. The whole is moulded in the same way as for string coursing, that is, the sides are first made and a case, or cover, is run partly over these to keep them together. A sketch of the complete mould for the cap is

TERRA-COTTA BALUSTERS. DRAWN BY WILLIAM REID.

allow the clay to enter the die more equally, and ensure an equal pressure at the mouth. An arrangement is also illustrated in this view, showing how heavy work is made hollow. A piece of wood is suspended in the centre of the die. It projects a little distance from the back, as will be seen in the drawing, so that the clay, when being forced through, may not be impeded by the iron framework necessary to support this wooden core. These dies are made of wood, and lined with moleskin. The principle of the machine used for this work is very similar to that explained in the previous article, the difference lying principally in the power used to press the clay through the die. The machine is not illustrated, as, if reference is made to the drawing of a pug, Fig. 2, in the wire-cut machine, it will be noticed that the screw adjustment of the knives forced the clay through the die. In the production of coping, &c., the clay is pressed out by means of a piston worked by steam power. Prepared clay is thrown into this machine—called a "stupid"—steam is turned on the piston and the mass is forced through the die.

It may be further mentioned here that, in terra-cotta work, more time and care is spent in the preparation of the clay than for bricks. The clay may have been left for some months to "weather," that is, it has been left exposed to the rain and frost after being dug from the clay bank. This seems to have the effect of greatly improving its quality besides helping to disintegrate it and wash out the insoluble

shown at Fig. 9. This drawing shows the mould resting on the case and filled with clay. Terra-cotta work is generally made hollow and, in heavy work of this sort, straps or stays are necessary to strengthen the work. These straps are shown in the illustration.

**Site of the Dundee Parish Council Offices.**—A site in West Bell Street, belonging to the town of Dundee, extending to 73ft., which has been selected on which to build new offices for the Dundee Parish Council, was exposed to feu, and the upset yearly feu duty was fixed at £60. This was offered by Mr. W. B. Dickie, solicitor, who was acting on behalf of Mr. W. Kidd, Stationer, of Whitehall Street, Dundee.

**Proposed Alteration at Alfreton Parish Church.**—At a social gathering of church people at Alfreton last week, the Vicar explained several proposals for structurally improving the parish church. It is proposed to lengthen the chancel, increase the height, and build an organ chamber on the south side of the chancel. Mr. Palmer-Morewood some time ago offered to add two bells to the belfry, so as to complete the octave. This will now form part of the general scheme, Mr. Palmer-Morewood defraying the cost, estimated at about £150. The total scheme will involve an outlay of £1100. The architect is Mr. Hodson Fowler, of Carlisle.

## WOODEN BEAMS.

By CHARLES W. TOMLINSON.

IN this article the method of working out the strength of wooden beams will be described.

The strength of a beam is (I.), Proportional to the breadth (II.), Proportional to the square of the depth (III.), Inversely proportional to the span.

Thus: If a beam of elm, 1" x 1" x 12", requires a central load of 650lbs. to break it, what load will be required to break a beam of the same timber, 4" broad x 10" deep and 20ft. long?

$$\frac{650 \times \frac{1}{4} \times \left(\frac{10}{1}\right)^2}{20} = 13,000\text{lb., or } 5.8 \text{ tons.}$$

This is, perhaps the simplest method, resting on proportion only. All that is needed to work out the strength of a beam in this way is to know the weight at which different materials, all, of course, of a similar size, will break.

Here is a list: Central breaking loads in lbs. for 1" x 1" x 12" beams—ash 650, beech 850, elm 650, English oak 550, white pine 450, yellow pine 500, pitch pine 550, teak 750.

These breaking loads differ slightly as laid down by the different authorities, but, on the whole, the results approximate fairly. The most popular formulæ for working out the strength of wooden beams are those of Hurst, as set out in the "Architectural Surveyor's Handbook."

The common formula for working out the strength of a loaded beam is  $W = C \frac{b d^2}{l}$

$W$ =breaking weight in cwts. in the centre.  
 $b$ =breadth in inches Values of  $C$ .  
 $d$ =depth in inches Ash ... 6.0  
 $l$ =span in feet Spruce fir ... 3.6  
 $C$ =a constant found by Greenheart 8.0  
 experiment (being  $W$  in English oak 5.0  
 cwts. required to fracture a Northern pine 4.0  
 1" x 1" x 12" beam) Teak ... 5.0

The method of using the formula will be best explained by a question.

What concentrated load will a 12' x 6" beam of Northern pine 15ft. long safely carry?

$$W = C \frac{b d^2}{l}; W = 4 \frac{6 \times (12)^2}{15}; W = \frac{4 \times 6 \times 144}{15}$$

$$W = \frac{1152}{5} = 230.4 \text{ cwts.}$$

But this is breaking weight, therefore taking 4 as a factor of safety, we get  $230.4 \div 4 = 57.6$  cwts.

This formula can just as easily be reversed in order to find out the required size of a beam. Example: What size should a beam of spruce fir be to carry safely a distributed load of 4 tons over a 12ft. span?

Now a distributed load of 4 tons = a concentrated load of 2 tons. And 4 as a factor of safety = 8 tons, or 160 cwts.; B. W. concentrated.

$$\text{Then } W = C \frac{b d^2}{l} \text{ or } 160 = 3.6 \frac{b d^2}{12}$$

One size must be assumed, let the breadth be taken at 5".

$$\text{Then } 160 = 3.6 \frac{5 d^2}{12}; 160 = 3 \times 5 \times d^2 = 1.5 d^2$$

$$\text{Then } 160 = 1.5 d^2, \text{ therefore } d^2 = \frac{160}{1.5} = 106.66;$$

$$\text{and } d = \sqrt{106.66} = 10.3 \text{ ins.}$$

An 11" x 5" beam would probably be used.

If, in assuming the breadth at 5", the answer had worked out to a very badly proportioned beam, say 16" x 5", another breadth would have had to be assumed and the problem worked out again in a similar manner, until a well-proportioned beam was obtained.

**Leicester Bricklayers' Labourers** have gone on strike to the number of 750 in consequence of a demand for an increase in wages from 6d. to 6½d. per hour having been refused. The stoppage of these men has brought out the bricklayers also, and about 1500 men are now idle.

## Masters and Men.

**Arbroath Joiners** are on strike for an increase of wages from 7½d. to 8d. per hour.

**Perth Painters** have obtained the increase of ½d. per hour for which they went on strike.

**The Stonemasons and Bricklayers of Neath** and district have struck because the masters will not grant them an increase on their wages.

**The Bricklayers and Labourers at Leicester** have struck work in consequence of the employers having failed to comply with the demand for an increase of wages.

**Ashton-under-Lyme Painters** recently demanded an increase of 1d. per hour, and on the matter being referred to arbitration, the arbitrator decided in favour of the increase. It is expected that the decision will lead to similar demands in other towns.

**Oldham Painters** were not satisfied with 8d. per hour, and struck for 8½d.; the masters have offered to make the increase from July 1st next. The men wanted the advance from April 1st, but it is expected that they will accept these terms, and so end the strike.

**Scarborough Labourers** in the employ of Mr. A. Moore, a building contractor, who are members of the Scarborough Builders and General Labourers' Union, have struck because Mr. Moore had employed a labourer who is not a member of the Union. At a meeting of the Scarborough Builders' Association it was agreed to support Mr. Moore by locking out all the members of the Union.

**Midland Ironworkers' Wages.**—A meeting of the Standing Committee of the Midland Iron and Steel Wages Board was held in Birmingham on March 31st, to receive the accountants' certificates. These showed that in January wages were advanced 2½ per cent., and since then a further increase has been made to keep level with wages in the North of England. On the latest certificate it was decided to add another 3d. per ton, making puddlers' pay 8s. 5d. per ton, against 8s. in January, and to raise other wages in proportion.

**Dispute in the Engineering Trade.**—A conference was held last Thursday between the representatives of the Engineers' Employers' Federation and the Amalgamated Society of Engineers at the Hotel Metropole, on an application made by the engineers of Mid-Lancashire, Halifax, and Newcastle for an increase of 2s. a week in their wages. The terms of the settlement decided upon at the conclusion of the engineers' great strike about fifteen months ago were that all cases of local disagreements between masters and men should be submitted to the executive committees of their respective organisations; therefore, the committees met on Thursday to discuss the first dispute of any importance that has arisen since the general strike, but no decision was arrived at, and the meeting was adjourned until the following day, when Mr. Biggart and Mr. Barnes, who respectively represented the masters and men, communicated to the Press the information that a recommendation had been jointly agreed on, which will be submitted to the parties concerned. The terms of the recommendation were not divulged.

**Halifax Joiners' Strike.**—Important Case.—In the Chancery Division, on March 29th, Mr. Justice Stirling had before him a motion by the plaintiffs in the action of Charnock and others v. Court and others. Mr. Upjohn, for the plaintiffs, said his clients were

Mr. Charnock, Mr. Earnshaw, and Mr. Sutcliffe, builders and contractors of Halifax, and members of the Master Joiners' Society of that town. The defendants were Mr. Court, the president, Mr. Sutcliffe, the secretary, and Mr. Rhodes, a committeeman of the Union of Workmen Joiners, and the object of the motion was to restrain the defendants from watching, besetting, or causing to be watched or beset, the landing stage at Fleetwood, or the railway station at Halifax, or the works of the plaintiffs respectively, or of any other member of their union, or the place of residence of any workman proposing to work for the plaintiffs or any other members of the masters' union, for the purpose of preventing them from working, &c., or for any purpose except to obtain or communicate information. The next branch of the injunction asked for related to a common law offence; and asked that defendants might be restrained from procuring persons who have entered into contracts with the plaintiffs or any other member of the masters' union to commit a breach of their contracts. The facts were that, owing to a strike of joiners at Halifax in January, the masters' union obtained two batches of non-union workmen from Belfast. On the morning of the 21st February nine men arrived at Halifax station from Fleetwood. Representatives of the masters were waiting to receive them, but workmen's representatives were also present, including Mr. Court. The masters did their best to look after the men, but were not successful, because Mr. Court induced seven of them to go away. Some went back to Belfast, and some to other places, and their expenses were paid. One man drew 7s. 6d. on account from Mr. Greenwood, to whom he was assigned, but was enticed away and did not return to work. Mr. Sutcliffe, the secretary of the men's union, went to Mr. Greenwood and asked for the man's tools, and when Mr. Greenwood told him of the draft on account, Mr. Sutcliffe at once repaid the 7s. 6d. It was admitted by the defendant, Mr. Court, that a man named Corrin said that he was bound for twelve months, and showed him the contract, so that when Mr. Court procured the man to break the agreements he did it with notice of this contract, and with his eyes open. Proceeding with the facts, Mr. Upjohn said that some two days later a batch of fifteen men arrived at Fleetwood on their way to Halifax. The men's union met them at Fleetwood. Consequently, out of the second batch eleven men were induced to break their contracts and not to go on to Halifax. There was a certain amount of conflict of evidence, but still it was clear that the defendants spent considerable sums of money in sending the men away. They admitted that, but said it was not the money of the union at Halifax. That, counsel said, might be explained thus. The men's union was a friendly society, whose funds were dedicated to certain purposes. They had, therefore, to make a "whip" for this money, but that could not be done without the consent of the union. There was no doubt as to the extent Mr. Court went, and that persuasion was used to induce the men to leave their employment. Mr. Jenkins, for the defendants, asked the Court to strike out that part of the writ which described the plaintiffs as suing on behalf of themselves, and all other members of the Masters' Union, on the ground that, this being an action of tort, the present form of the writ did not apply. Each of the three plaintiffs named might individually be entitled to claim, but there was no such common interest as to enable them to sue for themselves and all other members of the Union. Mr. Upjohn contended that the contract pledged the Masters' Union as a body, and, therefore, there was a common interest in the contracts. After some discussion his lordship directed the writ to be amended by striking out the words objected to by Mr. Jenkins, and, instead of those words, inserting the names of the remaining twenty-three members of the Masters' Union. Mr. Jenkins, on the merits, argued that there had not been watching or besetting within the meaning of the Act, and Mr. Upjohn having replied, his lordship said he would give judgment after the recess.

## THE PLASTERERS' DISPUTE.

A WELL-ATTENDED MEETING was held in Manchester on March 31st in support of the cause of the locked-out plasterers in Manchester and Salford. The meeting took place in the Free Trade Hall, and Mr. E. Grist, who presided, spoke in favour of co-operation among the men. Mr. John Harker moved a resolution condemning the action of the masters in locking out the plasterers at an hour's notice, in contravention of the agreement of June 15th, 1895. This was seconded by Mr. George Jackson, and unanimously carried.

A meeting was held in Nottingham on the 2nd inst. to consider the various aspects of the dispute, and the general expression of opinion was that the dispute must be maintained on the men's part unless a satisfactory conclusion should be arrived at at the forthcoming conference in London on the 6th inst. A meeting of all the branches of the building trades (except masons) was held on the 3rd inst. at Birmingham, and about 400,000 men were represented. The position was discussed from all standpoints, and a hope expressed that at the conference the dispute would be settled.

The long-desired conference between the masters and the men took place last Thursday, and lasted fully two hours. It was held at the offices of the Master Builders' Association in Bedford Street, Strand. The men's case was put by Mr. Deller, and the employers' case by Mr. Houldsworth, Mr. T. F. Rider, Mr. J. Bowen, and Mr. R. Neill.

A discussion took place with reference to certain objectionable practices set forth in the employers' manifesto. On the first point, the coercion of foremen, the men refused not only to abandon the practices, but withdrew an assurance given in their letter of March 24th, that they had no desire to coerce any one into joining their association. The portion of the men's letter referred to reads as follows:—"In reply to yours of the 18th inst., I have to inform you that we have not any desire, neither have we ever had any desire, to coerce anyone into our association; but we claim the right and privilege to persuade only any plasterer working at the trade to become a member."

The masters withdrew, and after consideration, they formulated the following questions, and submitted them to the men's representatives:—

- (1) Are you properly authorised definitely to agree to and sign any agreement we may arrive at with reference to the employers' circular of February last? Answer—Yes.
- (2) It must be understood that any agreement must be applicable to the whole of the country. Answer—Agreed.
- (3) Are you prepared to enter into a monetary guarantee on both sides for the faithful observance of any agreement arrived at? Answer—We cannot agree to a monetary guarantee.
- (4) In your letter of the 24th of March you state that you have no desire to coerce anyone into your association, and claim the right to persuade only. Do you confirm or withdraw that statement? Answer—We wish to be honest with you, therefore withdraw the words "persuade only" as we could not guarantee that our members would agree to such action on our part.

After further discussion, the employers said that it was the assurance in the plasterers' letter of March 24th that induced them to accede to the men's request for a conference, but as that assurance had been withdrawn, they declined to continue the conference.

It is reported that Mr. Deller said after the conclusion of the meeting, that the conference broke down simply because the Union refused to give a guarantee to coerce its members to work with non-unionist plasterers. The question put was whether it would be prepared to coerce its members to work with non-union men, and they refused because they could not bind any member to work with a non-union man if he was not willing.

The Lancashire master builders, according to an official report, are preparing for a general lock-out of their men to bring the plasterers' dispute to a settlement. In this action they are supported by the Engineering Employers' Federation.

The members of the Amalgamated Society of Engineers have agreed to levy themselves on behalf of the plasterers to the extent of twopence per week each member. By this over £700 per week will be collected.

## Builders' Notes.

**The Cookridge Street Baths, Leeds,** are to be reconstructed, and contracts have been let for £5,635.

**The Nottingham Builders' Labourers' Union** celebrated their eighth anniversary on Wednesday last by a dinner.

**A Building Stone and Brick Exhibition.**—Our contemporary, "The Quarry and Builders' Merchant," has made arrangements to hold an exhibition of building stone and brick, in connection with "The Surveyor" exhibition of road-making methods and appliances, at the Building Trades' Exhibition, which will be held at the Royal Agricultural Hall, from April 26th to May 6th. A collection of all the principal varieties of building stone and brick will thus be presented in a single exhibit, and opportunity will be afforded for quarryowners and brickmakers to bring into the market many little known varieties of the materials. The exhibits are confined to small specimens of the products of the various quarries and brick works, each specimen to be marked with the name of the producer and the description of the stone. The specimens will afterwards form a part of the permanent museum of building stone and brick, kept at the offices of "The Quarry and Builders' Merchant," which is open to the inspection of architects, engineers, contractors, &c. Particulars can be obtained on application to 5, Arundel Street, Strand, W.C.

**Colchester New Town Hall.**—At a meeting of the Colchester Town Council last Wednesday a letter was read from the architect of the new Town Hall, Mr. John Belcher, with reference to the Tower, stating that, though he could not recommend any alteration in the size or general design, he found that by the use of the "Owen Artificial Stone" in its construction, the total cost would be £2,562 6s. 10d., instead of £4,070, if Portland stone were used, and that the contractors were agreeable to carrying out the work for the first mentioned sum. The Deputy Mayor (Alderman Paxman) had offered to increase the amount of his gift from £2,000 to £2,500, and the New Town Hall Committee expressed their appreciation of his liberality. The architect had been asked whether he had made the fullest possible inquiry as to the suitability and durability of the Owen stone, and replied that he felt he could recommend the stone with some confidence, as it had been well spoken of by masons and builders who had worked it. The Owen Stone Company had also written, stating that the stone could be used without any fear of its giving way from any action of the atmosphere, or frost or heat, and the Company would guarantee to replace the stone if at any time within ten years of its fixing it suffered from any deterioration of the atmosphere. Further consideration of the matter was deferred until the return of the Deputy Mayor.

**A Drainage Case.**—At Clerkenwell County Court, before his Honour, Judge Edge, Thomas Wm. Kingsland, builder, of Beechholme Road, High Road, Clapton, sued Maurice Miroy, agent, of Anson Road, Tufnell Park, for £52 5s., for work done and materials provided; and there was a counter-claim for £50 damages alleged in respect of the plaintiff's negligent

and defective execution of drainage work—viz., his omission to provide for the drainage of the cellars and basement at "Ellengowan," 40, Anson Road, Tufnell Park, and failure to lay drain pipes to the depth shown on the plan prepared by the plaintiff, approved by the defendant, and lodged with and passed by the Islington Vestry. It was stated that Mr. Miroy received notice from the Islington Vestry, specifying certain nuisances upon his premises which required remedying. The matter was put in the hands of Mr. Kingsland, who carried out a system of drainage. Previously, for no less than nine years, the cellars had been perfectly dry; and it was submitted, on behalf of the defendant, that, after the execution of the work, the cellars were flooded after a downfall of rain to such an extent that it took two men six hours each to bale the water out. Further, it was said, an outlay of £50 would be required to put the cellar right again. The jury retired at the close of the evidence, and found a verdict on the counter-claim for £52 10s., the plaintiff's claim being allowed by consent.

## Engineering Notes.

**Pontefract Workhouse** is to be lighted by means of electricity.

**The Leeds Gas Committee** propose to spend £111,680 on extending gas mains in the city during the next five years.

**The Tramways in Glasgow** are to be in large part converted from working by horse traction to electric traction at a cost of £102,000.

**Halifax Electric Tramways** have just been extended by the opening of a new section. Since the inauguration of overhead electric tramways in the town nine months ago, the receipts have amounted to about £10,500, and the profits to nearly £2000.

**The Church of the Virgin Mary, Elvetham,** has been fitted with the latest improved small tube hot water heating apparatus and tubular exhaust ventilators by John King Limited, engineers, Liverpool, employing their well-known special economical coil heater.

**Newcastle City Engineer and Overhead Tramways.**—Mr. W. G. Law, Newcastle City Engineer, in a report to the Tramways Committee, combats the overhead trolley system, and states that to establish it in Newcastle would be "an outrage that would rival the destructive efforts of the Goths and Vandals."

**Electricity at Grimsby.**—The Grimsby Town Council applied to the Local Government Board recently for permission to borrow £43,500 for electric lighting purposes. In response to the application, Mr. Ducat, Local Government Board Inspector, held an inquiry into the matter last Thursday, and the scheme was not opposed.

**Blackburn Electric Tramways** were opened by the Mayor on Wednesday last. The Corporation has purchased the whole of the tramways working in Blackburn, but so far only four miles have been electrically equipped. The tramways were expected to be opened last July, but great delay was caused by the engineering strike.

**Ventilators for an Asylum.**—Additions are now being made to Larbert Imbecile Institution (Messrs. A. and W. Black, of Falkirk, Architects), and special attention is being given to the ventilation, which is being carried out by means of "Cousland's Improved Climax" Patent Direct-acting Invisible Roof Ventilators, supplied by the "Climax" Ventilating and Heating Co. Limited, of Glasgow.

**New Railway Engine.**—The Lancashire and Yorkshire Railway Company have constructed at their Horwich Locomotive Works a ten-wheeled bogie engine for express traffic, which is believed to represent the extreme limit of dimension practicable on an English railway. The new engine weighs 58 tons 15cwt., its tender 30 tons 13cwt. 1qr., making the total weight 89 tons 8cwt. 1qr. There is coal space for five tons. The boiler pressure is 175lb. to the square inch, and the size of the boiler is quite abnormal.

**The Extension of the Oldham Electricity Works** was considered at a meeting of the Corporation, and plans and estimates, which have been prepared by Professor Kennedy, were discussed. The plans provide for an extension of the boiler-house and addition to the boiler power to meet the increasing demands for energy. The present boiler power is not equal to the engine power. Professor Kennedy also recommended the alteration of the whole of the mains to the three-wires system, and the extension of the mains into other districts. The total cost of the alteration and additions is estimated, for the purposes of the application to the Local Government Board, at £17,800, exclusive of alterations and extensions which are necessary to the lodge.

**The Montreal, Ottawa, and Georgian Bay Canal**, connecting Montreal with Georgian Bay, will probably be opened within three years. This new waterway will shorten the journey from Duluth, the great grain centre of the North-West, to the sea by 375 miles. New lines of grain steamers and canal boats will be put in commission as soon as the Canal is ready for traffic, and fear is entertained in New York that these vessels will divert the greater part of the Duluth grain shipments. The new route will be through Lakes Superior and Huron to Georgian Bay, and thence through the Canal. At present there are two waterways from Duluth to the sea. One is through Lakes Superior, Huron, Erie, and Ontario, and down the St. Lawrence, and the other is via the Erie Canal, from Lake Erie to Albany, and then down the Hudson River to New York.

**Aberdeen Electric Tramway.**—An offer made by Messrs. J. M'Adam and Co., of Aberdeen, to the Tramways Committee of the Town Council to do the permanent way and road work for £19,000 has been accepted. For the overhead line construction, feeder, pilot, and test cables, tramway cars and accessories, switchboard, instruments, &c., numerous offers have been received by the committee from firms in this country and in America and Germany. It was remitted to a sub-committee to finally select offers from the following list of firms: Messrs. Blackman and Co., London; Messrs. British, Thomson, Houston, and Co.,

London; Messrs. M'Cartney, M'Ilroy, and Co., London and America; and the Westinghouse Co., London. It is expected that the total cost of the work, which will likely be completed in four months, will be £35,000.

**Proposed Harbour at Portessie.**—At a meeting of the Portessie Harbour Committee a plan of the proposed harbour was submitted by Mr. Alexander Melville, C.E., of Aberdeen. The site is at the east end of Portessie, extending within six feet of the ditch. The east pier projects 369ft. north-west, and the west pier, which starts about 800ft. further west, forms an arm 730ft. long, with a jetty 84ft. long extending inwards from it, making the harbour entrance between jetty and east pier 75ft. wide. The harbour area is six acres. The estimated cost is £13,300. The plan also contained an alternative scheme extending 60ft. further seaward, giving 4ft. more depth, at an estimated cost of £17,500. The committee expressed themselves pleased with the plans submitted, but deferred decision for a week.

**English orders for America.**—The Directors of the Barry Dock and Railway Company have decided to accept the tenders of an American firm for the supply of several locomotives for their mineral and passenger train services, and to accept tenders for the supply of three locomotives of Belgian manufacture. The Directors assert that in addition to getting quicker delivery, the cost is about £500 less on each locomotive than they would have to pay in England, while the workmanship is quite as good, if not better. By way of elucidating the difference between the cost of American and English engineering work, it is stated that the American workmen put in 3100 hours on a given job, compared with 1900 by the English workmen, whose labour is limited by the rules of his Union. Mr. George Barnes, when interviewed on the subject, ridiculed the statement that the difference in the cost of the work between American and English firms was due to the longer hours worked by the American engineers. The statement that the American workmen put in 3100 hours to the Englishman's 1900 hours was, he said, absurd on the face of it. The American worked an average of fifty-eight hours per week and the Englishman fifty-three hours or fifty-four hours. But it did not necessarily follow that the longer hours worked affected the price. In fact the hours worked did not make the slightest difference to the price. The Editor of "Fairplay," Mr. T. H. Robinson, in a letter to the "Times," thinks that the real cause of the trouble is the restriction of apprentices imposed by trade unions. He says: "The object of trade union is not to increase trade, but to limit the number of men employed in any particular industry, and this object they have attained with the result we see."

# Surveying and Sanitary Notes.

**Grimsby Street Improvements.**—An inquiry was held at Grimsby last Thursday by Mr. Ducat, Local Government Board Inspector, into an application made by the Grimsby Town Council for sanction to borrow £1,038 for the formation of a new street to connect Guildford Street and Hilda Street. It is proposed to remove three houses in Guildford Street, so that Cope Street may be connected with Tunnard Street, which will allow access to Victor Street from Hilda Street. The scheme was not opposed.

**Street Improvements at Hawick.**—At a meeting of the heritors of Wilton Parish, held last week, it was resolved to contribute a sum of £60 towards widening the main thoroughfare at Wilton Place on condition that the Town Council carry out the whole work. The proposal is to widen the street there by adding to the roadway two feet of Wilton old churchyard, where no interments have taken place, and if the objections of two heritors can be overcome by some arrangement, thirteen feet will be taken in, and Wilton Place put in a line with Princes Street.

**Nottingham Improvements.**—Mr. R. H. Bicknell, M. Inst. C.E., held an inquiry at the Guildhall, Nottingham, last week, on behalf of the Local Government Board, into the application made by the City Council to dispose of corporate land situated on the north side of Derby Road, by way of building leases. Mr. J. H. Richards, who represented the Council, having proved the formal notices, explained that the property comprised a number of small shops fronting Derby Road, and some small cottage property and workshops at the rear. The shops were very old, and altogether unsuitable for one of the main thoroughfares leading to the Great Market Place. The cottages at the rear were also very old, and in an unsatisfactory state. It would be impossible to put the property in a good state of repair without the expenditure of a large sum of money, amounting practically to reconstruction, and the Corporation were of opinion that the property should be cleared away, and the land put to better use. The Corporation do not propose themselves to undertake the erection of new buildings, but to offer the land by public auction on leases, subject to such conditions as would insure the erection of more modern buildings suitable to the requirements of the neighbourhood. The area of land involved is 1296 square yards, and it was estimated that the annual ground rent to be derived from the land would exceed the present net rentals.

## Property and Land Sales.

To Builders, Contractors, and others.

**MESSESS. FULLER, HORSEY, SONS, AND CASSELL** are instructed to SELL by AUCTION, in lots, at South Wharf, Lowestoft, on TUESDAY, APRIL 18th at half-past 12 precisely,

**SAW-MILL PLANT and MACHINERY,**

including vertical timber frame, two double deal frames, two circular saw benches, two moulding machines, panel planer, two general joiners, trying-up machine, two fret saw machines, tenoning machine, Richard's patent mortising and boring machine, 6 foot-power mortising machines, dovetailing, tree-nail, sand-papering, and painting machines, wood-turning lathe, two mitre cutters, moulding-iron grinder, water of Ayr stone, eight glue-heating stoves, 118 joiners' benches, frame and circular saws, cutters, chisels, carpenters' and joiners' tools, planing machine, drilling machine, two lathes, engineers' and smiths' tools, two Cornish boilers, 30 h.p. condensing beam engine, 20 h.p. horizontal condensing engine, table engine, shafting and gearing, leather bands; also

**The BUILDING MATERIALS**

of the Saw Mills and other buildings, comprising about two tons lead on roofs, 250 squares slates, 150 squares tiles, 250 squares slate boarding, 600 squares flooring, 600 squares rough and weather boarding, about 100 loads timber in roofs, girders and uprights, sashes and doors, 60 rods brickwork, quantity bricks, tiles, stone, drain pipes, old lead and non and builders' materials, water-cart, three tumbril and spring carts, nine trollies and wagons, two timber whips, and other effects.

May be viewed the day preceding sale, and catalogues had on the premises; and of Messrs. FULLER, HORSEY, SONS, and CASSELL, 11, Billiter-square, London, E.C.

Auctions for the Year 1899.

**MESSESS. TROLLOPE'S SALES of FREE-HOLD and LEASEHOLD ESTATES, HOUSES, GROUND-RENTS, &c.,** will take place at the Mart, E.C., as follows:—

Thursday, April 20th	Thursday, August 3rd
Thursday, May 13th	Thursday, October 19th
Thursday, June 8th	Thursday, November 23th
Thursday, July 13th	Thursday, December 14th

Sales will be held on other dates as required. In all cases Messrs. Trollope will be glad to have as long notice as possible respecting any property they may be instructed to offer by auction.

Forthcoming Sales for the Year 1899.

**MESSESS. E. and H. LUMLEY (Lumleys,** of St. James's House, 22, St. James's-street, London, S.W.) beg to announce the following days of SALE by AUCTION, for the forthcoming year, at the Mart, Tokenhouse-yard, E.C.; but, in addition, other dates can be arranged for special sales. Terms on application.

Tuesday, April 25th	Tuesday, Aug. 15th
Tuesday, May 23rd	Tuesday, Sept. 12th
Tuesday, June 6th	Tuesday, Oct. 17th
Tuesday, June 20th	Tuesday, Nov. 14th
Tuesday, July 4th	Tuesday, Nov. 28th
Tuesday, July 18th	Tuesday, Dec. 12th

Messrs. E. and H. Lumley announce in the advertisement columns of the "The Times" on Saturdays a complete list of their sales, which will include estates in England, Ireland, and Scotland, town and country properties, ground-rents, reversions, gas and water shares, stocks, &c. In cases where property is to be included ample notice should be given in order to insure due publicity.—St. James's-house, No. 22, St. James's-street, S.W.

By **EDWIN FOX and BOUSFIELD,**

At the Auction Mart,  
On Wednesday, May 10th,  
At Two o'clock, in one Lot.

**MILL-HILL, Hendon.**—Valuable FREE-HOLD ESTATE, well situate, opposite the Mill-hill Station, on the Great Northern Railway, with its capital service of trains to King's-cross, Moorgate-street, and Broad-street, and within eight miles by road of Regent-street. The property comprises nearly 100 acres of ornamentally timbered pasture land, with a gentle, warm southern slope, almost entirely surrounded by parish roads, to which there is about a mile and a half of existing frontage, and great scope for creating other leading thoroughfares. There is a substantial house known as Bitcay Farm, with a capital range of outbuildings. The estate in its present form commands a rental of £300 a year, and is capable of development by judicious building operations, or the creation of freehold ground-rents. The land is exceedingly well circumstanced for the formation of through roads, and the creation of new frontages in addition to those it already possesses.

Particulars at the Mart; at Messrs. EDWIN FOX and BOUSFIELD'S Office, 99, Gresham-street, Bank, E.C.; and of the

Vendors' Solicitors, Messrs.  
**SOAMES and THOMPSON,**  
12, Coleman-street, E.C.

**SANITARY INSPECTORS' EXAMINATIONS.**—An Associate of the Sanitary Institute thoroughly PREPARES CANDIDATES for the above Exams. by correspondence; no books are required.—For particulars and testimonials apply, "Certified Coach," 31, Herbert-road, Plumstead, S.E. 5

**ANSELL and MALLOWS, Architectural** Draughtsmen and Quantity Surveyors, 21, Buckingham-street, Strand, W.C. 1

**R. I.B.A. EXAMS. PREPARATION,** personally or by correspondence, in three, six, nine, or twelve months' courses. Architectural Lending Library. Special three months' finishing courses.—For full particulars apply to Messrs. HOWGATE and BOND, Associates R.I.B.A., Perchard House, 70, Gower-street, W.C. (close to the British Museum)

**L AND SURVEYING and LEVELLING.** Course of EIGHT LECTURES (Wednesday evenings), and EIGHT FIELD LESSONS (Saturday afternoons). Commences April 26. Fee, £3 3s. MIDDLETON and CARDEN, 19, Craven-street, W.C. 8

**MASON'S CHISEL, STEEL,**  $\frac{1}{2}$  to  $1\frac{1}{8}$  octagon, 12s. to 16s. per cwt.; Chisels, 6d. lb.; Best Cast Steel for Lettering Tools, &c., from  $\frac{1}{2}$  in. to 4d. lb.—E. DEALEY, Moore-street, Sheffield. 13

## APPOINTMENTS VACANT.

The charge for Advertisements under this heading is 1s. 6d. per insertion not exceeding four lines, and 6d. per line afterwards, prepaid. Three insertions may be had for the price of two.

**WANTED (North), good all-round ASSISTANT.** Experienced, energetic, and obliging. Able to take out quantities, and manage in principal's absence. State particulars, age, and salary expected.—Box No. 1021, Office of BUILDERS' JOURNAL. 2

**BUILDER'S CLERK and TIMEKEEPER;** small shop, seaside; p.c. contract and jobbing a.c.; estimates and general assistance; quick and energetic.—Address, stating age, salary, &c., 3, Bellevue-terrace, Cheriton, Folkestone. 1

**TRAVELLING ADVISORY ENGINEER** WANTED by a firm of Sanitary Engineers; London Architect or Builder's Managing Clerk and Draughtsman preferred.—Apply, stating age, qualifications, and salary expected, Box 1034, BUILDERS' JOURNAL Office. 1

## APPOINTMENTS WANTED.

The charge for Advertisements under this heading is 1s. 6d. per insertion not exceeding four lines, and 6d. per line afterwards, prepaid. Three insertions may be had for the price of two.

**YOUNG ARCHITECT, A.R.I.B.A.,** ASSISTS in the PREPARATION of DRAWINGS, TRACINGS, &c., at his own Office. G. SCORER, 28, Newman-street, W. 1

**QUANTITIES** prepared, specifications written, works measured, and variations adjusted by reliable London Surveyor. Over twenty years' experience. Special terms by arrangement.—"Surveyor," office of the BUILDERS' JOURNAL. 38

**QUANTITIES** prepared for ARCHITECTS and SURVEYORS on Mutual terms. Accuracy and promptitude guaranteed. References given. Box 1017, BUILDERS' JOURNAL. 1

**YOUNG SURVEYOR (P.A.S.I.)** Makes Plans of Buildings and Surveys of Building sites during his spare time. Assistance rendered with Quantities. Sanitary and dilapidation surveys made.—Box 1029, BUILDERS' JOURNAL Office. 1

**ARCHITECTS and QUANTITY SURVEYORS.**—Temporary ASSISTANCE rendered in taking-off, measuring, &c., either by commission or the hour; reference given.—"H. E. A.," 33, Fontarabia-road, Clapham Common. 3

**BUILDER'S CLERK and GENERAL ASSISTANT.** Thorough practical knowledge of the trade. Aged 27.—Apply, J. MASON, 25, Western-street, Bedford. 1

**QUANTITIES** prepared and Specifications written, if desired, for architects and surveyors. Prompt attention given. Mutual Terms.—"J. F.," care of Venns, The Broadway, Highbury Park, N. 3

**ARCHITECT'S ASSISTANT** requires ENGAGEMENT in JUNIOR capacity. Country preferred. Small salary commencing.—Address C. H. LENTON, Clifton, Biggleswade, Beds. 1

**ADVERTISER** seeks ENGAGEMENT as IMPROVER and JUNIOR ASSISTANT. Neat and quick tracer and colourist. Able to make small surveys, plottings, &c. Small salary. Excellent references.—Apply, "M.," 30, Melody-road, Wandsworth, S.W. 1

**CLERK of WORKS or FOREMAN** of MASONS; experienced man seeks position as above; thoroughly reliable; excellent references.—Box 1037, BUILDERS' JOURNAL Office. 3

**ARCHITECT'S and SURVEYOR'S ASSISTANT** requires RE-ENGAGEMENT. Quantities, specifications, working drawings and details. Good references. Southern counties preferred.—Address, Box 1039, BUILDERS' JOURNAL Office. 1

## An Architectural Causerie.

### The Art of William Morris.

*"What such a man thought worth doing was clearly worth taking seriously."*

—If anyone wishes to know as much of the artist as Mr. Day; as much of the principles of decorative art as may be learnt by studying under the guidance of the most accomplished of designers, and wishes, moreover, to have on his table a beautifully pictured memorial of one whose spirit only is with us, he may be advised to acquire and preserve the Easter Number of the "Art Journal," which contains a varied and comprehensive selection from the works of William Morris. One who hated machines so heartily would be sorry to hear that the sheets of this tribute cannot be sewn instead of being fastened by wire, which is certainly the vilest application of this humble utility that has been invented. There should be no talk about time and expense on such an occasion, and we cannot help thinking of him while rending the pages asunder. It is said that the most eagerly expected of books to be published this spring is "Morris's Life," by Mr. McKail which will be not only the work of a classical scholar, and one especially fitted to deal with the literary side of his character, but will be, moreover, the most intimate account of the whole man that can be allowed to appear. Contributory to this biography have been the various memoirs which have been written: notably Herbert P. Horn's in the "Saturday." There have also been lectures about him, and volumes of letters from Rossetti to various people in which we hear a great deal of Morris as one of the circle. Mr. Day, keeping close to his subject, displays a sympathetic understanding of a spirit but little akin to his own, which is exceedingly gratifying, and makes his contribution appear a remarkably, able performance. We who loved Morris unthinkingly are prepared at this date to read, mark, learn, and digest whatever is said of his work, but I for my part have read nothing so attentively as what Mr. Day has just written. If there be 25,000 true lovers of Fitzgerald's translations of the Rubaiyat—as many, in fact, as have purchased the latest and cheapest edition—then are there as many thousands who would be more than delighted to see the copy engrossed and illuminated by Morris, which remains with Lady Burne-Jones. We are shown an exquisite cover-design, and left to imagine the rest. It is feared, so said Mr. Ellis, that it would be impossible to do justice to the original, whatever attempts might be made to reproduce the true colours. There could be no surer proof of the poet's delight in the poem than we have in the fact that he bestowed so much labour upon it. Art is "Love at Work," said someone—neither logician nor lexicographer. E. R.

### Railways and Suburban London.

How often have we, travelling to town or from it, glanced from the carriage windows of our suburban train and glimpsed, as we flitted past, the boards which proclaim, "Building Land, ripe for development," and holding forth eloquent appeals to building speculators to come and build, on more or less advantageous terms! We know those boards well. Some of them we have known so long that they are become veritable landmarks. Before our time they were standing in those self-same meadows, and when we have grown tired of our especial suburban retreat and gone to fresh fields and pastures new, they will still be there, if, indeed, storms or natural decay have not levelled them in ruin. It is quite unlikely that the sought-for speculator will have come and built, even though the ground be in fact "ripe," or rotten ripe. For one thing, your average speculator in building sites is a man with a level head for business,

utterly fails to properly convey the vast floating populations which travel daily between their work in the City and their homes at Finsbury Park, Holloway, Wood Green, and the dozens of other crowded suburbs on the northern heights of London. Seven years ago the then Chairman of the Great Northern Railway stated at a public meeting that the suburban traffic along his Company's system was increasing "by leaps and bounds." On another occasion he said that they carried one million additional suburban passengers every year, and that they were at their wits' end how to cope with the multitude. The Company has done nothing yet, and meanwhile house property and the value of building land have gone down in the regions served (and served badly) by the Great Northern. It must inevitably be so when it is said that many who live at Finsbury Park prefer to ride to and from town by tramway, which is at once a cheaper and a much more speedy method of transport. That a horsed tramcar should in the year 1899 be proved a quicker means of transport than the railway is enough to make Stephenson turn in his grave. The Great Northern is little

A SUBURBAN STATION: WORCESTER PARK. DRAWN BY CHARLES G. HARPER.

and the first thing he enquires about, in circumstances of this kind, is the ease or otherwise of travelling to and from the spot. Now it is notorious that for the last ten or fifteen years suburban railway travelling has been going from bad to worse, keeping many Londoners who would otherwise prefer to reside some ten to twenty miles out living still within sound of Bow Bells, and driving those who have hitherto dwelt in the suburbs into more central districts. The matter has grown serious. The natural growth of London's outer circle of suburbs is stunted, and the progressive growth in the value of land arrested very greatly. The adage that "Time means money" was never, in fact, better exemplified than in these circumstances. It takes long for suffering suburban residents to begin action against the railways that serve them so badly, but their voices are at last being heard, and the absurdity of being carried at ten or twelve miles an hour at heavy fares is beginning to be pointed out with a certain amount of asperity. The Great Northern has achieved an ignoble pre-eminence in this respect, and

worse than its rivals. The South-Eastern and the Chatham and Dover are bad enough, and the South-Western Railway has by its heavy fares, consistent unpunctuality, and the suspension of ordinary time-tables in the racing season, helped to kill many a promising suburb. If season-ticket holders find their ordinary trains taken off to allow the South-Western's race-course patrons to travel express, little surprise need be felt when they seek homes on some railway with more consideration, or, more probably, go to reside in town again. Let us instance what promised some years since to become the flourishing suburb of Worcester Park, beyond Wimbledon. It is only ten and a half miles from Waterloo, yet one could travel more than half-way to Brighton in the time that the South-Western takes to convey passengers along that course. For it is no use relying upon time-tables, which show travelling at something like twenty miles an hour to Worcester Park. Actual experience allows a wide margin under the best circumstances, while under the worst the belated passengers only get home from the City in time for supper and bed. That is probably why Worcester Park remains so pleasantly rural, to the despair of house agents. Meanwhile the station is probably the most picturesque round London. C. G. H.

## On Reflection.

The R.I.B.A. to the fore.

IT is not for the first time in its history that the R.I.B.A. has taken the initiative in procuring a just recognition for the needs of architecture in such a manner as to incur the indebtedness of the profession. The body has acted with great alertness and acumen in discerning issues, in certain of the clauses, which involve a depreciation of architectural qualities in the future buildings of London, and the imposition of an excessive and unnecessary burden upon the practitioner, whose profession is already unreasonably beset with limitations and restrictions. It is unlikely that these considerations would present themselves to those to whom is entrusted the framing of our laws, but the letter which the Institute, through its secretaries, has addressed to the First Lord of the Treasury puts the case for architects forcibly and clearly, and Mr. Balfour, who, unlike the late leader of the Opposition, has discernments which reach beyond political matters, may be expected to duly weigh the objections which are here advanced to certain proposals of the bill. For our own part we entirely appreciate the case made out in this letter. The point raised in Section 3 of the letter, which calls attention to the incongruity of designs for large and important buildings from the hands of eminent architects being left to the discretion of building inspectors acting on behalf of district surveyors, who in turn are in the employ and embody the prejudices of a local borough corporation, is particularly forcible. Apart from any other consideration, the clauses of an Act which clearly involves such an affront to a reputable profession, and so great a depreciation of architectural merit, are entirely unjustified. As it is, a great deal of unnecessary difficulties are thrust in the path of the practising architect by the neglect of the principles of centralisation advocated in this letter. The variations in the sanitary bye-laws in different parts of London under various local authorities, are a constant source of trouble and misunderstanding to all parties alike, and in other connections this same lack of unanimity of the regulations throughout London is the cause of a vast increase in the number of annoyances attached to building operations. As an instance we may quote the case of the regulations governing the arrangement of public houses. There are twenty-four licensing divisions in London for this purpose, each with different justices and different rules. In the City, for instance, the public bar has to be divided with glazed screens throughout and with clear glass; elsewhere other rules apply. We hope that the letter to which we call attention will serve some substantial end in bringing about a modification of the splitting up of responsibilities and authorities so far as the regulations and laws relating to building are concerned.

The L.C.C. as Landlord.

WHEN the ground was cleared for the southern approach to the Black-wall Tunnel, about 160 houses, most of them more or less dilapidated and insanitary, were pulled down. In their places have been erected a number of clean and neat little cottages, which certainly have a rather attractive appearance; and one is disposed

to congratulate the London County Council upon having provided for the poor people they were obliged to dispossess dwellings of a more homelike and less forbidding character than the usual "model" blocks. But there is another side to the question; and if the statements made by a "Times" correspondent in a recent article are correct, it must be admitted that this particular housing scheme has been, to a very great extent, a failure. To begin with, the Council pulled down a large number of houses before any accommodation was provided for the families to be displaced. The immediate effect of this was to almost double the rents of the surrounding houses, and presumably to increase the over-crowding, and so intensify the insanitary conditions. That is a mistake which seems to apply to all the Council's building operations; in the Boundary Street area at Shoreditch, only a small proportion (about a third we believe) of the people displaced have been rehoused by the Council. The demolition of insanitary areas is a desirable thing, provided proper arrangements are made for the immediate rehousing of those dispossessed; without such arrangements the harm done may be greater than the good. In the case of this Greenwich property it would have been quite possible to build new houses in advance of the demolition of the old ones, as the Council owned a large area round this site. The rents of the new cottages, it is stated, are higher than those of the old ones, owing—the "Times" correspondent suggests—to the extravagances of the Works Department, by which they were constructed; moreover, they are by no means such desirable dwellings as they appear from the outside, being, in fact, extremely inconvenient in many respects. "It is no exaggeration to say," writes the "Times" correspondent, "that the L.C.C. only find tenants for these tenements and cottages because of the very great difficulty in getting any sort of house in East Greenwich, but very few of their tenants make a long stay." The writer is particularly indignant at the Council's determination not to allow overcrowding in their tenements. Here we can hardly agree with him. No doubt it is hard on a labourer, whose wages are only, perhaps, £1 a week, that he may not occupy a two-roomed tenement if he has more than two children. But what are the Council to do? Are they to ignore the Public Health Act, and allow overcrowding to an unlimited extent? We cannot blame them for insisting on reasonably healthful conditions amongst the tenants of their property; though it is wise sometimes to allow a certain latitude in the administration of the rules. For instance, the Council will not let one of these cottages to a family where there are more than six children. If a man takes a cottage when he has no more than the orthodox number of children, and afterwards a seventh puts in an appearance, he will receive the following notice:—"Unless you are able to make arrangements for some of your family to leave you, so as to reduce your number to two persons per room, or to find accommodation elsewhere, the Council will be reluctantly compelled to terminate your tenancy by notice to quit." The "Times" writer points out very bluntly, not to say brutally, the possible evil results of such a regulation. Without enlarging upon this aspect of the matter, we would suggest that in such a case not much harm would be done if the Council's officials would adopt the tactics of Brer Rabbit—"lie low and say nuffin."

Secret Commissions.

THERE is surely no business, trade, or profession, which can view the many assurances we have of the vigorous nature of the approaching crusade against the custom of secret commissions with any other sentiment than one of deep satisfaction. When Lord Russell introduces his forthcoming bill to the House of Lords, he may feel confident that he has the nation at his back. Neither those who have conformed to the custom of paying bribes, nor those whose *employées* have accepted secret commissions, nor those who have declined neither to accept nor offer them, nor, indeed, those who are placed outside the sphere within which the custom operates, wish otherwise than to see the enervating custom wiped out. Originally a facility adopted by unprincipled persons, it has gradually found root and flourished by inducement of the keenness of commercial competition, and the desperate alertness which enthralled those who seek to hold their own as bread-winners in a civilisation based on a meshing of telegraph wires and railway lines till it has become a custom. Beginning as an occasional stimulant to business, it has grown to an established habit, and, like the morphia habit, has ceased to be an assistance and grown a burden. Nevertheless, for all the wide and general acceptance the usage has received, it has not radically changed in its moral aspect. Sir Edward Fry, on the occasion of the last monthly dinner of the Chamber of Commerce, told his audience of the deeply affecting letters he had received from men who had written to tell him their experiences; and the speaker referred to the terrible position of men of high feeling and sensitive conscientiousness who, with the alternative of ruin facing them, are induced to falsify their most sacred ideals. Not less remarkable were the words in which Lord Russell spoke of the letter he had on the other hand received from private persons and from business firms, passionately urging and imploring him to refrain from indicating them in any public utterances upon this subject. There is no doubt that not only the general public, but practical men of affairs have lived in entire ignorance of the state of things revealed by the report of the late special committee. At a recent meeting of the British Medical Association a resolution was passed authorising the Council to call upon the Chamber of Commerce to substantiate the charges against the medical profession which appear in the committee's report, and to offer such assistance to the association as may aid them in stamping out such custom. Would not this occasion, supported by the above precedent, offer a worthy opportunity and pretext for the R.I.B.A. to take some substantial action to discredit the custom among architects, who, in common with engineers and by reason of their peculiar duties as agents, are open to great temptation. The members of the Institute themselves are very much less gravely implicated in this discreditable custom than the bulk of the profession, but the following incident, which is a fact, shows how deep-rooted the system is in certain provincial centres. A London architect was commissioned to execute some small work in the country near London, where he resided, and invited a tender from a local builder. After viewing the drawings the builder asked, "Well, what have I to pay?" When at length the nature of his question was made clear, the architect had some difficulty in assuring the builder that he would accept no commission. Finally, the builder backed out of the room, shaking his head in doubt and perplexity, and wrote the next day declining to tender. He felt that there was something underhand in the transaction; that it was not fair and above board!

## NOVELTY IN ART.

By R. S. BALFOUR.

(Concluded from page 146.)

WHAT must have been the increasing criticisms endured by those who introduced in succession all the various types and styles of Architecture, if we can bring ourselves to believe that a continual hostility was shown to any novelty, from time immemorial. From the trabeated styles of Egypt,

responsibility involved in the designing of the earlier domes, and of all the intricate problems which had to be solved and of the difficulties which had to be surmounted in their construction. The men who formulated such wild seeming schemes as these appeared, must have been as callous to criticism as they were confident in their ability to create something novel. Absolute determination and belief in themselves must have been the leading characteristics of William of Wykeham and Brunelleschi, when they could, in the face of all the opposition they encountered, realize

doctrines enunciated by himself have at length obtained credence with the world at large, and so in like manner there can be no moment in the professional career of an architect more gratifying than when he finds that, through his own instrumentality, a new phase of his Art is gaining the approval and appreciation of mankind.

For long we have been content to dally alternately with all the various styles, we have exploited each one in turn, we have been imitating and adapting or mutilating the features and forms of each, until most of them

ABERDARE HALL, CARDIFF: A DINING-ROOM FIREPLACE. HERBERT W. WILLS, A.R.I.B.A., ARCHITECT (see page 161).

Assyria, and Greece to the introduction of the arch in Etruria (itself the greatest novelty Architecture has ever known), which has held an unrivalled place in all architectural composition and construction up to the present day, when its place is gradually being monopolised by the metal girder; through all the minor variations in the different orders of the classic styles, or those of the various periods of Gothic, each one of which might well have been the field of a far more widespread controversy than anything we dare contemplate at the present day. Consider what infinite patience and thought must have been bestowed on each new step towards the development of the vault, each increase in the span, and each diminution of the support. Think of the

their ambitions and carry out successfully their departures from precedent.

And when we look backward and observe how each style and feature has attained a notable popularity in a greater or lesser degree, and how each example has become in turn an object which we apotheosize in these present days of exaggerated sentiment, should we not hesitate to criticise, cavil at, and condemn the works of men whom we consider to belong to an ultra advanced school, lest we may in years to come repent of the strictures we passed upon them, when at length their persistent efforts have been acknowledged as worthy of consideration.

Truly there can be no prouder time in any man's life, than when he becomes conscious that

have lost all their former significance in the chaos of modern work. But are we for ever to be contented with variation and repetition? Are we to remain constantly satisfied with forms long approved in the purposes for which they were invented; to mimic them time after time without compunction, with, it may be, senseless and trivial modification, all for the sake of imitation, in new materials such as science is daily placing at our disposal; no matter how alien their structure, or how widely dissevered the possibilities of their manipulation, and without any due consideration of their adaptability?

Let it be granted that novelty of design in Architecture demands from its originators no small degree of decision and confidence in

their own ability to command success. It is easy to understand reticence and a prudent reserve in the design of some great public or monumental structure which has to be executed in the most durable of materials in a prominent situation. In such a case it is even excusable that an architect should sink his own individuality lest he may be the cause of a wholesale condemnation of the taste of his fellow-countrymen at some future date.

But the last half century has witnessed the creation of a new field for the conduct of his experiments. Formerly, no building was undertaken except such as was intended to be of a permanent character. If the experiment of its architect at novelty was a failure, evidently its effect upon his reputation, like the nature of his work, must be a permanent one. Nowadays, when vast sums are spent on temporary buildings, such as those used for exhibition purposes, the length of whose existence is to be reckoned in fewer months than the tale of centuries which our ancient buildings have witnessed, there can be no excuse save only of indifference, that on such occasions we do not steadfastly set our faces against the recognition of the claims of tradition. Notwithstanding all the opportunities which have occurred during the last few decades, how limited is the number of instances in which it is possible to recall even the slightest attempt at radical departure in favor of any fresh conception of an architectural ideal. An ill-considered adoption of various recognised types, together with a crude assortment of meretricious ornaments,

appear to hold the balance of popular approval, with the careful and authentic reproduction of the design of some old town or street as its antithesis. If the theory which commonly obtained, that exhibitions are the best available means of fostering both Art and trade, has stood the test of practical experience, it is certainly very remarkable that the number of experiments in novelty of design are so infinitesimal, and still more so, that notwithstanding our incomparable advance of scientific knowledge and acquaintance with the elements of which our globe is composed, the number of materials which are utilised for the construction of these buildings have shown only a very slight increase, an increase by no means commensurate with the extensive discoveries of chemical research which has rendered the present era such a remarkable one.

Nowadays when iron and steel construction appeals so forcibly to us for the inauguration of a new style of Architecture, or, at all events, for the recognition of their legitimate claims, we close our apathetic ears to the demand for truth and frankness, and inclose our metal girders in wood coverings, or else construct beneath sham arches in lath and plaster, we case up our stanchions with marble slabs, and conceal our cantilevers in papier-maché coverings of regulation design, in order to try and conceal the obvious, to avoid even the semblance of the novelty of truth, lest we should have to plead guilty of a breach of precedent.

Fortunately for us engineering is an Art which has no hesitation in expressing its requirements and purposes, it is therefore

a more lively art nowadays than Architecture, in that it can boast of a far greater progression and production of new ideas. It has apparently usurped the place which Architecture occupied prior to the Renaissance, and its outcome is to train up in us a new sense of admiration and appreciation of its unconcealed simplicity, directness of intention, and the purpose of its existence. In future days will not the Forth Bridge, for instance, acquire a new significance in our eyes, for is it not a healthy offshoot of a new branch of Art. Modern engineering is to all practical intents an art which is governed by no precedents for the assistance of its votaries, and no traditions for their detriment, yet no architectural production in this century, at all events, can rival the novelties displayed in any great engineering work accomplished within the same period.

Still, at the present time there appear to be hopeful signs of a fresh revival in Architecture, for many are the evidences of dissatisfaction and the weariness of monotony. There are enthusiasts in the profession who are struggling for novelty. Even supposing their efforts may not always be considered successful by others, it must still be admitted that their work is most interesting and instructive. If its present exponents have their mannerisms, that is a fault which time will eliminate. Mannerisms are easily acquired, and far more easily copied, and therefore they are undesirable, in that imitation tends to reduce the value of the thing imitated. Will not the squat column, with its unseemly

entasis, the heart-shaped opening cut out of the now fashionable outside shutter of cottage architecture, and that darling of the present day decorative artist, the conventional tree with its complexity of spreading branches at its summit and its wonderful birds; will not all these in time become the portion of the speculative builder and the middle-class "painter and decorator," and then, their originators having placed these items under a ban, we shall class them in the category of things to be abhorred, just as we did in the case of the once well-beloved stop-chamfer, the vanished pitch pine ecclesiastical fitting, and the sash window subdivided into panes only above the meeting rail.

This a tiele has no pretence to be anything more than as it were a preface or introduction to a vastly attractive subject, each branch of which demands for its elucidation no small degree of patience and time. Its study will be found redolent with the intellectual savour of former ages, for it will enable us to grasp the evolution of thought required for the compassing of matters which we daily take for granted. Above all, its study will lead us to trace the divers paths which lead to those fresh developments and improvements which, if they are adopted by mankind, may perhaps result in placing their originators among the benefactors of our race.

**A Quarry Accident.**—An accident occurred last Wednesday at the Raemoir Quarry, Hill of Fair, Aberdeen, owned by the Hill of Fare Quarrying Company. A 10-ton crane, with a pitch-pine jib 62ft. long, was lowering a block of stone to the bottom of the quarry, 120ft. deep, when the jib suddenly snapped in being raised, and the stone fell, knocking the foreman backwards and stunning and severely bruising him. The man had a very narrow escape of being knocked into the quarry and killed.

## THE ABERDARE HALL, CARDIFF.

IN these times, when so much that is pretentious and fussy is being erected in our large towns, it is quite refreshing to find a building treated with such simplicity and breadth as the Aberdare Hall, Cardiff. The dignity of a design such as this is enhanced by comparison with the usual "public-house" type of Architecture so prevalent in most of our "growing" towns. This building, which was designed by Mr. H. W. Wills, A.R.I.B.A., of Swansea, is a Hall of Residence for the women students attending the University College of Cardiff. The portion at present erected (about two-thirds of the whole) was built in 1894 at a cost of £26500. It is built with Bracknell red bricks with terra-cotta dressings and tiled roofs. The windows are glazed with lead lights in iron casements. The wing not yet erected to the right of the entrance doorway will cost £3500, and will make the total accommodation to sufficient for 80 students. The inside work is of pine and painted. The day and dining rooms have a panelled dado, and are divided by a screen with glazed circular-headed top lights and moulded balusters, the pilasters at the sides of screen being ornamented with strap carving. The internal fittings generally are original in treatment, and bear the impress of thought, from the entrance door to a cupboard hinge. Unfortunately, now-a-days, an architect's work too often finishes with the outside of a building, the inside work being neglected, or left to the whim of a client, which generally amounts to the same thing. How often do we find in a specification that "the grates, mantels, &c., will be selected by the owner," which generally results in the acquisition of some enamelled slate monstrosities entirely out of keeping with the rest of the building. In the case of the Aberdare Hall the architect does not seem to have been so hampered, but has been allowed to work out his own salvation, with the result that the whole of the work is in keeping both internally and externally. The excellent results accruing from this are especially noticeable in the fireplace designs, two of which we publish. The entrance gateway is also characteristically treated with an

overhanging lamp and well designed wrought-iron gates, leading to the main entrance with its panelled and nail-studded doors.

The building stands in the Corbett Road, at the rear of Cathays Park, and immediately behind the site of the new Town Hall and Law Courts about to be erected from designs by Messrs. Lanchester, Stewart, and Rickards. It is skirted on the left by the grounds of Cardiff Castle, so there will be at least three places of interest in this part of Cardiff not to be missed by lovers of "Architecture as it should be."

## THE ARCHITECTURAL MUSEUM.

BY E. B. HOARE.

THE title of the Royal Architectural Museum (open daily from 10 a.m. to 4 p.m.) conveys but little to the passer-by, who probably has not even noticed the iron flags on the lamp-posts outside Dean's Gate. The passer-by, as a general rule, does not notice much, and anything that is not obvious remains unseen. But the cult of observation is becoming more studied, and the evolution of the "poster" tends to increase this. All are agreed as to the merits of the cult of observation! Following then the direction of the little iron flags, we thread our way through Dean's Yard in safety, if the scholars are not playing football, and in considerable danger if they are. Dean's Yard is always a great disappointment to the artist mind, so black and dirty, so different from what it might have been; its Gothic windows filled with plate glass reflecting the sunlight with splendour. Through the arch at the south corner we see the object of our search in a street, which is small and squalid, full of life, and alas! full of death: for death there must be where such squalor abounds!

The "Architectural Museum" which stands in the brighter portion of the street is a pretentious building, in a style which may have taken a Venetian palace as its model. It is built in red brick, composing a scheme of pointed arches, and decorated with coloured

tiles and other protruding ornaments, with statues either side of the main entrance in canopied niches, one of which represents William Rufus holding a miniature Westminster Abbey in his hands—a strange spectacle in such a street. Strange as it is outside, it is doubly strange within. Drawing aside a heavy curtain, and passing between two Cerberus-like persons with crowns on their heads, we discover, and are surprised at the discovery, that the main hall is filled with ladies in different coloured blouses, drawing from the antique; one naturally asks whether this was the museum we came to visit, but looking round, the architectural nature of the institution is obvious.

A great centre hall, lighted from the roof, is surrounded by two galleries supported by wooden pillars, iron girders and other such methods of construction. The galleries are approached by an iron staircase in the north-west corner, and lead to different class rooms. On every possible peg, on every tie beam or strut, and in every nook and corner is there suspended some specimen of architectural detail, Gothic or otherwise, plaster casts all of them, which age has given the appearance of stone, and which dirt has mellowed into the appearance of great age; and on the ground floor, incongruous as it seems, are casts of some of the great statues of the world's history. The Venus of Milo, for instance, is almost standing on the cast of an ancient Saxon font, framed, though partly screened, by a white sheet hung there to give full value to the "contour" of the figure, in the arcading from "Notre Dame" at Paris. Her eyes are fixed on the tomb of some mediæval worthy, while above her head are festoons of Gothic caps from Westminster Abbey, Lincoln Minster, and elsewhere. Again, the "Dancing Faun," gazing at the recumbent figures of heroes of yesterday, still continues to dance, as it were, in the glades of Thessaly, to the edification and delectation of the art student.

These details are entirely unheeded by the habitués of the museum; daily do they pass through this curious maze of ancient, mediæval, and modern art; for the most part they are unaware that there is, concealed behind the dirt and dust that reigns, much of

beauty and interest. On the wall of the staircase there are some panels of Italian detail, full of grace and charm, some interesting shields with the emblems of the Passion carved on them; on the first floor several panels of excellent stained glass; stowed away in a dark corner are some models of country churches, deftly made; and more ambitious still, on the top floor, a model of Salisbury Cathedral, of a Greek temple, a cast of some Indian details, casts of the angel spandrels in Westminster Abbey, and among all these, one cannot help noticing the noble Saxon fonts, the Egyptian monolith, and the strange god or goddess, from Burmah perhaps, who, sphinx-like, sits and watches the life class men students resting during the intervals of work hard by; who listens to their idle talk of art, of the past and the present, nay, the future also; talking not without much speculation as to the places they will severally take in the world's art history.

In dirty weather the museum is gloomy. It appears to be haunted by weird Gothic spectres, by classical ghosts. Fair weather, on the other hand, shows up the grime of years, discloses all there is to see.

Without being historical it would be as well to inquire into the origin of this strange place. The architectural museum was started as an institution to be devoted mainly to the study of Gothic detail. During the early revival of Gothic architecture, the architects who were then in practice took up the scheme with pleasure; and a large number of those aspirants to the higher flights of church building formed themselves into a society which should start an institution or a museum where it would be possible to study Gothic detail. Theoretically a good scheme, it was also good in practice; and for many years these architects submitted their annual subscriptions and studied with assiduity the details which before had been difficult to approach.

The revival of Gothic Architecture was a new child, born of the absurd evolution of the classic period witnessed in the latter efforts of that period in London. It was an idea worth cultivating, and the success of it can hardly be estimated at its own value by those who practice to-day. They do not allow for the untrodden ground the early revivalists went over, nor for the mass of work they did. They, who have profited by the successes and the failures of these enthusiasts, do not realise the excellence of their ambitions and, indeed, the success of their conceptions. They do not allow all this, because experience has shown them that mere imitation will not suffice. But without the Gothic revival it is hard to say to what passes English church building would not have reached. The Gothic revivalists naturally found the architectural museum a boon to their work; where they were at sea in design, they had but to refer to the detail in the museum and all was made clear to them. Thus in these days, therefore, when modern architecture is looking up, and when design is more imbued with individuality—when, indeed, people have ceased to copy, it is not surprising that the museum for the study of architectural detail should, in its original scheme, decay.

So it came about that an art school was started, as the architectural subscriptions fell off, on Government principles; an art school which has, through the industry and excellence of its curator and teachers, raised itself to the level of the best metropolitan schools. Art reigns in this place in a way which is quite perceptible, although everything is against it, and its attendant circumstances are not ideal. Yet art seems the pervading spirit in the place. The work that is done here is good and the number of students is increasing. Owing to this increase the question of accommodation has become serious, and it has been found necessary to enlarge the premises, to free the study of the antique from its Gothic surroundings, and to make things more comfortable for the students. But, having described the museum as an architectural institution, it would be well to postpone the description of the museum as an art school till another occasion.

## VANISHING BRISTOL.

BY THE REV. H. J. FOSTER.

WITHIN very recent years there has been a great clearance of the remains of Old Bristol. So modern a book as Nichols and Taylor's "Bristol and Clifton" mentions many "bits" dear to the eye of an antiquary or an artist which have now disappeared. The Pithay, shown in the drawings by Mr. W. L. Clarke, reproduced in our inset plates, is being swept away at the present time. The gabled houses on the left, as a visitor faces up the ancient thoroughfare, are gone. A licensed house at the top of the rise is a vested interest not likely to be touched, and has as yet escaped; and the opposite side is for the present saved by the occupation of some of the houses by Messrs. J. S. Fry and Sons, of cocoa fame, and by an apparently prosperous vendor of all kinds of workmen's tools. But all that was picturesque is gone. Opposite the licensed house there faced into Wine Street a noble-looking mansion, whose parge-ted front bore an imposing set of armorial bearings, which bespoke an occupation in older days by tenants of no mean social standing; but only the merest skeleton of the timbered framing of the front is now left. The old Pithay will soon be a thing of the past; and the Llandoger Tavern in King Street, with its neighbours, shown in Mr. Clarke's other drawing, is also scheduled for early removal.

Such changes are inevitable, however one may regret the disappearance of these links between the present and the past. These "bits," which are the delight of the artist, become the despair of the sanitarian, and the difficulty of the guardians of order in the city. In the earlier years of the present century the Pithay became a "slum" of the worst type, the quarters of the beggary and violent rascaldom of the city. Mr. Charles Bird, the Bristol etcher, who has done so much to preserve Vanishing Bristol from utter forgetfulness, has given us "A Broil in the Pithay," in one of his series of plates. Broils were part of the daily life of the narrow street, whose old age had become too vile to be venerable.

Yet the old Pithay carries the thoughts back to the very beginnings of the city. The steep gradient of the short street is the slope of the face of the little plateau of New Red Marl, on which the most ancient Bristol stood, encircled and defended by the Avon and its tributary the Frome. At the upper end of the street was one of the gates in the first city wall, between whose foot and the Frome lay an open meadow, falling towards the river bank. The foundation of this wall was seen—6ft. thick—so late as 1820. The Frome runs in its old course to-day, but gropes its way in complete darkness under Union Street and other thoroughfares near at hand. The name Pithay preserves the memory of the meadow; it is the path down to the *puits de la haie*—the Well Close, as the East-end Londoner calls his Pithay. In Norman times, or earlier, a suburb sprang up in the meadow under the wall, which between 1069 and 1100 was inclosed by an outer wall that ran along the river bank. Over the Frome was built a bridge with a gate, the Pithay Gate of the later city defences. When Messrs. Fry erected their large works at the foot of the slope, portions of the masonry of bridge and gate were found. Both had disappeared in 1764. The gate carried two cannon, and the bridge, like Bristol and London Bridges, had houses on either side of its short length. Mr. Clarke's drawing shows how the ancient roadway across the meadow and down to the stream, now loses itself at the lower end in the heart of Messrs. Fry's premises. Their extensive works have also absorbed the Pithay Chapel, which stands in sadly faded respectability at the bottom of the hill, in a retired corner. It was rebuilt in 1791, but its predecessor belonged to the earliest Nonconformity of Bristol. It was built in 1653, to be the first distinctively Baptist church in the city, and from it have sprung the Old King Street and City Road churches of to-day. One

of its old pastors, Andrew Gifford, the son of a cooper in Redcliffe Street, was a strong partisan of the Duke of Monmouth, and only narrowly escaped being killed in a chance *melée* the day before Sedgemoor.

In 1618 the rector of Christ Church, Edward Shaw, had a rectory house granted to him in the Pithay, from which, in the stormy days of the Commonwealth, he was ejected to make way for a successor more pliant to the changes of the times. The well-known Bristol antiquary, Mr. W. Latimer, in his "Annals" says: "It would require a good imagination on the part of anyone now traversing the Pithay, and the sordid neighbouring thoroughfares lying between Broadmead and Tower Lane, to represent to himself the locality as a place of public recreation and fashionable resort. No more singular testimony of the local changes effected by time could well be adduced than is to be found in an advertisement published in the Bristol papers in May, 1810, announcing the sale of twenty-nine void old houses in the Pithay and Bowling-green, in the parish of Christ Church. Amongst the lots were "the timber and materials of the Old City Assembly Room, situate in the Bowling-green aforesaid"; and "the timber and materials of the Old City Assembly Rooms Tavern, in the same place." Both these buildings had been last in the occupation of a basket-maker. The ground is now occupied by Wellington Street and All Saints' Street. This Pithay Bowling-green was one of the earliest scenes of the open-air preaching of Whitefield and Wesley.

## ARCHITECTURAL ASSOCIATION.

### MODELLING AS APPLIED TO ARCHITECTURE.

BY F. W. POMEROY.

A MEETING of the Architectural Association was held last Friday evening at 9, Conduit Street, London, W., Mr. G. H. Fellowes Prynne in the chair. It was announced by the secretary that Mr. G. H. Fellowes Prynne had been re-elected president of the Association, and Mr. H. T. Hare, vice-president. Mr. F. W. Pomeroy then read a paper on "Modelling as Applied to Architecture," and gave several practical demonstrations. The author began by saying that the subject on the agenda paper was "Modelling as Applied to Architecture," but he had ventured, for the sake of comparison, to alter the title and subject of his paper to "Carving and Modelling as Applied to Architecture." He had derived much assistance from a paper by Professor E. A. Gardner, who had given much time to the subject. He was also indebted to his friends, Mr. Stirling Lee and Mr. Roscoe Mullins, for kind assistance.

#### Early Stages.

The history of art was ruled by the same great laws of Nature which influence all temporal things, and was rather a story of evolution than of creation. When the art of one nation ripened, the germs were carried to another soil, and taking root under new influences, sprung up again alike, but with climatic differences. The first enjoyment of man, beyond satisfying his animal propensities, was provided by rivalry. Hence the early history of all nations emerging out of savagery was the history of wars undertaken for the purpose of pre-eminence in a certain object. When a nation settled down, and cities were formed, the growth of handicrafts took place, and many artisans stepped forward, and a few artists. We had the builders, stonecutters, and carpenters, whose artistic development was architecture, sculpture, and painting. The house or living shrine had a threefold use: it was needed for the living man, for the dead, *i.e.*, the tomb, and for the incarnation of religion, *i.e.*, the temple or the church.

#### Primitive Ideas.

The idea of the primitive artist was to imitate his living models as nearly as possible, but the

LIBRARY  
OF THE  
UNIVERSITY OF ALBERTA

great merit of the early Egyptian and Greek sculptor was to reproduce in granite and marble literal copies of human or floral forms. The monumental simplicity of the Egyptian carvings showed the natural development of his resources. It was easier to trace in an unfinished work the methods employed. Mr. Pomeroy showed a picture of an unfinished statue lying near the quarries at Naxos; the legs from above the knees were lost. The first thing noticeable was the extreme flatness of the surface at the front, back, and sides. It had often been observed that many Archaic statues were square in shape—i.e., in the horizontal section—and this squareness also seemed to belong to all the schools connected with the beginning of sculpture; but in the Ionic types this squareness was rounded off at the corners. It was to be inferred that they were made on a process in which the front and side outlines were first drawn on the block, and then cut straight through parallel to the side and front lines, details being added and corners rounded off afterwards, but the general squareness of shape being preserved. Another example of an unfinished statue showed three small drill holes over the brow in the middle of the statue horizontally, made in pieces of marble, evidently left for the purpose, and intended to be worked off when the statue was finished. At the bottom were two corresponding holes, one between the feet and the other on the left foot. These holes must have served for the adjustment of a rod or line fixed vertically down the front plane of the block, to serve as a guide to the sculptor. There was not the slightest indication that a finished clay or plaster model was ever made to serve as a guide. A Greek artist of the best period may have helped himself by the use of sketches in clay. Many instances could be given that marbles were cut by a series of planes until the facets became so small that the work was completed.

#### Modelling in Clay.

From the earliest times modelling in clay was common and customary, as it was a material easy to work. The hardening by drying, baking and burning, had led to its use for a variety of ornamental purposes. Sun-dried clay was used by the Greeks for internal decorations. The use of terra-cotta was also very extensive. It was evident that modelling in clay must have preceded working in bronze or marble. Modelling in clay or soft wax was a system of building up by adding pieces of the material until the surface desired is arrived at. It could be worked with boxwood or ivory tools and wire, but the fingers and thumb were the modeller's tools *par excellence*. The art of modelling had reached its highest point in France, and there it was worked out with consummate skill. In conclusion, Mr. Pomeroy thought that a close and careful study of nature, by means of drawing, was the best means of getting at a full and proper understanding and appreciation of the great works of the past, and of producing real and living works in the future.

After the reading of the paper, Mr. Pomeroy demonstrated by means of a magic lantern the difference between the modeller and the sculptor, and showed the method of working of the modeller. Many pictures of the sculpture of the French style were shown, and also examples of bronze work. Illustrations of bas-reliefs in the Palace of Assarnasir, Venus of Milo, a bronze head in the British Museum, the statue of St. George at Florence, the gates of the Baptistery at Ghiberta, and a bronze representation of Perseus were exhibited.

#### THE DISCUSSION.

The president thanked Mr. Pomeroy for the very interesting and instructive lecture he had delivered, and thought that many of those present would realise that modelling was of great benefit to the architect. There was no single art or craft of more use to the architect than modelling. He believed that the true sculptor had more sympathy with the architect than the painter had.—Mr. Stirling Lee bore out what Mr. Pomeroy had said, and said the architect must not forget that modelling was an important help.

In designing a ceiling, a model in clay or plaster showed the architect exactly how the work would appear when finished.—Mr. Seth Smith recognised the great difference between the modelling and carving schools, and that the carver should be in perfect sympathy with the architect. A problem to be discussed was terra-cotta as a material for building purposes. Restraint should be exercised in its use. He also thought that the employment of models was a satisfactory way of arriving at an idea as to how the work would look when completed. It was a source of enjoyment to the architect to model, that is if he could find the time to do so. With regard to working over bronze castings, he considered that there was a disposition at present to leave the surface too coarse. Mr. McMillar referred to methods of modelling by means of dipping strips of canvas into plaster, with wax and with Portland cement.—Mr. Gandy offered a word or two in defence of terra-cotta, and said that any bad effects produced by its use were generally the fault of the worker, and not of the material.—Mr. Hart was in accordance with the lecturer on the importance of modelling in connection with Architecture.—Mr. E. Howley Simm wished to know what the lecturer thought about colouring sculpture.—Mr. I. Broad was another exponent of the value of terra-cotta, and thought it was the training they got which led them to its misuse. He considered that if the modeller in terra-cotta had the carver's training it would be an advantage. The chairman then proposed that a vote of thanks be passed to Mr. Pomeroy. This was done with acclamation, and Mr. Pomeroy, in his reply, said that with regard to the question put by Mr. Smith as to which was the best way to use terra-cotta, he would not attempt to answer it, as it would involve a very long explanation, but he thought it should be used more as a dressing. In some Italian and other work the terra-cotta dressing was agreeable, but he pointed out that when it was covered with a glaze or painted, it became disagreeable. Colour should be used with reticence in English buildings, although there was much scope for it in such places as London.

**A Memorial to Lady Cromer**, in the form of an asylum for foundlings and unprotected orphan children, is to be erected on ground adjoining the Egyptian Government hospital at Kasr-el-Aini, and will form a fitting monument to Lady Cromer's charitable works amongst all classes during her lifetime in Egypt.

**Bristol Association of Clerks of Works and Builders' Foremen.**—At the monthly meeting of this association, held at 11, High Street, on Tuesday, the first of a series of lectures on the five orders of architecture was given by the president of the association, Mr. W. Kidwell, and was listened to by a large number of members with interest. The lecture was illustrated by a series of limelight views, showing examples of the different orders of architecture; many views of the ancient ruins at Athens, our English cathedrals, and other interesting views being shown as examples.

**Bootle Electric Lighting.**—The question of lighting the borough of Bootle with electricity was started about fifteen months ago, when it was resolved to spend £33,500 in carrying out an electric lighting scheme, and £3,500 for the scheme generally. It is expected that the plant will be finished by this week. The supply station is situated in Pine Grove, and the system adopted is the three-wire continuous system, the current being supplied to consumers' lamps at a pressure of 220 volts. The carrying out of the work has been superintended by Mr. Thomas L. Miller, the consulting engineer to the Corporation, Mr. O. F. Francis acting as his clerk of works; the buildings are from the plans prepared by the borough engineer, Mr. J. A. Crowther. The contract has been carried out by Messrs. T. Parker and Co., Ltd., Wolverhampton, and at present Mr. F. A. Robins is acting as resident engineer.

## A "BUILDERS' JOURNAL" COMPETITION.

### DESIGNS FOR A COUNTRY HOUSE.

IN accordance with our announcements, we have arranged a competition, to be open to all our readers, for designs for a country house.

All intending competitors should read carefully the following details, which have been revised and amplified since the original announcement of the competition in our last week's issue.

As the competition is intended to meet the requirements of an individual correspondent, we append a statement of his wishes and, in making the awards, preference will be given to designs which most nearly comply with the following requirements:—

"I want a house long and low, with a large square entrance hall, to be used as a comfortable sitting-room, a wide staircase, and a gallery going partly round hall, a dining-room and boudoir for a lady, about six bedrooms, and three servants' rooms, with comfortable offices, &c. I want something a little unusual, either dark stained wood and thatch, or old timbers and thatch, and all kinds of angles and windows."

The house is to be built on a level site on the crown of a bank overlooking a large garden which is surrounded by woods. The grounds in which the house is to be built cover an area of  $6\frac{1}{2}$  acres, and are situated in the neighbourhood of Hythe. The house will face N.W., but the main entrance is to be at the back, facing S. The drainage runs N.N.E. The house is to be long and narrow; the roof may be thatch or tiles, but not slate; large eaves are desired. In addition to the requirements given above as to the rooms, it is desired that there should be a small study and two bathrooms—one in connection with the best bedroom. No stable is required. The cost of the house should be from £1,500 to £2,000.

Any intending competitor wishing to view the site can obtain the exact address by communicating with the Editor.

The designs submitted may include a perspective view, as well as plans and elevations, and must be accompanied by a brief specification (that is to say, a description of the house and the materials proposed to be used). They may be drawn to any convenient scale, but must be inked in and be without colour or wash.

Drawings must be despatched so as to reach the Editor of the BUILDERS' JOURNAL not later than May 24th; they must be submitted under a motto, accompanied by the name and address of the competitor, in a sealed envelope.

Premiums of £10 10s., £5 5s., and £2 2s., will be awarded for the three best designs. The services of a well-known architect will be secured to act as assessor. The three premiated designs will be forwarded to our correspondent, who may commission the carrying out of one of them; but it must be understood that our responsibility in the matter ends with the payment of the premiums.

The drawings will remain the property of their authors, but we reserve the right to reproduce any we think fit.

Lostwithel Wesleyan Church has been extended by the addition of a new transept.

## Enquiries Answered.

*The services of a large staff of experts, including all those engaged on "Specification," are at the disposal of readers who require information on architectural, constructional, or legal matters. Questions should in all cases be addressed to the Editor.*

### ARMORIAL BEARINGS.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—I have a design in which I wish to embody the arms of the Franciscan or Grey Friars. Can you tell me what they were?—Yours, &c., G. W. Great Yarmouth.

Religious orders, as such, have no heraldic insignia. Abbeys, and other religious foundations, possessed armorial bearings peculiar to each institution, generally those of the founders. G. C. R.

### EFFLORESCENCE ON TILES.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—Would you kindly inform me how to stop efflorescence appearing on the tiled floor of a verandah. The tiles are laid on slate slabs, and, after they are washed, the efflorescence will appear again. Various methods have been tried, all to no purpose. Putney. "SUBSCRIBER."

The efflorescence most probably arises from the fact of inferior clay having been used in the manufacture of the tiles, or in the tiles being underburnt. There is no remedy but to relay the tiles, although in time the efflorescence may possibly sweat itself out.

### ORNAMENTAL LETTERING.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—Could you give name and address of typefounder for the ornamental letters on the back cover of your Journal, March 15th, No. 214?

Do you know of any useful book giving alphabets for architects' plans and drawings? If so, title and publisher's name will oblige. Plymouth. J. B. F.

The lettering referred to is done by an artist for a special block; it is not type. However, Mr. McCoy, American type agent, of 54, Farringdon Road, London, E.C., has type very similar in style. In reply to the second question, "Alphabets, Old and New," by Lewis F. Day, price 3s. 6d., published by Batsford, 94, High Holborn, London, is a book that will probably suit your purpose.

### COLOURING PORTLAND CEMENT.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—Can you inform me how cement-plastering is coloured and finished so as to appear similar to buff terra-cotta? I have seen a few jobs in red brickwork and buff dressing, similar to buff terra-cotta, but am not sure whether the dressings were coloured cement or some kind of composition.—Yours faithfully, Dundalk. STUDENT.

Portland cement work is frequently coloured to imitate Mansfield, Bath, and other natural stones, and also terra-cotta. Portland cement dressing for brick façades may be formed *in situ*, or cast and built as the work proceeds, but in either case the Portland cement is coloured as required while the cement is in a plastic state. This method gives better and more lasting results than if the work is coloured externally. The colouring of Portland cement is effected by mixing mineral oxides of the required colour and proportion with the cement used for the surface coat. The quantity of oxide to be added to the cement depends upon the strength of the oxide. Coloured surfaces, cast or formed *in situ*, are greatly improved by brushing the work as soon as set with a solution of the same colour as used for surface coat. Earthy colours, like

Venetian red and umber, should not be used for colouring external cement work, as the colour soon fades, and sometimes scales. Roman cement, Sheppey cement, and Madeira cement, were formerly in general use for concrete dressings, but their use is now entirely superseded by Portland cement, which is stronger and more durable than either of the above-named cements. Artificial stones composed of hydraulic limes, sand, and stone dust—coloured as desired, and consolidated by hydraulic pressure, are also used for dressings, &c. These artificial stones are generally cast in moulds to the required forms and in some instances they are worked by hand, similar to natural stone.

W. MILLAR.

### INSTITUTE OF SANITARY ENGINEERS.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—Could you inform a reader through the columns of your valuable paper the address of the Institute of Sanitary Engineers, also cost per annum to Members and Fellows; whether any other qualification is required in addition to being a consulting and practical sanitary engineer, and are there any examinations to pass? S. E. Devizes.

The address of the Institute of Sanitary Engineers is 63, and 64, Chancery Lane, London. To become a Member or an Associate of the Institute, without the formality of nomination, it is necessary to pass an examination in the following subjects:—Building construction, water-supply and drainage, sanitary science as applied to buildings, and sanitary law. The fee for the examination is two guineas, and the candidate on passing is qualified to join the Institute as a Fellow or Associate, in accordance with the marks gained, and is exempt from payment of the entrance fee and half the annual subscription. The entrance fee for Fellows is two guineas, and the annual subscription is two guineas; and for Associates, and country Fellows the entrance fee and annual subscription are in each case one guinea. Further particulars can be obtained on application to the secretary.

### SURVEYORSHIPS AND ENGINEERING INSTITUTIONS.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—Will you kindly inform me whether borough surveyors have to pass any examination, and if so where I could procure a syllabus of the questions; also what is the procedure to be adopted to become a member or associate member of the Institute of Civil Engineers.—Yours truly, Winslow. SURVEYOR.

No examination is necessary to qualify a candidate for the post of borough or municipal surveyor. His chances of success will, however, be immeasurably increased if he has passed some recognised examination or is a member of one of the engineering institutions. The two principal are the Institution of Civil Engineers and the Incorporated Association of Municipal and County Engineers. Candidates are admitted to the Institution of Civil Engineers as students and associate members. Students must be over eighteen and under twenty-six years of age. They must be or must have been pupils of corporate members, and must be engaged in the profession of a civil engineer. Candidates for associate memberships must be over twenty-five years of age: (a) They must have been educated as civil engineers, and passed the examination appointed by the council; or (b) they must satisfy the council as to their training, have been engaged at least five years in the occupation of a civil engineer, and must be so engaged at the time of their application, and must also furnish a satisfactory thesis on a professional subject. Applications for election must be made to the Institution of Civil Engineers, Great George Street, S.W., on the proper forms supplied by the Secretary. Candidates for the Incorporated Association of Municipal

and County Engineers are admitted as members and graduates. Members must be engineers or surveyors holding chief permanent appointments under municipal corporations, county councils, or urban or rural sanitary authorities. Graduates must have passed the examination appointed by the association. Particulars can be obtained from the Secretary, 11, Great George Street, S.W.

### BUILDING CONSTRUCTION CLASSES.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—Would you be kind enough to inform me, through the valuable columns of your paper, the best and most economical institute for a young fellow to learn building construction.—Yours, &c. F. J. H. Hammersmith.

The classes at the Polytechnic, 309, Regent Street, and at the City of London College, Moorfields, may be recommended. The fees in both cases are very moderate.

## Correspondence.

### REGISTRATION OF ARCHITECTS.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—Would you be kind enough to give me your opinion, through the columns of your valuable paper, as to what would be the chief advantages or disadvantages gained if the above came to pass?—Yours faithfully, Liverpool. W. M. R.

[We shall be glad to publish the opinions of some of our readers on this subject, and reserve, for the present, our own.—Ed. B. J.]

### MAKING BLUE PRINTS.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—The following notes may prove of service as a supplement to the information given by G. A. T. M., in your issue of April 5th, page 133. If "Bricklayer" only requires to make a few copies at a time he may find it much cheaper to prepare his own printing paper; a roll of paper will seldom keep in good condition more than a few months, and if exposed to damp will quickly become useless. Procure two solutions: "A"—citrate of iron and ammonia, 4oz., water one pint; "B"—red prussiate of potash, 3oz., water one pint; and a roll of lightly sized printing paper of the desired strength. When required, equal quantities of the two solutions should be mixed together in a saucer, and applied evenly to the surface of the paper by means of a small sponge, this operation being performed either in gaslight, or in a well darkened room. When dry, the paper should be stored in a light tight drawer, or tin case. Never mix the solutions till they are required for use, and do not attempt to save any of the mixed solution which may be left over. The printing and washing should be done in the manner described by G. A. T. M., except that if the copy is required to be the same as the original, and not reversed, the drawing must be placed in the printing frame with the lines towards the glass; this is specially necessary if there is any printing or writing on the tracing. The tracing which has all the lines in deep black ink is the best, but most coloured lines may be reproduced (particularly reds and browns) if the exposure to the light is only carried far enough to give light blue prints.

Edinburgh. ALEXANDER DREW.

The New Free Church Hall, Laurencekirk, was opened last week. It is situated at the north end, and in connection with the church. The windows are of stained glass, and the heating is by a stove of the newest principle. The contractors were:—Mason, Mr. Crabb, Brechin; slater, Mr. Scott, Brechin; joiner, Mr. Dunbar, Laurencekirk; plumbers, Messrs. Rae and Son, Laurencekirk; painters, Messrs. Bruce and Son, Laurencekirk.

## Views and Reviews.

### FOR MATRICULATION STUDENTS.

The present half year's issue of this well-known Directory contains the papers set for the January, 1899, Matriculation Examination, with model answers to them. There is also provided much information on the regulations of this examination, with suggestions as to text-books for study, and notes on the special subjects for the examinations to be held in June, 1899, and January, 1900. The University Correspondence College Calendar is also bound up with the Directory and provides a most comprehensive epitome of information on the various examinations of the University of London. This College is generally recognised as the most suitable for a candidate for the examinations to attend, for during the past six years 4347 students of the College passed, and of those 431 obtained places in honours.

The Matriculation Directory, No. XXV., January 1899, with articles on the Special Subjects for June, 1899, and January 1900. University Tutorial Series. London: W. B. Clive, University Correspondence College Press. 1s. nett.

### APRIL EXHIBITIONS.

"Enough for one day; go home and think about what you've seen."—RUSKIN.

GOUPIE'S.—If the reader does not make haste he will not be able to see a choice selection of paintings by the Norwegian artist, Fitz Thaulow,—Norwegian by birth, it may be, but by no means confined to the soil, for we find him as far from his home as Venice, New York, and Paris. The view of "Washington Place, New York" might have been taken for one of Richmond Green, were it not that the houses are redder than older red bricks could be, and that the sward is greener than green. This is a very fine painting, however, and will be surely admired by those who say that our sorry old Earth is barren till the architect happens along. The painting of "A Side Canal, Venice," can hardly be praised too highly. It would appear that there are few of Nature's aspects with which the artist is not familiar—instance, "The Torrent"—and as nothing is shown but entirely successful work, we are not in a position to say what may have baffled the painter. In the Academy to be opened now shortly, there will hardly be one in a hundred pictures to praise, and the "sad mechanic exercise" of the critical faculty will become a painful necessity, but here there are just a few pictures to praise unreservedly, and little or nothing besides.

NEW ENGLISH ART CLUB.—An unusually good exhibition, for the "eccentrics" who formed the society appear to be more or less played out, and we find ourselves applying precisely the same tests to the pictures as we should if we found them elsewhere. Coming first upon drawings and things, one wonders whether No. 41, described as a "zincograph," is only one of a number of prints; if so it would seem that colour-printing has reached perfection, for, comparing this with a water-colour by the same artist, the differences are scarcely perceptible. The student of the pre-Raphaelite movement will notice a little painting by W. L. Windus, but nothing great in scale can fairly be asked of the man who painted "Burd Ellen," in 1856, if he indeed be the same. The landscapes are many, and not a few really excellent; it would seem to be possible to distinguish two influences here: that of Professor Brown, with whose paintings "The Redlands Farm," by Graham Robertson, may be compared, and that of the Frenchmen in general. We are told by Millet's biographer that a bit of smoked glass was considered an indispensable part of his outfit, and need not proceed to say what absolute ignorance of Nature's subtlest effects may be concealed by this simple contrivance. Mr. Wilson Steer has a style of his own which could hardly be copied even if it were desirable. His attempts to realise effects of light begotten by heat are generally fussy and unsatisfactory, the convention and consequent sacrifice being more in evidence than anything

else. Mr. Bertram Priestman is too great a painter to send his most important works to this exhibition. Already the greatest in his domain amongst the subservient animals, we have here, besides landscapes, a representation in monochrome of a ship wrecked at sea, which one looks at with wonder, whilst recognising that this, though only a study, is yet a great master's work. The subject pieces are few, but one to be remembered, and possibly never forgotten, is Mons. Belleroche's "Disappointment"—a girl, who has been consulting the cards as to her fortune, seated facing the spectator on a bedstead. It would be impossible to convey an idea in words of what art there is in the work.

E. R.

### ENGLISH COUNTRY COTTAGES.

The depopulation of rural districts is a subject of vital importance to the whole community, and that it may be in some measure due to the scarcity and bad condition of cottages in many districts is hardly open to question. At a recent meeting of the Cheshire Dairy Farmers' Association, a well-known landowner remarked that the remedy for the depopulation was "more cottages and better cottages."

We have just received a little book bearing the above title, the object of which, in the author's own words, is to call attention to the state of the cottages of the agricultural labouring population in England; and to give an idea of the sort of accommodation experience shows is desirable for labourers' dwellings. The book is full of statistics and useful information, and its 200 odd pages are divided into ten chapters, which deal with the present condition of our cottages in "close" and "open" villages, their rent, cost, and requirements. Drainage and water supply are fully treated, and a chapter is devoted to the Model Bye-laws.

Interspersed throughout the book are plans and elevations of typical cottages, but unfortunately they are not well "rendered," as our American friends tersely put it. The reproductions appear to have been made from bad tracings, and the drawings lose interest and intelligibility owing to the sectional parts being left in outline. Almost all the cottages that are illustrated have been built for owners of large estates, and it is curious to note how very few really fulfil the requirements of a good dwelling. In most the staircase leads out from a room, in some the fireplaces are arranged on outside walls, and few have any architectural merit. Probably the most interesting are a pair of cottages on Sir Walter Gilbey's estates, which is an attempt to construct dwellings that shall be commercially profitable. The plan is simple, consisting of a porch leading to the parlour, with a living-room behind in which is placed the staircase close to the back door, with a small pantry underneath. Upstairs are two good bedrooms and a smaller one for a child. The washhouse, coals and earth closet from a detached outbuilding. These cottages have brick footings to a height of 9ins. form the ground floor, above this the walls are built of sun-dried clay lumps, battened, externally covered with weather boarding and plastered inside. The cost is stated as amounting to only £265 the pair, but the expense of maintenance for such a wooden-covered building should be taken into consideration.

Two designs are shown of cottages on Lord Wantage's estate, both of which have good plans. The staircase in each example is approached from a lobby, which also gives access to the kitchen, with scullery and pantry behind. Three fair-sized bedrooms are arranged above, and the outbuildings consist of a coal place, w.c., and ashpit to each cottage, with one washhouse common to both. The walls are 11in. thick, built of brick, with a cavity in the centre. Cost is given at from £390 to £460 per pair.

A single story cottage is illustrated on page 225, which is said to have cost just £100; it is a very bad type of plan and should have been condemned by the

author. The two bedrooms and pantry all open out of the kitchen, and the pantry is actually larger than one of the bedrooms. Two single story galvanised iron cottages are also illustrated, but we could find no description of them. The two bedrooms in each case are entered from the kitchens, and the pantries are in the worst possible situation, being immediately behind the kitchen fire-places!

The author considers that, with regard to soil drainage, the less there is of it in rural districts the better. Earth closets are much more suitable and far less costly than water closets, but they should be periodically inspected and properly taken care of. A chapter is devoted to the Model Bye-laws, which the author very properly considers far too stringent for country districts, and a hindrance to many who wish to erect cottages for the agricultural classes.

The conclusions that Mr. Green arrives at are that the state of country cottages is, excepting in the case of owners of large estates, mostly very inferior, and in numerous cases so deplorable as to make desirable the interference of the local authorities, or in their default the Government; that the cottages are, as a rule, much inferior in "open" villages to those on agricultural properties; that the "Model Bye-laws" issued by the Local Government Board are in most cases unnecessary, and that it is practically impossible to make good cottage property pay even 2 per cent. on the capital outlay without considerably increasing the present rents.

On the whole, we can recommend all those interested in agricultural property to peruse this little book.

J. E. N.

"English Country Cottages; their Condition, Cost, and Requirements." Price 5s. By J. L. Green, F.S.S. The Rural World Publishing Co., 110, Strand, W.C.

### AN ELECTRICAL AND CHEMICAL DICTIONARY.

This dictionary of electrical engineering and chemistry is published in three parts—German-English-Spanish, English-Spanish-German, and Spanish-German-English. The dictionary comprises such words and word-combinations as are met with in books on engineering and scientific subjects; and special attention has been paid to practical terms relating to the construction of steam engines, machine tools, lifting and hoisting machinery, foundry, metallurgy (concentration of arcs), smelting, tools, &c. Non-technical terms that may be found in any ordinary dictionary are wisely omitted, so that more space may be devoted to scientific and technical words. Idioms which have more than one signification have their differences clearly pointed out. This first attempt to publish a reliable technical dictionary for these three languages fills a distinct gap.

"Practical Dictionary of Electrical Engineering and Chemistry in German, English, and Spanish: Treating especially of Modern Machine Industry, the Foundry, and Metallurgy." By Paul Heyne, assisted by Dr. E. Sánchez-Rosal. 3 Vols. London: H. Grevel and Co.

A Wesleyan Chapel is to be erected in Fulton Road, Walkley, at an estimated cost of £6,500, and will accommodate about 700 persons.

The Restoration of St. Mary's Church, Leicester, has been a subject of discussion in Leicester, and it has been decided to carry out the necessary renovations.

Death of a Chester Architect.—Mr. D. P. Fordham, a member of the firm of architects, Messrs. Douglas and Fordham, of Abbey Square, Chester, died last week. The deceased had been ill since 1897, when he was ordered by his medical advisers to a more southerly climate.

Memorial Screen at West Retford.—The family of the late rector of the parish church of West Retford (the Rev. Watkin Homfray) have just erected a carved oak chancel screen to his memory. The screen has been designed by Mr. Hodgson Fowler, architect, and the work carried out by Mr. Bown, of Stamford.

## Bricks and Mortar.

EFFINGHAM HOUSE, ARUNDEL STREET,  
April 19th 1899.

"I know what it is to live in a cottage with a deal floor and roof, and a hearth of mica slate; and I know it to be in many respects healthier and happier than living between a Turkey carpet and a gilded ceiling, beside a steel grate and a polished fender. I do not say that such things have not their place and propriety; but I say this, emphatically, that the tenth part of the expense which is sacrificed in domestic vanities, if not absolutely and meaninglessly lost in domestic discomforts and incumbrances, would, if collectively offered and wisely employed, build a marble church for every town in England; such a church as it should be a joy and a blessing ever to pass near in our daily ways and walks, as it would bring the light into the eyes to see from afar, lifting its fair height above the purple crowd of humble roofs."—JOHN RUSKIN.

### A Reasonable Appeal.

THE authors of the memorial to the Dean and Chapter of St. Paul's on the subject of the decorations have done a wise thing in thus bringing the matter directly to the attention of those responsible for the work. While the efforts of the objectors were confined to writing more or less vituperative letters to the newspapers, the Dean and Chapter had, perhaps, an excuse for the silence they have preserved throughout this controversy. Now they have no excuse. They can hardly ignore a direct appeal signed, amongst others, by the President of the Royal Academy. The appeal is made the more forcible by its dignified and moderate tone; the suggestion it makes is the eminently reasonable one that the opinions of experts appointed by the Royal Academy and the Royal Institute of British Architects should be taken on the specific question whether the red paint stencilling and the black lettering are a form of decoration likely to impair the chief architectural features of the structure as originally conceived and carried out by Sir Christopher Wren.

### An Irrelevant Reply.

THE Dean of St. Paul's has met this letter with two arguments, of which one is irrelevant, and the other is more in the nature of a repartee. Speaking at a dinner of the Salters' Company last Wednesday, Dean Gregory enlarged upon the immense improvements that have been made within the last thirty years in the services, the music, and the general management of the Cathedral. "Therefore," said the Dean, with indifferent logic, "if the Dean and Chapter have 'spoiled' the Cathedral, they have done so by converting a disgrace to the City and the country into a credit to both City and country, and into something of which the Church of England might well be proud." We are not aware that anyone has found fault with the present custodians of the Cathedral or their immediate predecessors for the successful efforts they have made to secure larger congregations, a more reverent demeanour on the part of visitors, a higher standard of pulpit eloquence, more beautiful music and more attention to cleanliness and order. Is it inconceivable that one may heartily approve of all these things, and yet object to red stencilling and black lettering?

### The Dean and "Punch."

THE Dean's reply to Mr. F. Cavenish-Bentinck, who forwarded the memorial, is a fairly smart example of the "retort courteous," but it avoids any attempt to meet the objections raised. "I can promise you and the memorialists," he writes, "that their memorial shall have the fullest consideration. It is satisfactory to find that such distinguished and wealthy men take an interest in St. Paul's—an interest, however, which none of them evinced when we have been collecting funds for raising St. Paul's from the discreditable condition in which it was allowed to remain for a long period of

years, and which was a disgrace to the metropolis." If the "distinguished and wealthy" ones felt crushed by this rejoinder, they no doubt revived a little on finding that "Mr. Punch" was on their side. That eminent commentator on men and affairs had a cartoon last week representing the shade of Sir Christopher Wren surveying in horror the work of the decorators of the dome, and remarking to Sir Wm. R-chm-nd, "Oh, Willie, Willie, how well could we have missed you."

### Turner at Guildhall.

THE loan exhibition of pictures which the Lord Mayor opened last week at the Guildhall is at least as notable as any of its predecessors. Some fine examples are to be seen of the works of Gainsborough, Reynolds, Constable, Wilkie, Morland, Etty, and other masters of the English school. But what gives special distinction to this exhibition is the magnificent collection of the works of J. M. W. Turner. Many of these pictures have never before been exhibited to the public, and the collection, as a whole, is beyond doubt the most comprehensive that has ever been got together. The skill which has been shown in the arrangement of the pictures adds not a little to their educational value. The arrangement is chronological, so that the student is enabled to trace the development of the painter's genius, as well as to compare his work with that of his contemporaries.

### An Art Gallery Wanted.

IN the course of his speech at the opening ceremony the Lord Mayor referred to the inadequate size of the Guildhall gallery, and said it was the hope of every member of the Corporation that before long the size of the gallery would be greatly enlarged. Though they could not hope to approach in magnitude to that grand building in Paris, the Louvre, yet it was not too much to look forward to their possessing one sufficiently capacious to be worthy of the City of London and of the ancient Guildhall. It is to be hoped that the Corporation will soon find a way to realise their desires in this matter, for it is certainly something of a reproach to the City of London that its art gallery should be inferior to that of many provincial cities. In any plans that are formulated it will be remembered, we hope, that what is required is not merely accommodation for the works of art at present in possession of the City. Once the gallery is built there is not likely to be any lack of lovers of Art who will give or bequeath some of their treasures to adorn its walls.

### An Architectural Outing.

THE architectural classes of the Glasgow and West of Scotland Technical College had their annual Easter visit to Beverley and Hull. The party left Queen Street on Saturday, the 1st inst., and returned on the Wednesday afternoon following. The principal object of the visit was to measure and sketch at Beverley Minster and St. Mary's Church, Beverley. Beverley Minster is the least known and the best of the three great minsters of Yorkshire, the others being at Ripon and York. The Early English work is perhaps the finest in the kingdom, and the richness of the decorated work is superb. In the choir is the famous Percy shrine, which is one of the most beautiful and elaborate mediæval monuments in the world. St. Mary's Church, at the north end of the town, is one of the largest parish churches in Yorkshire. It belongs to the Perpendicular period, and contains some interesting old leaded glass. Beverley is almost unique among English towns in having, for its size, two such large mediæval churches. A visit was paid to the interesting little church at Cottingham and the Holy Trinity Church at Hull. The amount of work done was a sufficient guarantee of the success of this holiday trip.

### Kilkenny Cathedral.

"EVERYTHING comes to those who wait" is an old saying, and seems to be specially applicable to the Roman Catholics and their recently completed Kilkenny Cathedral. The

building of this structure was started some fifty years ago, but has only just been finished. It was commenced under the supervision of Mr. Butler, architect, and completed by the late Mr. Hague. It has no steeple, but a particular feature is its wealth of mural decorations. It was originally intended to cost £40,000, but the baptistry and other adjuncts, including rich internal decorations, entailed an additional outlay of £20,000.

### Aberdeen and its Jerry-Builders.

THE jerry-builder, as we all know, does not confine his attentions to any one locality. There are few towns—or villages even—where his handiwork may not be seen. But there are certain places in particular where he seems to flourish like a green bay tree. Such a place, until the other day, was Aberdeen. But the Aberdonians have been aroused from their lethargy; they have held a public meeting, and seem determined that their city shall no longer be the happy hunting-ground (if the metaphor may be allowed) of the jerry-builder. Even the builders themselves have taken action against the baser members of their own trade. At the last monthly meeting of the Building Trades Federation we note that the following resolution was unanimously adopted:—"The Federation, recognising the fact that many buildings erected in the city are badly designed and of faulty construction, calls upon the Town Council, in the interests of public safety and comfort, and the amenities of the city, to take such action as may be deemed necessary to thoroughly supervise the erection of all buildings, and also to prevent new houses being occupied before they have been officially certified as being fit for habitation."

### St. George's Church, Liverpool.

THE discussion on the question whether the spire of St. George's Church, Liverpool, should be removed or not has induced "an Architect" to address the following letter to the "Liverpool Mercury." He says: "'To be, or not to be, that is the question.' Are we to have a really beautiful space on the site of the above by the removal of the entire church, or have it simply spoiled by allowing the tower and spire to occupy one corner, and practically ruin all? If all be removed, what possibilities present themselves of a handsome central clock tower of noble proportions, with waiting and refreshment rooms at its base, sunny terraces round, with pedestals for statuary, circular steps and sparkling cascades on alternate faces, with grass and flowers—a fitting use for the site of our old castle. If the old tower and spire be left as suggested, what then? Being up in a corner, they would look at their best a mere makeshift, an utterly unsuitable feature which, if it survived the disappointment of the citizens long enough, would appear to our children like a second-hand monument bought cheap, and not thought good enough to put in the centre of the ground. Let the Council stand firm, and not lose the opportunity of securing for the city such 'a thing of beauty' as it is possible to make St. George's Square, by having a clear space to deal with."

### Shakespeare's Church.

THE vicar of Stratford-on-Avon has issued a statement of the work of improvement that has been carried out in his church. On the anniversary day of Shakespeare's birth, a festival is kept in his native town, and it seems that at the time of the last festival the church in question was closed for repairs. It is now open in its renovated condition. The work done has included the entire remodelling of the organ, at a cost of £840; the introduction of new heating apparatus, and the relaying of the floor after filling in the old vaults, at a cost of £1,600; and the substitution for the old pews of carved oak benches in the aisles and chairs in the nave, at a cost of £576. Including architect's charges and sundry smaller improvements, the total outlay has been £3,450, and the subscriptions received have only amounted to

£1,831. This leaves the Restoration Committee to face a debt of more than £1,600. The vicar thinks that people may blame them for rashness in incurring this debt, but, in his opinion, few would have doubted that the British public would subscribe at least £4,000 for the renovation of Shakespeare's Church. The verdict of all who have seen the work done is favourable, and he hopes that before the festival day arrives the committee may be relieved of much of their anxiety. Any subscriptions he will be pleased to receive, or they may be paid to the Stratford-on-Avon Church Restoration Fund at the Metropolitan or Lloyd's Bank.

### Rural Fire Brigades.

WE heartily sympathise with the objects aimed at by the promoters of the Fire Brigade Bill, the second reading of which was moved in the House of Commons last Wednesday by Mr. Pym. There is no doubt that an enormous amount of property is lost in the country by fire, which might be saved if efficient means of fire extinction existed in every town and village. As Mr. Birrell, who seconded the motion, remarked, every year we witness the destruction of old buildings and mellow pictures, which no architect or artist now living could replace. The Bill aimed at making fire brigades throughout the country districts equal in efficiency to the Metropolitan Fire Brigade. Whether the methods proposed by the Bill for attaining that desirable end are the best possible is, perhaps, open to question. Mr. Chaplin thinks they are not; he objected to the extra work it was proposed to throw on the Local Government Board, and suggested that the Bill should be withdrawn and a select committee of enquiry appointed. Acting on this suggestion the promoters withdrew their Bill. We hope this does not mean that the matter has been shelved until some national calamity arouses our legislators to the importance of measures for protecting life and property from fire.

### Sites.

NEW Market Buildings are about to be erected at Leicester, and a correspondent has written to a local paper pointing out the unsuitability of the site. He thinks that an expensive and substantial erection, such as this will be, should have the best site possible, and be in a thoroughfare where it would be seen and admired, and pointed out to strangers as one of the sights of the town. Leicester is not the only town that is indifferent to the important matter of site. It seems to be a peculiarly English custom to build our great public buildings in back streets; witness our London Guildhall and Italian Opera House; and now it is intended—we believe—to erect the new Central Criminal Court upon its present site, than which it would be hardly possible to find a worse. The difficulty in London of finding appropriate sites for new buildings is, of course, very great; but though it may not be possible to find such a magnificent one as that of the Palais de Justice at Brussels, some more favourable position than the Old Bailey might surely be found, though possibly not within the limits of the City. The difficulty, however, is not so great in the case of provincial towns, and it should be the first care of local authorities, when new public buildings are put in hand, that they should be erected on the best available site.

### Fireproof Construction.

THE "Times" published an article, suggested by the recent disastrous fires in America, in which the necessity was pointed out for greater precautions being taken to render domestic buildings fire-resisting. This has led to some correspondence in which various reasons are suggested for the fact that in England so little attention is paid to this important matter. Mr. Maurice B. Adams, F.R.I.B.A., says the fault does not lie with the architect, but with the public who insist on having cheap buildings; although there are many admirable methods and materials available for fireproof construction, the architect cannot employ them because they involve a little extra expense. Another correspondent

would put the blame on the insurance companies, which make no distinction, he says, between buildings constructed on the most approved fire-resisting principles and the death-traps almost universally existing in our large cities. In this connection it is satisfactory to note from a reply given to a question in the House of Commons that it is proposed to make the new Government buildings in Whitehall, Parliament Street, South Kensington, and the Patent Office as far as possible fireproof; the architects, in conjunction with Sir John Taylor, will be instructed to consider what systems are the best to adopt.

### St. Michael Bassishaw.

THE Church of St. Michael Bassishaw occupies an isolated site between Basinghall Street and Aldermanbury, being approached from the latter thoroughfare through Three Nun Court. It is from the west end of this alley that our view is taken. The church is shortly to be pulled down; but, however one may regret its demolition, the consequences are not likely to be disastrous, for the church has been closed some years, and there is another less than 70 yards distant. The authorities intend to

DRAWN BY F. H. MANSFORD.

devote part of the money realised by the sale of the site to building a rectory for the now united parishes of St. Lawrence, Jewry; St. Mary Magdalen, Milk Street; and St. Michael Bassishaw. The cost recently incurred by the parishoners for the removal of the bodies from the vaults will be re-imbursed to them, and a new church will probably be erected in some fortunate suburb. The tower of St. Michael's is of brick (probably red) with stone dressings, but the brickwork has been for many years coated in cement. The lantern is of timber, covered with lead, and is much visited by pigeons from the neighbouring Guildhall. One or two curious points are noticeable about this comparatively simple tower. Its angles are not all right angles, and its sides are unequal, but the lantern is a true octagon. Possibly Wren built on the foundations of the fifteen century structure which was destroyed by the great fire. The parapet on the south side is treated differently from that on the other sides without any apparent reason; and the carved stone pineapples at the angles are of exaggerated height in order to appear in proper proportion as viewed from below. The church itself is of

little interest except for the carved pulpit and the monument to Dr. Thomas Wharton, a physician who braved the plague of 1665.

WE have already described the work done at the Testing Station of the British Fire Prevention Committee, but many of our readers, no doubt, will be glad to procure the fuller illustrated account of the station and its work, which is given in an attractively got-up pamphlet recently published (The British Fire Prevention Committee, 1, Waterloo Place, Pall Mall). The Committee undertake tests of any fireproofing material or construction that may be submitted to them, their charges—which are set forth in this pamphlet—being based on the actual cost of the tests. But in addition to these special tests they are engaged in investigating, as their funds permit, all kinds of ordinary building materials and forms of construction, and they hope in due course to be able to record the exact fire resistance of all the more common methods of construction used in the British Isles. Such a record, it almost goes without saying, will be of the highest practical value to architects and builders, and will indirectly benefit a much wider circle. For it is a lamentable thing that much valuable property, and even lives, should be lost every year for want of a little expenditure and a little forethought.

### German M.P.'s and Architects.

THE following interesting note appeared in a recent issue of the "Globe": "This country is plainly not the only one in which irresponsible criticism makes itself ridiculous by interference with the efforts of artistic experts, or by suggesting tasteless additions to buildings that have been the admiration of centuries. A quaint illustration of the same kind of captiousness is being provided now in Berlin, where a lively quarrel is in progress between the Reichstag and the architect and artists who are responsible for the decoration of the new Parliament building. So much ill-feeling has been aroused by the attack which the Building Committee has made upon the work in progress that the architect, Herr Paul Wallot, has resigned, and Herr Franz Stuck, an eminent painter, has refused to complete a painting which was to have been placed in the Chamber. A strongly-worded protest against the attitude taken up by the Reichstag has been signed by all the leading German artists."

### The Building Trades Exhibition.

WE are glad to learn that the International Building Trades Exhibition, to be held at the Royal Agricultural Hall, from April 26th to May 6th, promises to be the most comprehensive of its kind ever held in this country. The Exhibition will be opened at 12 noon on Wednesday next by Professor Aitchison, R.A. (President of the Royal Institute of British Architects), supported by the Duke of Westminster, K.G., Lord Welby, G.C.B. (Chairman London County Council), and many of the most eminent architects and engineers. Arrangements have been made for visits on different days from the following institutions: Institute of Surveyors, Architectural Association, Society of Architects, Institute of Builders, Municipal and County Engineers, Sanitary Inspectors. The ground floor space, we understand, is now entirely let, and applications can be received for gallery space only. The Electrical Section will be held in the Minor Hall, adjoining the main hall, and applications for the remaining space must be made at once. King Edward's Hall, leading from the arcade, and connecting with the main hall, will be utilised for the Smoke Abatement Section. The committee of the Coal Smoke Abatement Society (Sir W. Richmond, R.A., K.C.B., Chairman) offer gold, silver and bronze medals, together with Certificates of Merit for the best domestic appliances for abating the smoke nuisance. The design for the medal will be drawn by Sir W. Richmond, R.A. A full description of the exhibition, with illustrations of some of the more notable exhibits will be given in the next two issues of the BUILDERS' JOURNAL.

## HOUSING OF THE LABOURING CLASSES.\*

By P. FYFE.

IN order to give a clear notion of the housing problem as it is put before us in Glasgow, it will be necessary to consider at the outset the legal aspects, because over and beyond the dictates of sympathy and humanity stand the imperative demands of the law. It is now forty-seven years since the first of the Shaftesbury Acts was promulgated dealing with the proper lodging of the labouring classes. These were in turn succeeded in 1868 by the Torrens Acts for the provision of suitable houses for artisans, and in 1875 what is known as the Cross's Acts were passed as yielding legislative improvements in the same direction. All these led up to the Housing of the Working Classes Act of 1885, which in turn was almost entirely supplanted by the Act of 1890 bearing the same designation. This important act is divided into four divisions, and has seven schedules attached to it. The first and second divisions only need be considered, as they deal with the powers to be exercised by local authorities:—(1) over unhealthy areas; (2) unhealthy dwelling-houses.

### Insanitary Areas.

In Glasgow, Part I., dealing with unhealthy areas, has been a dead letter because, firstly, the "official representation" to the Local Authority must show that "the sanitary defects in such areas cannot be effectually remedied otherwise than by an improvement scheme for the re-arrangement and re-construction of the streets and houses within such areas, or of some of such streets or houses;" secondly, because the late police clerk, Mr. Lang, reported, *inter alia*, in 1895. "The legal process provided by this part of the act is tedious, circumlocutory, uncertain, and expensive;" and, thirdly, because the Corporation possess an Improvement Trust Committee, whose special function is to arrange and carry through large city improvement schemes when such become necessary, and this committee invariably proceeds by scheduling such areas and securing the necessary statutory powers for their reconstruction by means of a Local Act. Even the County Council of London, which has done much work under the Act, has only carried out three schemes under Part I., namely (a) that at Boundary Street, Bethnal Green, by which fifteen acres of narrow streets, courts and alleys were acquired and destroyed at a net cost to the ratepayers of £280,000; (b) The Clare Market Scheme of 1898, which cost £216,500; and (c) The Churchway, St. Pancras, Scheme, costing £39,150. The three schemes will displace 9843 persons from their houses. Glasgow has done nothing. We need not, therefore, occupy time discussing legal powers which in this city have had no practical result, either in unhousing or rehousing those of the labouring classes who dwell in insanitary areas.

### Insanitary Houses.

The case is different when we come to Part II. Under this part of the Act, which affects insanitary dwelling-houses and smaller areas than are pointed out under Part I., good useful work may be, and has been done. It should be noted that here the expression "dwelling-house" means "any inhabited building, and includes any yard, garden, outhouses, and appurtenances belonging thereto, or usually enjoyed therewith, and includes the site of the dwelling-house as so defined." The initiation of the procedure necessary under this part of the Act compares very favourably with that under Part I. Under the latter no one has the duty of making representations put upon him. The whole of the gigantic and costly machinery may lie rusting while the people are suffering, and blame can attach to no individual. The all important duty of setting its powers in motion does not lie with the Medical Officer

of Health until "two or more justices of the peace within the district or twelve ratepayers complain to him of the unhealthiness of any area." The lighter and less complex machinery of Part II., is, however, placed under the immediate care of the Medical Officer of Health, as the Act here distinctly states—"it shall be the duty of the Medical Officer of Health of every district to represent to the Local Authority of that district any dwelling-house which appears to him to be in a state so dangerous or injurious to health as to be unfit for human habitation." This is Section 30.

### Rights of Citizens.

The following Section (31) applies the spur to laggard duty, as under it any four householders dwelling near the street in which the insanitary dwelling-house is situated may, by writing to the medical officer, compel him to report to the local authority, and if nothing is done under the Act, these same householders, after waiting for three months, may legally petition the Local Government Board for an inquiry. It will thus be seen that every responsible citizen whose interests or amenities may be prejudiced by the proximity of any unwholesome and insanitary building which is inhabited, has distinct rights given to him by the Legislature. A little consideration will show the reasonableness of this provision.

### The Deterioration of House Property.

It seems to be one of the great laws of city growth that, in the closely packed area near the centre, decay, once started in a property, proceeds with alarming rapidity towards rottenness. Roofs, walls, windows, doors, and floors having served their day and generation, like the worn-out organs of aged humanity, refuse any longer to do their work—refuse to be patched up—and await dissolution. But, unlike the old and done man, there is no respite for the old property. On the contrary, the older it becomes the more work it gets to do. Whereas fifty or sixty years ago it sheltered the family of the merchant prince or well-to-do tradesmen, it has, by deterioration and unwise subdivision, to do the same duty for four or five families of the artisan. Time passes, and as the patchwork and repair of this reconstruction becomes worn and dilapidated, it falls in commercial value to the level which only the labourer and the casual worker can pay. A short time now brings it to its last and most degrading duty. Rotten in the ceilings and walls, open in the flooring, with rattling windows and tottering doors, it stands at last, neglected by owner and tenant alike, the uninhabitable dwelling-house—the haunt of poor unfortunates and the degraded—the home of the flotsam and jetsam of the city. Those who dwell or have business premises near it are now in danger. Ill health and evil manners are born and bred in it now. Both are contagious and tend to corrupt the surroundings, and consequently the Government has enacted that any four householders may protect themselves by written complaint to the medical officer of health, and so bring about the destruction of a property which, like the worn-out old horse, it is painful to see doing further labour.

### Obstructive Buildings.

There is another class of property regarding which the citizen has powers of initiative granted him under this part of the Act, viz., the obstructive building. Here, again, the four householders may make a similar representation, but this time not to the Medical Officer of Health, but to the local authority itself, which for this purpose means its Town or Police Clerk. Now, what is an obstructive building? The Act says any kind of building whatsoever which "stops ventilation, or otherwise makes or conduces to make such other buildings to be in a condition unfit for human habitation or injurious to health;" or, in the second place, if "it prevents proper measures from being carried into effect for remedying any nuisance injurious to health or other evils complained of in respect of such other buildings." It appears fairly clear that this most important part of the Act (Section 38) strikes at that

class of structures known in every city as back buildings, whether these buildings are used as dwelling-houses or stores or manufactories. It is of no avail to argue that former law, or want of law, permitted of their erection. Standing as they do on the natural court or back yard of the dwelling-houses in front, preventing air and light, and proper ground space for ashpits and conveniences, they stand condemned; but the loose law of former years and vested rights must here be recognised, and consequently, unless the obstructive building is itself unfit for human occupation, the owner of it may claim compensation under arbitration, which may fall to be paid by adjoining proprietors whose properties have been improved and increased in value by its demolition.

### Why the Act is not Applied.

I need hardly say there are many such obstructive buildings still in Glasgow. In only two cases has this part of the Act been applied here, namely, in Muirhead Street and St. Ninian Street, on the south side, and in neither case did the question of compensation arise, as both these back buildings were, in themselves, uninhabitable, and, moreover, belonged to the owners who held also the front properties. Otherwise this useful and powerful section has been untried. Perhaps the main cause is the difficulty as to the acquiring of the site upon which the obstructive building is built. If the owner of the building does not wish to retain the site, which it is unlikely he would wish to do unless he could erect another payable building on it, the burden of purchasing it falls *exclusively* on the local authority, who could only use it as an open space, and that without any power to claim compensation, therefore, as betterment against adjoining proprietors whose property would thereby be improved. The weakness in this part of the Act therefore forces Local Authorities into larger schemes of improvement, and impels them to endeavour to acquire both the back obstructive property and that one in front of it, rather than pay for a site, at the expense of the ratepayers generally, which would benefit but a small section of them, and most of all, the contiguous owners.

### Other Powers of Local Authorities.

True we have the following section, 39, which gives all Local Authorities power to acquire the whole of such areas, and appropriate them for the erection of dwellings for the working classes, but we need not occupy time discussing this very important section here, as Glasgow invariably prefers to proceed with a local bill for such purposes, rather than adopt the circumlocutory methods prescribed by the general Act. The London County Council and the Vestries have, however, proceeded in fifteen cases under Part II. of this Act, displacing 5,082 persons, and intend to provide new dwellings for 3,766 of those displaced at a total estimated cost of £222,323 18s. 5d.

### Rehousing the Unhoused.

We now come to a part of such schemes, the importance of which, in a large city, dare not be overlooked, viz.:—The rehousing of the labouring classes which have been, or should be, unhoused by schemes of demolition and improvement. This phase of the problem has become so acute that it formed, at the recent Sanitary Conferences in Dublin and Birmingham, the principal topic of discussion. Necessarily at such meetings, the discussions proceed in general and broad lines, but the extreme urgency of the matter in all large cities impels me to attempt to examine the whole subject in detail, and endeavour to lay down from experience, and from facts and figures kindly given me by several gentlemen of experience, a basis for guidance and future action.

### Practice of the L.C.C.

Part I. of the Act we have been considering makes it essential that houses be erected on or near the ground from which the people have been displaced. Part II., dealing with small areas, does not make provision for re-housing compulsory, but the London County Council

\* A paper read before the Glasgow Architectural Society.

Committee appointed to deal with this question passed at the end of last November two most important resolutions, which have since been adopted by the whole Council, viz.: (1) "That housing accommodation should be provided for a number of persons equal to that of the working classes displaced by any scheme under the Housing of the Working Classes Act, 1890, or under the provisions of any improvement act; but not necessarily in the immediate neighbourhood of the displacement, due consideration being given to the needs of those living on any particular area"; and (2) under Part III. of the Act, which gives them powers to buy land and build thereon for the purpose of increasing the supply of house accommodation, they recommend: "That apart from the rehousing required in connection with clearance or improvement schemes, the Council do approve of action being taken under Part III. of the Housing of the Working Classes Act (1890), with a view to the purchase of land and the erection of dwellings thereon for the purpose of supplying housing accommodation." This Committee also emphasise the necessity of building for the poorest classes, of building much cheaper structures than they hitherto have done, and point out that under Part III. their plans do not require to be submitted to any Government department, which invariably causes an unnecessarily high standard of work to be adopted.

#### Excessive Rents.

On examining the rents of the one and two-apartment houses they have already built, one is at once struck with the impossibility of the real labouring classes ever being able to pay them, and when I say the "real labouring classes," I mean those whose weekly earnings range from 17s. to 25s. Only in one block am I able to find any houses fitted for the means of such persons, viz., that in Dufferin Street, where a one-apartment house ranges from 2s. to 2s. 9d. per week, and a two-apartment house from 4s. to 4s. 6d. a week, and of these there are only twenty-nine of the former and twenty-three of the latter. In all their other blocks the rents range from 3s. 6d. to 5s. a week for each single apartment house, and from 4s. 6d. to 8s. per week for two-apartment houses. These are impossible rents for the great mass of our labourers and poorer classes generally, and I am happy to say we can show a better record than this in Glasgow. It might be said in passing that through the courtesy of the secretaries and managers of various dwelling companies in London, I have been favoured with much information as to the rents these companies charge for their houses, but only in the case of buildings erected under the Peabody Donation Fund can I find single-roomed houses rented as low as 2s. to 2s. 3d. weekly, and two-roomed houses at 3s. 3d. to 3s. 6d. weekly, the latter, though low, being, in my judgment, more than a labouring man or a poor person in Glasgow can conveniently pay for house accommodation. All these other companies are, of course, based upon the plan of returning a full compensation to the capitalist, while providing houses yielding increased comfort and convenience for the labouring classes, and hence it may, from experience, be almost accepted as an axiom that where "full profits" are demanded by the capitalist on the money he lends for the proper housing of the labourer, the labourer must pay a rent out of due proportion to his average income. By the words "full profit" I mean any rate of interest above 4 per cent.

(To be continued.)

**Collapse of a Building.**—Two men were killed at Wellington Mill, Preston, owing to the collapse of the cotton room. At the inquest a verdict of accidental death was returned, the coroner remarking that there seemed to be a consensus of opinion that the collapse was not due to the removal of the old boiler. It was rather remarkable that the men received the first warning of the disaster from the very place where was situated the rotten beam.

## Professional Practice.

**Bradford.**—The restoration of Bradford Parish Church is now practically complete, and it was opened last Wednesday for public worship. The old galleries in the north and south aisles have been removed, and transepts have been erected so as to afford additional floor space. The building of commodious vestries to the north-east of the church will render it possible to restore the Bolling Chapel, which has been used since 1864 as a clergy vestry. The corresponding chapel on the north side of the chancel, known as the Leventhorpe Chapel, will continue to be used as an organ chamber. The chancel, which was previously laid with tiles, has been paved with marble, which has been laid on concrete. It is strange to note that when the tiles were removed it was found that they were based upon a large number of gravestones. The roof of the chancel has been re-slatted. In the nave, panels of light-coloured oak, instead of lath and plaster, have been inserted, and serve to emphasise the shape of the beams, and decoration of the old black oak roof which the church possesses. The aisle roofs on both sides of the church are now entirely new. The old ones were originally laid, in the fifteenth century, on a somewhat flat pitch, and were slated, but apparently they did not sufficiently well turn rain, and at some subsequent date the same timbers were used to rebuild the roof at a steeper pitch, the additional height being obtained by cutting off nearly a foot of the clear-storey windows. The new roofs follow the original low pitch, and are covered with lead. Several new memorial windows have been given to the church, and a very fine one has been erected by Messrs. Shrigley and Hunt, of Doncaster. It is intended to put glass mosaics into the panels, at present blank, of the reredos, and the work will be carried out by Messrs. Powell and Son, of Whitefriars, London. The pulpit has been enlarged by the insertion of niches at the corners, which will contain figures of Evangelists. The sum of £100 has been expended in the erection of a handsome screen at the west door, which will cut off a portion of the tower to serve as an entrance lobby. The church is to be lighted by means of electricity. The whole of the work has been carried out from the designs of Messrs. T. H. and F. Healey, architects, of Bradford.

**Bristol.**—A new building which has been erected by the Bristol School Board on the Broad Weir and partially in Castle Green for a Pupil Teachers' Centre in Bristol, was opened last Thursday. The building has been erected at a cost of £4,400, from the designs of the architects, Messrs. La Trobe and Westen. It is in the Renaissance style, and is carried out in terra cotta and red bricks. The chief elevation is on the Broad Weir, but entrances have been provided on both sides, and these give access to a wide fire-proof and well-lighted staircase, arranged with dados of glazed bricks. An arcading is carried up with pilasters with Ionic caps on the Broad Weir elevation, there being half-a-dozen lights on the lower and upper floors. The science and art rooms are situated at the top of the building, with a clear uninterrupted north light. Two octagonal turrets with pinnacles that reach an altitude of 70ft. from the level of the Broad Weir flank a centre gable above the arcading. On the ground floor beneath the arcading the space is occupied by the Science demonstrator's room, 44ft. long, and the front is faced with blue pennant ashlar. There is a large assembly hall, to seat 300 persons, on the Castle Green level, 56ft. by 30ft., and 17ft. high, and it is intended to use this hall for examinations and other purposes. There are six large class rooms, each about 25ft. square, in addition to masters' and mistresses' rooms, cloak rooms and lavatories for students, besides separate rooms for science and for art students, and a residence for caretaker, also a students' dining room. All the floors are of maple, the landings next the areas are inclosed by orna-

mental iron grilles, and the area for light and the class rooms and offices are faced with white bricks and tiles. The heating and ventilating have been carried out by Messrs. Skinner, Board, and Co., Rupert Street, Bristol, on the low-pressure system, the rooms being fitted with ventilating radiators, by which means the fresh air is warmed before entering the building. The general contractors have been Messrs. Hughes and Weeks, of St. Philip's.

**Cardiff.**—The memorial stones of the Presbyterian Church in Roath Park, Cardiff, were laid last Wednesday. The church stands on a site at the junction of Penylan-road and Marlborough-road, and facing the entrance to Roath Park. The church consists of nave, with transepts and chancel, with porches and a commodious vestibule. The internal length is 125ft., the width of nave 47ft., and in transepts 62ft. There will be an open timber roof of ornamental design in pitch pine, the height being 42ft. The chief external feature will be the tower and spire 150ft. high. The central doorway is a copy of Tintern Abbey doorway, while the five light-traceried window above recalls the south transept window of Melrose Abbey. The church is designed in the decorated style of Gothic, and is being built of Newbridge polled stone, with bathstone dressings. It will accommodate between 800 and 900 persons. The choir and organ will be raised above the level of the nave. The organ will be built by Messrs. Harrison and Harrison, Durham, at a cost of £1,083. At the rear of the church there is provided a suite of rooms comprising vestry, session room, manager's room, and choir room. The architects are Messrs. Habershon, Fawcner, and Groves, of Newport and Cardiff, and the contractor is Mr. James Allan, of Cardiff. The cost of the church, including organ and furnishing, will be between £9,000 and £10,000.

**Edinburgh.**—Some time ago, the Midlothian County Council resolved to reconstruct the Edinburgh County Buildings, and in following up this resolution, they have now invited architects to submit competitive designs for the new buildings. They offer two premiums, the first of £100, and the second of £50; and it is stated that if from any cause the buildings are not proceeded with, and no drawings other than the competitive drawings have been prepared, the selected architect shall receive a payment of £200 in settlement of all claims. It is likewise stated that any design which is estimated to cost more than £40,000 may be disqualified. The available site specified embraces Liberton's Wyne. In regard to the Ionic portico, which is a conspicuous feature of the Parliament Square elevation of the present building, competing architects are expressly asked to consider whether it is desirable to retain it in its present position, or in any other position in connection with the new building; and while the Council are entitled to build up to the limits of their ground, competitors who consider it desirable to remove the portico are requested to have regard to the general amenity of Parliament Square in the building line which they may adopt for the east front of the new building. In the statement of accommodation required, mention is made of a Council Chamber for forty-one members, two committee rooms, and a County Councillors' writing-room; offices for the different county officials and their assistants, and for the headquarters' staff of the county police; a public office for the collection of rates, and a Justice of the Peace Court-room, with a floor area of 1250 square feet approximately. It is suggested that the Justice of the Peace Court and offices might be placed on the southern part of the site, and in a building of less height than the other parts of the structure, so as to interfere as little as possible with the windows in the west end of the Signet Library. The designs are to be lodged with the County Clerk by June 27th.

**Leeds.**—A new dead meat market is being erected at a cost of £30,000. The chief entrance to the market exactly faces St. James's Hall, and there are thirteen entrance s

(one to each exterior shop) from New York Street. Between the two rows of shops an avenue, 12ft. wide, extends the full length of the building (200ft.) At the far end twelve offices are situated, six at each end of the pitch-pine balcony, approached by a spiral staircase. A caretakers' house is being provided at the principal entrance, and over it a clock-tower will be built to a height of some 70ft. The architects are Messrs. W. Hanstock and Son. The cost of £30,000 is inclusive of the abattoir. A covered wood-paved avenue separates the two structures, and a gangway, with a gradient of 1 in 5, will accommodate the cattle in their ascent to the lairs prior to slaughter.

**Newport, Yorks.**—A new church has been erected at Newport, Yorks, at a cost of about £7000, from a design by Mr. T. S. Brodrick, architect, of Hull. It stands on the western

**South Shields.**—The Union offices at South Shields, of which an illustration is here given, contain accommodation for the officials of the Guardians, consisting of board room, committee rooms, clerk's offices, and relief station, with rate collector's rooms on the first floor. The architect is Mr. J. H. Morton, F.R.I.B.A., of South Shields.

**Stanningley.**—A new school has been erected by the Pudsey School Board at Primrose Hill, Stanningley, from the designs, and under the superintendence of Mr. E. P. Peterson, architect, Bradford. It is built on the central hall principle for 389 boys and girls. There are three class-rooms on the north, and three on the east side of the central hall. The south side is occupied by spacious cloak-rooms, lavatories, and entrance halls—separate for boys and girls. The west side is reserved for future enlargement. There

UNION OFFICES, SOUTH SHIELDS. J. H. MORTON, F.R.I.B.A., ARCHITECT.

boundary of the parish of Wallingfen, and consists of a chancel, nave (with north and south aisles), two transepts, and a western tower, surmounted by a short steeple. The sloping roofs are of red Staffordshire tiles. The nave is pierced by four clerestory windows on each side, and the aisles are divided into three bays with three lights in each aisle, and terminated at the western end by a vestry. The nave is separated from the aisles by arches springing from capitals on circular pillars. The chancel is fitted with oak stalls, carved by Mr. Elwell, of Beverley, and the pulpit and altar table are of carved oak, from designs by the architect. A feature of the decoration of the church is the east window, the five lights of which are filled with stained glass of artistic design representing Scriptural scenes, the centre light depicting the Crucifixion. This window has been executed by Messrs. Clayton and Bell, of London. The contractor was Mr. F. Pattinson, of Rushington, Lincolnshire, and Messrs. Kelsey and Sons, of Goole, constructed the building.

**Rotherham.**—The new Corporation Swimming Bath, in Market Street, was opened recently. The bath has cost about £5000, and is the largest in the district, measuring about 26 yards by 12 yards, with a depth of 5ft. 8in. to 3ft. 8in. There are fifty conveniently arranged dressing boxes. The plans were prepared by Mr. W. Eckersley, a local engineer; and Mr. Richard Snell, of Rotherham, has been the contractor for the building; Mr. Johnson, of Tinsley, has supplied the tubes and girders; and Messrs. Newton, Chamber, and Co., Limited, of Thorncliffe, have been responsible for the ironwork of the roof.

is a full-sized playground on the Richardshaw Lane side of the building with playshed, &c., for boys, and on the lower side of the building there is also a playground and playshed for girls. The total cost, including site, playground, fencing, fittings, and furniture, is about £5,000. The school was opened on April 10th.

**A Munificent Gift** has been made to the Nottingham General Hospital. At a meeting of the monthly board a letter was read from Mr. John Robinson, J.P., of Worksop Manor, offering £10,000 for the purpose of building a new wing to the hospital. This offer was at once accepted.

**A Stained-glass Window** has been put up in the south aisle of St. Cuthbert's Church, Edinburgh. It contains illustrations from the life of St. John, and a representation of John and Mary returning from the Crucifixion. The artists who have executed the work are Messrs. A. Ballantine and Gardiner.

**Kensington Palace**, of which we gave an illustration last week, has been undergoing a process of restoration and renovation during the past year in view of its being thrown open to the public this summer. The old woodwork has been restored, the girders have been strengthened, and the place has been generally redecorated.

**New Technical College for Wigan.**—The Building Committee of the proposed College have decided to accept the design by Messrs. Briggs and Wolstenholme, architects, of Blackburn, which was submitted for competition. The structure will be in the Victorian style, in pressed bricks and terracotta, and will cost about £20,000.

## "THE SCOTSMAN'S" NEW BUILDINGS IN EDINBURGH.

**T**HE plans of the new buildings in Edinburgh, to be erected on the west side of North Bridge Street and south side of Market Street, by the proprietors of "The Scotsman," were passed at a recent meeting of the Town Council. The architects are Messrs. Dunn and Findlay, of Frederick Street, Edinburgh. The north elevation looking towards Princes Street has a frontage of 130ft., the whole frontage, including the buildings erected on the Old Fishmarket, being over 250ft. From the railway level to the highest point of the central pediment of the gable next the bridge the building is 190ft. in height. From the railway to Market Street is about 30ft., from Market Street to North Bridge Street 50ft. more, and the rest of the height, 110ft., is above that level. The style of architecture adopted is a free treatment of Renaissance, with French chateau features. The outstanding features on the northern elevation are two gables, the higher to the east, the lower to the west—both treated in a decorative fashion. They are joined together by a lower building. The eastmost gable has a breadth of 54ft. Prominent architectural adornments relating to it are octagonal turrets or tourelles, which, starting from the level of the second floor above the bridge, are carried up to a height of about 100ft., and are finished on top with circular stone domes surmounted by sculptured figures. The octagon is brought into the circle by means of corbelled work and angular rusticated pillars with entablatures. Between the towers is a triangular pedimented gable rising above the domes about 25ft.

The lower part of the basement immediately above the North Bridge is treated with strongly-rusticated ashlar work, pierced by three circular-headed windows. The windows over these are deeply recessed with architraves and intervening coigns. From this base there rises a row of four Ionic columns, running through the height of two storeys, with bases, capitals, and entablature. The cornice above the columns, with its plain modillions or brackets, is treated as the main cornice of the building. In the centre of the floor above rise pilasters with ornamental trusses carrying shafts which support the main ogee-shaped pediment of this gable. Over this pediment will rise a group of sculptured figures.

The west gable has a breadth of over 50ft. Its height above the railway level is 180ft.; above Market Street it is 150ft. At the angles are circular tourelles running up from the third storey above Market Street to a height of 70ft. The three-light windows with which these tourelles are pierced on every floor have architraves and coigns with carved frieze and cornice. Between these tourelles, and rising through four storeys of the building, is a series of four light oriel windows. The central portion of the gable is broken up by means of pilasters and a broad sculptured frieze, ornamental crow steps, and finials. The west gable projects 35ft. in front of the Market Street line of the east gable, and 45ft. in front of its North Bridge Street line. Entering from the North Bridge Street level is a terrace 10ft. wide. Below the level of the terrace to Market Street, the front of both gables is treated as a basement pierced by circular-headed windows. In the lower building between the east and west gables will be placed an inner staircase giving access mainly to the upper floors of the west building.

Further west, on the site of the old Fish Market, and separated from "The Scotsman" building proper by a low screen, in which is the entrance to the Flesh Market Close, is a building seven stories in height. By agreement with the Town Council "The Scotsman" proprietors, when they purchased this site, were bound to erect a new building upon it which would cost at least £15,000. The design shows a building, the cost of which will be about £50,000. It is designed in a style to harmonise with the pile to the east of it. Its frontage to Market Street is 100ft., and it rises to a height above that thorough-

fare of 110ft. at the ridge of the roof. On the street floor the arcade is 15ft. in height. At the height of 80ft. from Market Street there is a wall head cornice with ornamental modillions, rising over which are five dormer windows with side pilasters. Between the dormers is a pierced balustrade. This building has a straight sky line. Between the railway level and Market Street there is a height of 30ft. In connection with the erection of "The Scotsman" buildings, it has been arranged that the retaining wall on the railway side is to be removed along the length of the Market Street frontage; that this section of the street will be carried on concrete arches and steel pillars strong enough to bear a great weight, and that a railway tunnel entering from the North British Railway system shall be constructed underneath the street.

The north block, which has a frontage of 125ft., rises to about 100ft. above the street level. The central building of the North Bridge Street frontage is divided vertically through three stories into three compartments by means of pilasters and elliptical arches. Above the main wall head the building takes the form of a high pitched gable which is carried upwards with a variety of curved and straight lines, with obelisks intervening, until it terminates in a gablet with rusticated shafts, sculptured panel, pediment, and finial. The side wings balance each other, and are treated to harmonise with the main block. Dormers rise over the wall head and these are surmounted by gablets. The most northerly building has a frontage to the street of 60ft. The whole of the lower floor will be devoted to a hall, 53ft. by 43ft. by 26ft. in height, with a gallery carried round it on the first floor level. Above the central doorway rises through three flats a curved projecting gable, framed with rusticated pilasters, showing two-light windows, divided at the floor stages by sculptured panels, and finishing on top with a triangular pediment inclosing a carved tympanum.

The High Street corner block has a frontage to North Bridge Street of over 50ft. It has features in common with the rest of the elevation. The buildings to Cockburn Street will have Scottish features corresponding to the style of architecture of that thoroughfare; but the designs for these have not yet taken shape. The street level of the North Bridge Street elevation shows a range of shops with saloons behind and cellars below. The constructional feature of the whole of the pile will be that from basement to attics they will be carried on steel pillars and girders, so that partitions dividing up the internal floor space can be placed anywhere as may be required.

The cost of excavating the site of "The Scotsman" building proper was £6,000. This was done by Messrs. Waddell and Sons. This firm also secured the contract for taking down the old buildings and putting in the concrete foundations. The price was £14,000. The first contract for the buildings from Market Street to the North Bridge Street level, the public stair, and the tunnel, has been let to Messrs. William Beattie and Sons, the price being £30,000. This is exclusive of steel work, the contract for which has gone to Messrs. Redpath, Brown and Co. It is estimated that the total cost of the buildings, including the site, will exceed £300,000.

**A new Bridge over the Derwent.**—It is proposed to erect a bridge over the river Derwent, about three miles below Malton, at a cost of £1,200.

**Electricity at Bangor.**—The first installation of the electric light in Bangor and district, was switched on at Port Penrhyn Slateworks last week.

**An Agricultural Hall for Glasgow**—An agricultural hall is to be erected at Scotstown, which is about seven miles from Glasgow, at a probable cost of £70,000.

**The West of England Eye Infirmary** is now in course of re-erection. It will cost about £8,500, and will provide for the accommodation of eighty-five patients.

## Keystones.

**A new Catholic chapel** was opened last week at Aylsham.

**A Chinese Educational Institute** is proposed to be erected at Peking.

**Inverness Cross.**—An undertaking is on foot to restore the old Inverness Cross.

**An Electric Light Station** is to be erected at Lowestoft from plans by Mr. Hawtayne.

**A new Post Office** has been opened at Welshpool. It is situated in Broad Street.

**The Gladstone Statue** to be set up at Westminster is to be executed by Mr. Hamo Thorneycroft, R.A.

**A Primitive Methodist Chapel** has been erected at Skegness at a cost of £1,850, and was opened last Thursday.

**A swing bridge** is to be built across the River Avon (Bristol), to connect Hotwells and the Ashton Gate district.

**The Great Central Railway Company** have opened their depôts throughout their new extension line to London.

**Devonport National School.**—A girls' department of St. John's, Devonport, National School was opened last week.

**A Highly Placed Clock.**—The new clock in the tower of the Philadelphia City Hall is 370ft. above the pavement. It has cost 21,000 dollars, and is worked by means of compressed air.

**Glenbucket Public Hall.**—The foundation-stone of this hall was laid recently. The building is estimated to cost £300, and will be erected partly of freestone and partly of granite.

**A new Drill Hall at Ormskirk** is in course of erection. The cost of the building will be about £2,000, and it is being constructed from plans by Mr. H. Rimmer, architect.

**The Reconstruction of Holy Trinity Church Tower**, at Long Melford, is estimated to cost about £5,000. The corner stone was laid on the 10th inst., and when the tower is completed it will be 118ft. high.

**Llanarmon Memorial Column.**—A column has been erected in the village of Llanarmon, to the memory of Mr. John Parry, an anti-tithes and land reformer. It is of red Aberdeen granite, and 17ft. high.

**A new Hospital for Glasgow** was recommended by a majority at a meeting of the House Committee of the Glasgow Parish Council. It is expected to involve an expenditure of over £200,000, and will accommodate 1200 patients.

**New Baptist Chapel at New Tredegar.**—A new Baptist Chapel is to be erected at New Tredegar at a cost of about £2,000. It is to be built of native stone, with ornamental dressings of red brick, and the site will be in the main road leading to Elliot Town.

**Public Improvements at Gainsborough.**—In connection with the improvement of Gainsborough streets, the Urban District Council discussed an offer from Mr. Barnes to dispose of his property at £2,000, for widening Church Street, and refused to entertain the offer.

**Midford Castle, near Bath**, was built about 200 years ago. It is of singular construction, being in the form of the ace of clubs, the angles being rounded off and embattled. A gambler is said to have built the mansion with the proceeds of a night's gambling, and had it built in this peculiar style because his run of luck resulted from backing the club suit.

**The Society of Antiquaries**, of Scotland, held their monthly meeting last week. A paper was read describing a crannog, recently discovered at Hyndford, near Lanark, and one at Lochan Dughail, Argyllshire. Another paper, by Mr. T. Ross, architect, described a series of six paintings of the Sibyls, found on a wooden partition in taking down the House of Wester Livlands, near Stirling.

## Architectural Students' Spring Visit.

The spring holiday visit of the students attending the Architecture and Building Construction Classes of the Glasgow and West of Scotland Technical College took place on Monday, last week, to Motherwell and Hamilton. The party numbered about forty, Mr. A. Cullen, F.R.I.B.A., acted as guide, and many buildings were visited.

**An Electric Light Map** of the United States railway system will be an interesting feature of the Paris Exhibition. This map will be 137ft. high and 225ft. long, and every line will be marked out with electric lights. From time to time the position of a number of express trains will be shown on the map by means of moving electric lights.

**The Renovation of Leeds Church Institute** has been carried out at a cost of over £2,000. The improvements consist of an installation of the electric light, new heating apparatus, the provision of a smokeroom on the ground floor, the addition of a ladies' retiring room, a suite of lavatories, and an extra room to seat fifty persons. The apartment known as the council room upstairs has been enlarged so that it will seat about 150 persons. The entire premises have been redecorated.

**A Policeman Artist.**—Police-constable Jones, of Leeds, has succeeded in getting one of his pictures accepted for the Royal Academy. The artist is thirty years of age and a native of Shrewsbury. He has been nearly ten years in the force, and was injured during the Hull dock strike in 1893. He is a self-taught artist, and took to painting on receiving his injury at Hull. He pursues his studies while engaged in looking after committee rooms. Mr. Jones has exhibited pictures at Leeds, York, and Manchester.

**The new Friars' School.**—The memorial-stone of this new school at Bangor was laid last Wednesday. The building is in Elizabethan style on simple lines, with mullioned windows. The walling is of Llysfaen stone, with red sandstone dressings. On the south front is the principal entrance, to the right of it being the dining hall and assistant masters' rooms, while class-rooms are on the left. Above the class-rooms is the assembly hall, a room 58ft. long; the dormitories are placed over the dining room.

**"The Thermostat"** is a modest little eight-page sheet designed to disseminate such information as shall lessen the frequency of fires, and when they do take place—let everyone know how best they are extinguished. The first number is bright, interesting and readable throughout. Its promoters probably do not look for "the largest circulation in the world," but in pursuit of their definite and very useful aim, they ought not to lack a fair measure of support. "The Thermostat" is published monthly, price 1d., by Edgar Norman Duffield, 32, Beech Street, London, E.C.

**The Bristol Society of Architects and Surveyors.**—The annual meeting was held at the School of Art on April 11th, Mr. R. W. Fowler in the chair. The treasurer's statement of accounts, which showed a balance in hand of over £124, and the annual report, which dealt chiefly with technical matters, were adopted. The total membership is 116. The following were elected officers and council for the year 1899-1900: President, Mr. J. Smith; vice-president, Mr. A. Smith Denton; hon. treasurer, Mr. F. Fowler; hon. secretary, Mr. W. C. Fenton; council, the above and Messrs. E. M. Gibbs, C. Hadfield, C. J. Innocent, T. Winder, J. B. Mitchell Withers, and J. R. Wigfull.

## THE CARBONISATION OF WOOD.

WOOD, as a combustible, is divisible into two classes—first, the hard, compact, and comparatively heavy descriptions, such as oak, beech, elm, and ash; and, secondly, the light coloured, soft, and comparatively light woods, such as pine, birch, and poplar. In France, firewood is classed as fresh wood (*bois neuf*) and peeled wood (*bois pelard*), or oak stripped of its bark. According to M. Leploy, green wood, when cut down, contains about 45 per cent. of its weight of moisture. In the forests of Central Europe, wood cut down in the winter contains, even at the end of the following summer, more than 40 per cent. of water. If kept for several years in a dry place, wood retains from 15 to 20 per cent. of water, and even after it has been thoroughly desiccated, it will, when exposed to air under ordinary circumstances, absorb 5 per cent. of water in the first three days, and will continue to absorb moisture until it contains, say, from 14 to 16 per cent. The amount fluctuates above and below this standard, according to the state of the atmosphere.

M. Violette found that by exposing green wood to a temperature of 212deg. Fahr. it lost 45 per cent. of its weight, which accords with the observation of M. Leploy. He further found that by exposing small prisms of wood, half an inch square and 8 in. long, cut out of billets that had been stored for two years, to the action of superheated steam for two hours, they lost from 15 to 45 per cent. of their weight, according to the temperature of the steam, which varied from 257deg. Fahr., to 437deg. Fahr. The hardest woods lost more weight than the softer ones. At a temperature of 392deg. Fahr., wood becomes visibly altered, and the decomposition may, perhaps, commence at a lower temperature. It may be that the loss of weight is not entirely due to a reduction of hygrometric water. A higher temperature than 212deg. Fahr. appears to be necessary to disengage all the water.

Ordinary firewood contains, by analysis, from 27 to 80 per cent. of hygrometric moisture. M. Chevandier, in 1844, published the analysis of five woods, beech, oak, birch, poplar and willow. The woods were reduced to powder, and desiccated at a temperature of 284deg. Fahr., before being submitted to analysis. The results show that the composition of woods is practically as follows:—Carbon 50 per cent., hydrogen 6 per cent., oxygen 41 per cent., nitrogen 1 per cent., and ash 2 per cent., a total of 100, thus proving that there is only 56 per cent. of combustible matter, but that there is a large quantity of oxygen, nearly enough to neutralise the whole of the hydrogen, and that there is only a small quantity of ash. The above mentioned analysis is corroborated by the experiments of M. Violette, who desiccated the wood at a temperature of 176deg. Fahr. He found that the composition of the wood is about the same throughout the tree and bark; that the wood and the bark have almost the same proportion of carbon (49 per cent.), but that the bark has more ash than the wood. When wood contains 25 per cent. of water, there is only 75 per cent., or  $\frac{3}{4}$  lb. of wood substance in 1 lb., and the total heat of combustion is 75 per cent. of 7792 units, or 5844 units, which is only 41 per cent. of that of average coal. Similarly the equivalent power is reduced to  $\frac{3}{4}$  of 605 lb. of water at 212deg., of which the equivalent of a  $\frac{1}{4}$  lb. is appropriate to the vaporising of the contained moisture. For 1 lb. of dry wood the products are 13 cubic feet of gaseous products. M. Violette, in his experiments on the carbonisation of black elder wood, formed it into prisms 24 in. long and 0.4 in. diameter, made up in sets of twenty. Each set was dried separately at a temperature of 300deg. in a current of superheated steam, to which it was subjected during two hours.

The carbonisation was effected by the same medium, at least, up to 660deg. Fahr., and in crucibles placed in a furnace at higher temperatures. The degree of heat in the furnace was checked by the melting of small pieces of various metals, placed in the crucible

along with the samples. From the results it appears that charcoal, properly so called, is not formed until a temperature of 536deg. Fahr. is reached. From 536deg. to 644deg. Fahr. brown charcoal (from 36 to 31 $\frac{1}{2}$  per cent.) is formed. Beyond 644deg. Fahr. the charcoal is black, and the yield decreases with the increase of temperature, until, at the unknown temperature of melting platinum, it becomes just 15 per cent. of the weight of the dried wood from which it is produced. Brown charcoal is flexible, unctuous, and soft to the touch; while black charcoal is rigid, brittle, and harsh to the touch. According to Mr. Sauvage, the charcoal manufactured in French forests is composed as follows: Carbon 79 per cent., free hydrogen 2 per cent., hydrogen, oxygen, and nitrogen 11 per cent., and ash 8 per cent.—total 100. W. N. B.

## Under Discussion.

### MINOR POINTS IN PRACTICE.

At the meeting of the Edinburgh Architectural Society, on the 12th inst., Mr. J. Fairweather, of Glasgow, who represented the E.A.A., delivered a most useful and interesting paper on "Minor Points in Practice." Mr. Alfred Greig, vice-president, occupied the chair. The lecturer, as it were, laid his most private notebook before the audience as he gave his opinion on a variety of those little matters on which the success of a job ultimately depends. After some wise advice on the management of clients, all manner of materials and constructions were in turn taken up and contrasted from the points of view of efficiency and economy. The case between hollow and solid walls was carefully discussed, and the lecturer gave his verdict in favour of solid stone walls where such could be had. Many modern constructions and dodges were referred to, and the value of the paper was enhanced by the severely practical basis of all the criticisms, founded as they were on personal experience. A very hearty vote of thanks to the lecturer concluded the meeting.

### SHOP FRONTS.

The usual meeting of the Glasgow and West of Scotland Technical College Architectural Craftsmen's Society, was held at the rooms on Friday evening, the 7th inst., Mr. R. W. Horn, A.R.I.B.A., occupying the chair. A paper was read by Mr. Jas. Lochead, A.R.I.B.A., on "Shop Fronts, Past and Present." The author showed what an important branch of architecture shop-building is—how essentially modern—and he illustrated by limelight views the evolutions of the shop front from the fifteenth century up till the present day—from the old-fashioned "Rows and bulk shops," to the modern plate glass and colonnaded recessed fronts. He expressed the opinion that 8 ft. above the pavement was sufficient for the display of goods in the average shop window, and pointed out how the space above lent itself to architectural treatment. The average shop front was also criticised, and improvements were suggested. A very good selection of views of shop fronts, particularly local ones, was shown, and served to illustrate the author's remarks. A hearty vote of thanks was awarded Mr. Lochead for his very practical and interesting paper.

### MACHINE TOOLS.

At a meeting of the Society of Engineers, held at the Royal United Service Institution, Whitehall, on April 10th, 1899, Mr. John C. Fell, President, in the chair, a paper was read on "Machine Tools" by Mr. Ewart C. Amos, M.I.Mech.E. In his opening remarks the author pointed out the importance of engineers being well acquainted with the most modern practice in regard to the construction of machine tools. He further added that, owing to the important part in the world now played by machinery, the progress of this country in relation to others would be largely determined by its capacity to turn out the best and most improved tools. The author

then referred to the distinctive features of modern tools, directing particular attention to the fact that it had now become the practice to substitute for one machine doing a great variety of work a number of machines, each dealing with one class of article. Modern practice also called for greater accuracy and more automatic machinery. He observed that ball thrust, hollow spindles, cut toothed gear, and other refinements had now become very general, and resulted in the production of better work at less cost. He then divided his subject under a series of headings, which included, amongst others, lathes, drilling, boring, milling, planing, shaping, slotting, keyway-cutting, punching, and shearing, plate bending, metal sawing, and forging and welding machines. The author devoted considerable space to a description of various forms of capstan lathes with wire feeds and chasing apparatus, pointing out what an important tool this has become. Of drilling machines several useful types were described and illustrated, including a semi-radial drill of American design, which is of entirely novel construction. His reference to milling machines indicated the importance he attached to this class of tool, which is now in so much demand in all well-appointed shops, and is made in such a variety of shapes. The author then described several hydraulic power machines, and under another heading gave a description of a class of tool now coming very much to the front, viz., the pneumatic. Some useful information was given as to their advantages and economy. Some figures and data given in this connection showed that in drilling, four times as much could be done as compared with hand drilling, and that they effected a saving of some £50 to £75 per annum per tool, even in a comparatively small drill. Under the British v. American heading the author closely compared the two makes; and whilst he said he felt bound to give considerable credit to American manufacturers for their ingenious and well thought out designs and well finished machines, he also considered that the home products would probably excel them if our manufacturers could see their way to discard some of their old patterns. He concluded this section by pointing out that, although our markets were already encroached upon by the American makers, yet the prospect of a largely increased demand for machinery in the near future would tend to provide business for makers of both countries, securing at the same time a healthy competition. Under the title of cheap v. good tools, the author expressed himself very strongly in favour of good tools, and showed that they were, in the long run, cheaper than the so-called cheap tools, although higher in the first cost.

**Stalybridge Journeymen Painters** have struck for  $\frac{1}{2}$ d. per hour advance. Their pay at present is 8d. per hour.

**Electric Extensions at Southport.**—It has been estimated that £55,000 will be required for the necessary electric extensions at Southport, and the electricity committee of the corporation has decided to apply to the Local Government Board for permission to borrow that amount.

**Asylum Ventilation.**—In the ventilation of the Ballinasloe County Lunatic Asylum great attention is being paid to the efficiency of the ventilation, which is carried out by means of "Cousland's Improved Climax" patent direct-acting Louvre ventilators of an ornamental design, supplied by the "Climax" Ventilating and Heating Co. Ltd., 93, Hope Street, Glasgow.

**Drainage of Edgbaston and Harborne, Birmingham.**—A Local Government Board inquiry was held on the 12th inst., with respect to an application by the Birmingham City Council to borrow £155,000 for sewerage works, £1,100 for public walks and pleasure-grounds. The sewers in the two districts are unsatisfactory and the money is required to reconstruct them. No opposition was put forward to either scheme.

## Trade and Craft.

### LEAD SEALS.

Messrs. Marshall and Co., electrical and mechanical engineers and instrument makers, motor-car builders, exporters of machinery, &c., of Belsize Works, Clayton, Manchester, are the owners of valuable patents facilitating the manufacture of lead seals, which are so extensively used by corn millers, cement and seed merchants, &c., in sealing up the string used to tie up the necks of the bags, preventing their being tampered with, or the use of the bags (bearing the firms' brands) by other persons to sell an inferior quality of material. These lead seals are very easily and quickly used, and do away with all the trouble and mess of the old wax seals, and cost very little—viz., from 1s. to 7s. 3d. per thousand. The makers also supply special pincers to impress the seals with any design or lettering.

### TERRA COTTA.

Mr. Walwyn T. Chapman, architectural modeller and terra-cotta manufacturer, Grimsby Road, Cleethorpes, has just issued a revised price list of his goods. A most comprehensive list of stock goods is provided, illustrating what can be done in this well-known material. Mr. Chapman undertakes to execute architects' designs with the greatest fidelity and dispatch, by competent workmen, and this is a thing to be noted when building with terra-cotta, for another specially designed block may often be required at very short notice, and may stop the job for some time. He makes a speciality of architectural modelling, and the prices of his goods are extremely low.

### BLINDS.

Messrs. G. A. Williams and Son, of 21, Queen's Road, Bayswater, W., have sent us their illustrated catalogue. This well-known firm have been established as blind manufacturers for many years, and endeavour to make their blinds as unobtrusive as possible, in order to avoid clashing with the architecture. The question of the supply of good and suitable blinds to a building is often neglected by architects, and this results in annoyance to the occupants of the buildings as well as great loss of dignity to a building otherwise perhaps, entirely happy in treatment. The firm's catalogue gives many useful hints on the selection of blinds, and deals with inside cloth blinds, ornamental embroidered blinds, festoon blinds, reefing blinds, blinds for roof lights, lantern screens, inside and outside shop blinds, Venetian blinds, wire blinds, cane blinds, Japanese panels, curtains and curtain poles, spring box blinds, Florentine blinds, Spanish blinds, awnings, Oriental blinds, helioscenes, blinds for doors, shutters or balconies, verandas, &c. They also alter old blinds to suit new positions.

### BRICKS FOR ROADWAYS.

Although bricks have for some time been very largely used in America for street paving, English engineers and surveyors have hitherto confined their attention chiefly to granite, grit, or limestone sets, asphalt or wood blocks. There seems no reason, however, why the American system of brick roadways should not become quite a general one in this country, for there is abundant evidence to show that the American brick roadways compare very favourably in point of economy, durability, cleanliness and convenience with any of the more familiar systems. Messrs. G. Wooliscroft and Son, Limited, of Hanley, Staffordshire, have manufactured a quantity of specially made bricks for street paving, out of which Mr. J. T. Eayrs, M.I.C.E., of Birmingham, took a number promiscuously, and submitted them to severe tests for absorption, abrasion, and impact. The results of these tests are before us in tabular and diagrammatic forms; they may, however, be briefly summarised. The bricks were tested for abrasion and impact by being placed in a tumbler or rattler, 24in. diameter by 30in. long, and revolved for 1,000 revolutions at a speed of twenty-five per

minute. The bricks were carefully weighed before testing, and after 250, 500, 750, and 1,000 revolutions respectively. The average loss in weight on five bricks at the completion of the test was 7.15 per cent. The test for absorption was carried out with rattled bricks in order that they might be tested under such conditions as would obtain in actual use after considerable wear. Before testing, the bricks were dried in a stove for sixty-five hours, and then immersed in water, where they remained for fifty-three hours. The average gain was 1.57 per cent. Applying similar tests to a number of bricks manufactured by representative American firms, Mr. Eayrs finds that the bricks of Messrs. Wooliscroft give considerably better results, and he expresses the opinion that these bricks, if they can be supplied of uniform quality, equal to those tested, and are properly laid, are eminently adapted for the wear and tear of traffic in streets. Visitors to the forthcoming Building Trades' Exhibition at the Agricultural Hall will have an opportunity of inspecting the brick-paving, as a part of the carriage-way of High Street, Islington, is being laid with these bricks, and will, it is expected, be open for traffic by the time the Exhibition opens.

### WOOD CARVINGS AND MOULDINGS.

The Wood-Carving Company Limited, Windsor Works, Windsor Street, Birmingham, are making some patent ornamental solid wood mouldings, friezes, panels, finger plates and lock furniture, picture mouldings, dado and picture rails, electric wire casings, etc., etc. They also execute carved panels and hand-carving of every description to any design. Some wonderful work is being done by this company, for in sharpness and delicateness of detail the carving is, in many ways, quite equal to handwork. The great advantage these mouldings have over the ordinary kind is that they are solid and do not chip or look unsightly, as do the composition mouldings generally sold, and those who have to use the ordinary kind on account of cost will learn with pleasure that the price of these improved ones is extremely low. We notice in the catalogue some extremely pretty overdoors. The great speciality of the Company, however, is their Saracenic Twisted and Turned Mouldings, of which they are the sole makers. These can be laced together in an infinite number of ways, and can be used with excellent effect as enrichments, panel mouldings, hosings, &c.

### A WASHABLE DISTEMPER.

Again we desire to call attention to Hall's Sanitary Washable Distemper (Patented). This water paint sets hard, and being a strong disinfectant, is recommended by medical men for use after all infectious cases; it even destroys fleas, bugs, and other objectionable insects. It is perfectly washable three weeks after being applied, and will stand better than oil paint when applied to a damp wall. It will not scale off, is free from caustic and alkali, and can be painted on or varnished without sizing. It requires no solution or liquid, other than (hot or cold) water, to mix it ready for use, thus making it very cheap; it is also non-poisonous, cleanly in working, and applied easily. Its covering power is considerable, for one hundredweight is stated to cover double the surface coated by an equal quantity of pure white lead paint. The labour per square yard is about forty per cent. less with the distemper than when oil paint is applied, and the saving in the cost of materials and labour together is stated to be eighty per cent. as compared with oil paint. Cracks and holes may be filled with the stiff material, which will set harder than plaster of Paris, white ceilings coated with it will not turn black with sulphur, as it contains no lead, and will not crack or fall off, as is the case with ordinary whitewash. A great advantage of this material is that unlike similar articles it can be made in rich, deep colours, as well as in tints, as is testified by the colour card we have received, and any shade required can be matched. It is sold in tins or in bulk, and may be obtained from

all leading Chemists, Drysalers, Ironmongers &c., or from the manufacturers, Messrs. Sisson Brothers and Co., Ltd., Paint, Colour, and Varnish Works, Hull.

## Keystones.

**Dispute in the Engineering Trade.**—In connection with the conference which we reported last week, it is stated that the employers cannot see their way to grant an advance at present, but are willing to reconsider the question at an adjourned conference, to be held not later than Friday, June 22nd next. The question of then giving one shilling per week advance, to take effect from the first day in July, will be left to the decision of the executives.

**A Bradford Builders' Federation Started.**—A well-attended meeting was held at the Bradford Building Trades and Stone Exchange last Wednesday evening for the purpose of discussing the question of forming an employers' federation for the Bradford district. Rules of the Leeds and other federations were laid before the meeting, and the proposition having been favourably commented upon by the representatives of each trade concerned, it was decided to form such a federation. Rules were adopted, but no officers were appointed. The proceedings were private, and it was decided not to give the names of anyone present. No discussion took place with reference to the plasterers' strike.

**Labourers' Dwellings for Cork.**—A Local Government Board inquiry was held last week, in the Council Chamber of the Cork Municipal Buildings, in reference to the application of the Corporation for a loan of £5,881 to construct buildings for the working classes at a cost of £5,500, and certain sewage works at a cost of £381. The scheme is to erect eleven three-storey dwellings to accommodate about 165 persons, as a part of a large scheme on the site of the present Harpur's Lane Market. There was also a necessity for building several sewers in different parts of the city.

**CONTRACTS OPEN.****BOROUGH of DARLINGTON.****ELECTRIC LIGHTING INSTALLATION.  
TO BUILDERS AND CONTRACTORS.**

The Darlington Corporation invite TENDERS for the various works required to be executed in the ERECTION of BUILDINGS to be used as an Electric Lighting Station in the Borough.

Plans and specifications may be seen and forms of Tender and schedule of quantities obtained (on payment of the sum of £2 2s., which sum will be returned on receipt of a bona-fide Tender, with the schedule of quantities thereto attached properly filled in) on application to the Borough Surveyor, Town Hall, Darlington, on and after the 15th inst.

The contractor will be required to enter into a formal contract for the due performance of the work containing a clause that he will undertake to pay to his workmen the standard rate of wages, and observe the hours and conditions of labour obtaining in the Borough.

Tenders, sealed and endorsed, must be delivered at my office not later than MAY 8th next. Separate Tenders will be entertained for the different trades, but no pledge is given that the lowest or any Tender will be accepted.

H. G. STEAVENSON, Town Clerk.

Town Clerk's Offices,  
Darlington.

April 6th, 1899.

1

**BOROUGH of KEIGHLEY.**

The Corporation are prepared to receive TENDERS for the MASONRY required in ERECTING BRIDGE at Aireworth, and for CONSTRUCTING APPROACH ROAD to same.

Tenders to be in by APRIL 20th.

Further particulars may be obtained at the Office of the undersigned.

W. H. HOPKINSON, A.M.I.C.E.,

Borough Engineer.

**CITY and COUNTY of NEWCASTLE-UPON-TYNE.  
TO IRON ROOF MANUFACTURERS.**

The Finance Committee are prepared to receive TENDERS for the CONSTRUCTION and ERECTION of an IRON ARCHED ROOF over the wide aisle of the Grainger Market, 319ft. long and 56ft. span, built with lattice girder ribs and purlins, to take the place of the present timber roof.

Plans and specifications can be seen, and quantities and further information obtained, at the Property Office, Town Hall, Newcastle, on and after MONDAY, MARCH 27th, 1899.

Sealed Tenders, addressed to the City Engineer, Town Hall, Newcastle, to be delivered before TEN a.m. on THURSDAY, APRIL 20th, 1899.

The Committee do not bind themselves to accept the lowest or any Tender.

By order,

HILL MOTUM,

Town Clerk.

Town Hall,

Newcastle-upon-Tyne,  
March 25th, 1899.

**TO BUILDERS and CONTRACTORS.**

The Joint Committee of the Library Authorities for Croydon and Lambeth invite TENDERS for the ERECTION of a PUBLIC LIBRARY in Westow-hill, Upper Norwood.

The specification, plans, and form of contract may be inspected, and forms of Tender, with copies of the bills of quantities, may be obtained of the Architect, EDWARD HASLEHURST, Esq., 7A, Lawrence Pountney-hill, E.C., upon application, and payment of £3 3s., deposit, which amount will be returned on receipt of a bona-fide Tender.

Tenders (sealed) must be addressed and sent to the undersigned, at the Lambeth Vestry Hall, Kennington Green, S.E., on or before APRIL 24th, after which date no Tender can be received.

The Committee does not bind itself to accept the lowest or any Tender.

HENRY J. SMITH,

Clerk to the Committee.

April 6th, 1899.

**COMPETITIONS.****BOROUGH of HARROGATE.****KURSAAL COMPETITION.**

In deference to the wishes of some of the Competitors in the above Competition, the Council has decided to extend the Time for sending in Drawings to JULY 3rd next.

SAMUEL STEAD,

Borough Surveyor.

Municipal Offices,

Harrogate,

April 13th, 1899.

1

**TO ARCHITECTS.**

The Frome Urban District Council are prepared to receive COMPETITIVE DESIGNS, &c., for their proposed NEW SCHOOL OF SCIENCE and ART.

Premiums £25 and £10.  
Full particulars and plan of site may be obtained of the undersigned upon deposit of fee of 10s., to be returned on receipt of bona-fide Designs, &c.

Designs, &c., to be received by me on or before APRIL 29th, 1899.

By order of the Board,

GEO. W. BRADBURY,

Clerk.

Public Offices, Frome.

March 29th, 1899.

**MIDLOTHIAN COUNTY COUNCIL.****TO ARCHITECTS.**

The Council, having in contemplation the rebuilding of the County Buildings in Parliament-square, Edinburgh, invite Architects to submit COMPETITIVE DESIGNS for the new buildings.

Conditions of the architectural competition and instructions to competing architects, along with a plan of the site, may be obtained on application to the undersigned.

A. G. G. ASHER, W.S.,

County Clerk.

County Rooms,

Edinburgh,

April 6th, 1899.

## HOSPITAL REFORM, FROM A SANITARY POINT OF VIEW.

By T. GARRETT HORDER.

(Hon. Sec. Hospital Reform Association.)

AT first sight there does not appear to be a very close connection between hospital reform and sanitation, but I hope to be able to show that the measures that have been advocated by the Hospital Reform Association, would, if carried out, prove distinctly beneficial to the community at large. That much more attention is paid nowadays to the sanitation of hospitals is happily true. That many defects still remain, especially in the older institutions, can hardly be denied, and it is probable that no measures that could be taken, short of rebuilding, would prove entirely satisfactory. Although much has been done to improve the accommodation for the resident medical and nursing staff, yet I think it must be allowed that much still remains to be done in that direction. That all persons who have to live under the hospital roof should have airy and cheerful living and sleeping rooms goes without saying. I should not on my own responsibility go so far as to say that possibly the Committees of Management have not in the past taken that interest in the well being of the resident staff that they ought to have done, but I am confirmed in my opinion by such an experienced hospital manager as the Honorable Sydney Holland. In a paper read by him at a meeting of the Hospitals' Association in 1896, he made use of the following language: "If I have been deeply impressed with one fact more than another it is this; that a large number of the Committee men of many London hospitals are absolutely ignorant of almost every detail connected with their hospital. They knew their way about it, some of them, not all by any means; they know enough of their matron and secretary to believe her and him when they are told that their hospital is the best in London; but they do not know the condition or inside of any other hospital to compare with their own; they do not know the pay or hours of their own nurses nor where they feed or sleep. They have never given the smallest personal attention to making the lives of the young women easier or happier. They do not know the procedure as to out-patients or in-patients, and they know nothing whatever about the in-patients themselves. This is a fact tested by me in many cases."

Such a statement appears to me to prove the necessity of establishing in all our large cities Hospital Councils or Central Boards, to whom the public could apply for guidance and help before making their contributions. Although this question has not yet been brought to a satisfactory solution in London, yet it is extremely gratifying to note that the Council of the Prince of Wales's Hospital Fund has determined to inspect every hospital before making any further grants to their funds. One can hardly help expressing surprise that a similar course has not been adopted by the Council of the Metropolitan Hospital Sunday Fund. Recent investigation has proved that in this particular respect Dublin is far ahead of any other city in the United Kingdom. Not only is every hospital which applies for a grant regularly inspected by a special committee appointed for that purpose, but the results of that inspection are printed and published for the use of the public. Moreover, every detail in connection with receipts and expenditure is set forth in these reports.

To come now to the more particular object of this paper, I will place this proposition before my readers: That the aggregation of large numbers of sick people in the out-patient department of our hospitals and infirmaries is detrimental to the well-being of the patients, is unnecessary, and is likely to cause the spread of infectious disorders.

Take the usual waiting-room of a large city hospital, and what do you find? A large congregation of men, women and children (and more particularly the two latter) suffer-

ing more or less from every conceivable disease, mixed indiscriminately together, patiently waiting their turn to be called before the physicians and surgeons in attendance. Can the waiting room attendants be expected to distinguish between infectious and non-infectious cases? You could hardly expect them to distinguish between a case of mumps and a case of ordinary swollen face, or between a case of roseola and a case of scarlet fever, or between a case of erythema and a case of measles. I am not in a position to give many statistics bearing on this particular point, simply because few hospitals publish statistics of the diseases met with in their out-patient departments. I can give, however, figures from one hospital in Manchester, and one in Liverpool, which will prove that the danger of infection is a real and not a fancied one.

In the Clinical Hospital, Manchester, in 1895, the following cases were treated in the out-patient department: Measles, 8; whooping cough, 9; chicken pox, 6; enteric fever, 2; erysipelas, 2; pediculi, 40; scabies, 50.

In the Liverpool Infirmary for Children, in 1896, the following cases were treated in the out-patient department: Typhoid fever 9; scarlet fever, 15; measles, 7; whooping cough, 55; chicken pox, 32; mumps, 17; diphtheria, 17; pediculi, 47; scabies, 32.

It may be assumed that a similar condition of things occurs in the majority of the out-patient departments.

Apart from the danger of spreading infectious diseases, I maintain that much suffering is caused by the long hours of waiting in a densely crowded apartment, that patients who suffer from acute disorders are made worse by long waiting in a vitiated atmosphere, and that the physicians and surgeons (especially the former, for, as a rule, there are twice as many medical as surgical cases) are wearied out by having to attend to such a large number of patients, and are consequently often not able to do full justice to cases that require their best energies to treat. The out-patient department of our general and other hospitals is fast becoming unmanageable, and it will really be necessary to make some radical changes.

In the Report of the Birmingham Hospital Reform Inquiry Committee, I find it stated "that the actual number of persons who received hospital treatment during the year 1889 can only be arrived at as a matter of estimate, and the Committee think that it may be put down as being somewhere between 140,000 and 150,000 persons. The figures (the Committee go on to say) are of very serious import. On the one hand they bear conclusive testimony to the high estimation in which the hospitals and their staffs are held by the public. On the other hand, the existing medical staffs are overworked by reason of the swarms of out-patients who crowd to the hospitals for treatment. This puts unfair pressure upon the visiting physicians and surgeons, and is detrimental to the patients themselves in two ways. In the first place, serious or complicated cases cannot receive that careful and prolonged medical investigation which would otherwise be afforded them, and secondly, the length of time which a patient has to wait before his turn comes to see the doctor must often be injurious to him. There is a further evil which results from the overcrowding of the out-patient departments—namely, that from want of time the physicians and surgeons cannot adequately utilise them for purposes of medical instruction to the students. If the number of patients go on increasing at anything like the rate at which they have increased of late years, an utter breakdown of the present arrangements must be the result."

Then referring to the question of the ailments of out-patients, the committee say: "A man who cannot afford to pay for the proper treatment of a severe or complicated malady, or a long illness, may well be able to pay ordinary medical fees for a trivial ailment of short duration, and it is an abuse of hospitals to take up the time of the eminent physicians and surgeons who constitute the visiting staff with crowds of trivial cases, to the detriment

of the really serious cases which call for all their skill and attention."

It is plain that the question whether a patient is a fit subject for hospital treatment depends partly on pecuniary and partly on medical considerations. No one but a skilled medical man can be trusted to say whether a case is serious or trivial. But wherever the line should be drawn between fit and unfit cases, the great weight of the evidence shows that as regards out-patients it is widely transgressed.

The recommendations agreed upon by this committee were as follows:—

1. The formation of a general council representative of all the public medical institutions of the city.
2. The formation of an Inquiry Agency to investigate the circumstances of applicants for treatment at the hospitals.
3. That apart from first aid and urgent cases, regulations should be passed by the hospitals to exclude trivial cases and cases where either the patients are in a position to pay for such treatment as they may require, or which could be more properly dealt with under the Poor Law.
4. That facilities should be given for cases, so excluded, being dealt with by dispensaries or provident dispensaries.
5. That any person recommended by an approved provident dispensary or by a qualified medical practitioner, should as a rule be admitted to the out-patient department of the hospitals without further formality.

In conclusion, may I say that in addition to the above valuable recommendations it would be advisable to make provision for the periodical inspection of all hospitals by the Medical Officer of Health, and that officer should be requested by the sanitary authority to publish a report dealing with defects that have come under his notice. We have rules and regulations dealing with overcrowding, &c., in lodging houses; why shouldn't we therefore take every possible precaution to ensure that the sick in our hospitals are being dealt with under the most favourable hygienic conditions? In order to avoid all chances of conveying infectious diseases in waiting rooms, and also to discriminate between trivial cases and cases that really require hospital treatment, it seems advisable in all large hospitals to appoint a special resident medical officer to carry out such duties. It is well to note that such a system has been in operation for some years at St. Thomas's and St. George's Hospitals, and that recently the authorities of St. Mary's Hospital have made a similar appointment.

**Shambles at Wednesbury.**—The Wednesbury Town Council has decided to make an application to the Local Government Board for sanction to borrow £2,810 for the purpose of purchasing shambles, and to carry out street improvements.

**Ludlow Sewerage Scheme.**—A provisional order, applied for by the Ludlow Town Council, for the purchase and taking of seven acres of land on the Hucks Barn Estate, Ludford, near Ludlow, otherwise than by agreement, has been received, and the sanitary committee are making preparations for plans for the septic tank system.

**Upperstone Valley Sewerage.**—At a meeting last week of the Upperstone Valley Main Sewerage Board, the question of making alterations and additions to farm buildings at Whittington was considered. The chairman said he wished the board to realise that the farm did not require so many buildings as were planned, but it would require them in about two or three years, and probably more, because as the farm developed into a sewerage farm so would the requirements for buildings continue to increase. Ultimately, after much discussion, it was decided to leave out of the scheme a range of buildings on a part of the farm. This will bring the cost of the scheme, which was £3,000, down to £2,000. It was also decided to erect five cottages, two at the Whittington farm and one each at Tivdale, Tetford, and Cradley Pool, at a total cost of £1,750.

## THE PLASTERERS' DISPUTE.

THE dispute has had one good result, and that is, the bringing of the masters into closer touch with one another, and the formation of a national association. In the past they have been organised only by the federation with the Master Builders' Association, but at a meeting in the rooms of the Bradford Stone Exchange it was decided to form a national association to safeguard the interests of master plasterers in particular, and also to work in conjunction with the Master Builders' Association. At the meeting in Bradford nearly one hundred delegates were present. An executive committee was also formed, and Mr. J. H. Sugden, of Bradford, was elected as the association's first president, with Mr. Hodkin, of Sheffield, as secretary *pro tem*. Subsequently the present dispute was discussed, and it was decided to forward a communication to the Master Builders' Association on the subject.

In a letter to the "Daily Chronicle" of the 11th inst., signed by "Provincial Employer," attention was drawn to the possibility of arbitration, which the writer thought would be the wisest course to take under the circumstances.

With regard to the meeting held on the 6th inst. the opinion of the members of the Plasterers' Union on the action of the Executive Council is in favour of what was done. The men state that if the proposals of the masters had been accepted, their position would have been made worse than it was before the ten weeks' strike of 1896, and the rights they won by that fight would have been lost.

In the provinces the men seem to be still firmly resolved to abide by instructions from headquarters in London. Various associations have been formed. It is stated in a Yorkshire paper that architects are in thorough sympathy with the action of the master builders, owing to the excessive cost of work during the last two years. At a meeting in Bradford last Thursday of the Yorkshire Federation of the Master Builders a letter was read from the National Association of Master Plasterers, calling on the builders to declare a lock-out in all branches of the building trades; and at a meeting in Derby to-morrow it is intended to advocate this step. The co-operative society in Leeds has engaged the whole of the hands who have not left the district for jobs elsewhere.

Last week's issue of "The Guardian" has an interesting leader on the dispute. It says: "Every trade dispute runs the same wearisome course, through misunderstandings to mutual recriminations, charges and counter charges, it drags its way through a costly strike or lock-out, and issues, for the most part, in a compromise that settles nothing. In nine cases out of ten the real point at issue, overlaid in the course of the dispute by half-a-dozen subsidiary quarrels, is one which admits of no compromise, and is only decided by *force majeure*. Thus in the case of the plasterers a dispute, which a newspaper so friendly to workmen as the "Daily Chronicle," has characterised as "senseless," is in reality concerned with the question whether unionists are to allow non-unionists to work with them, or are to coerce them and the employers by striking or threatening to strike if they are employed. In itself the question seems a perfectly simple one, and in proportion to its simplicity is the impossibility of a solution likely to be acceptable to both parties. Either the non-unionists will be coerced, or they will not; either the unionists will work with them, or they will not. . . . On the merits of the case it is less difficult than usual to pronounce, inasmuch as the claim put forward by the men was more aggressive than usual. They demand not merely that the workmen employed shall be unionists, but that the foremen should be coerced into joining the union. This seems to us a claim so impossible to admit as to be little short of impudent."

## Builders' Notes.

**The Allenton Schools, Derby,** are being warmed and ventilated by means of Shorland's patent Manchester grates, supplied by Messrs. E. H. Shorland and Brother, of Manchester. The same grates have been supplied to the Girls' Intermediate Schools, Cardiff.

**Builders and Bye-laws.**—At the Tyne-mouth County Petty Sessions last week, J. C. Hope, Crown Street, Elswick Road, Newcastle, was summoned for failing to give proper notice in writing to the local surveyor before commencing to erect certain buildings, at Wallsend, on the 16th ult. Mr. W. S. Daglish, clerk to the Wallsend Urban District Council, prosecuted, and said the plans were strictly in accordance with the bye-laws, but the defendant had neglected to give the proper notice to the authority before commencing to build. He had received a letter from Mr. Hope, regretting the irregularity.—A fine of 1s. and costs was imposed. William Thompson, builder, Ninth Avenue, Heaton, was summoned for a similar offence. Mr. Daglish read a letter from Mr. Thompson, expressing regret that he had unwittingly made a technical error, and explaining that he was always anxious to comply with the bye-laws.—Defendant was also fined 1s. and costs.

**A Point in Bankruptcy Law.**—At Rochester County Court, Edward Edwards, a jobbing builder, sued William Ward, the owner and occupier of Florence Villa, Grove Road, Frindsbury, for 10s. 6d., for work done in opening up a cesspool, &c., and attending the City Surveyor in relation to plans and awaiting instructions. The plaintiff complained that the job had been given to someone else to finish.—Defendant's wife alleged that the work had not been done properly, nor with reasonable despatch, and someone else had to be got to finish it.—Plaintiff had made a similar claim against George William Rotherham, owner and occupier of the next villa, in respect to the same work. The defence in that case was the same as in the first, and it was further stated that in 1895 the plaintiff had been adjudicated bankrupt in the same court, and the work in question had been done just prior to his bankruptcy.—His Honour said that in that case the plaintiff could not recover this money. Whether the Official Receiver would was another matter. There would now be a non-suit.

**Damage Caused by Falling Mortar.**—In the City of London Court, before Mr. Commissioner Kerr, an action was brought by Alfred Pickard, 106, Liverpool Road, against F. F. and J. Wood, builders, Cleveland Street, Mile End, to recover damages for having a suit of clothes, &c., spoiled through the negligence of their men. It appeared that the defendants, on January 11th, were engaged in building operations at premises in Houndsditch. When the plaintiff walked along the pavement some mortar and lime fell through the scaffolding on to his hat, clothes, tie, &c., all of which were spoiled. Mr. Stephenson, the defendants' counsel, said that they had permission from the City Corporation to erect the scaffold, which was properly fixed. The plaintiff must have gone inside the building. Mr. J. H. Welfare, the plaintiff's solicitor, said that was simply ridiculous. Mr. Commissioner Kerr thought there was plenty of evidence of the scaffolding being insufficient. The mortar would not have poured down on the plaintiff otherwise. Fortunately the damage was not considerable. There would be judgment for the plaintiff for £3 10s. and costs. The defendants' men should have been more careful.

**The Workmen's Compensation Act—A Broken Ankle.**—Mr. Adshead Elliott, barrister, sat at the Manchester County Court last Thursday, as arbitrator under the Workmen's Compensation Act, 1897, to hear a claim for compensation made by Harry Lodge, a foreman

bricklayer, residing at Tiverton Place, Ardwick, against Benjamin Morton, a sub-contractor, in connection with the erection of the Midland Hotel, Peter Street. Mr. Symonds, barrister, appeared for the applicant, and the respondent was represented by Mr. Acton, barrister. On December 23rd last the applicant, in the course of his work at the site of the new Midland Hotel, was knocked down by a travelling crane. The ankle of one leg was broken, and that of the other was severely sprained. He had since been under medical treatment. At the time of the accident he was in receipt of £2 10s. per week. Dr. Russell, Longsight, called for the applicant, said he thought it would be three or four months before the applicant would be able to get about at all, and that it would be at least twelve months before he would be able to trust himself on the leg of which the ankle had been broken. Dr. Brown, Higher Broughton, for the respondents, considered that the applicant would be able to resume work in six months. The arbitrator awarded the applicant £1 per week during total incapacity to work, and intimated that application might then be made to him again.

**Building Regulations at Felixstowe.**—At the Woodbridge Petty Sessions a case was heard in which Messrs. Spencer, Santo, and Co., Ltd., of London, were summoned for erecting a certain building, and further with continuing the process of erection, after receiving notice to desist. Mr. Jennings, who appeared for the Felixstowe Urban Sanitary Authority, said that according to Bye-law 53, every person who erected a building was bound to leave an open space at the rear exclusively belonging to that particular building. At the commencement of the bye-laws there was a definition of a domestic building, in which the present case was clearly embraced. The house they had before them had been divided, and a portion taken off and made into a new building. Part of this building was now let as a shop in Hamilton Road, and it would be claimed that the air space for the one behind was sufficient for both. Mr. G. H. Horton, the surveyor who drew up the plans deposited, said that in August a shop front was placed in Hamilton Road, and alterations were effected which practically made it into two buildings, and the air space for the hindmost had to serve for both. Mr. Glen, who represented the defending firm, said that the buildings were not separately rated, and the premises had existed exactly as at present since he had known them, with the exception of the shop front and counters. When the house was separately occupied, the door communicating between the two parts was bolted on one side at least. The new water-closet and drainage in substitution for the old ones were the points disapproved of by the Council in July. According to Mr. C. G. Havell, medical officer of health for Felixstowe and Walton, the buildings, as at present situated, had not sufficient air space, and he considered them objectionable.—Mr. Glen, in defence, said that, beyond Section 159 of the Public Health Act, the prosecution had no authority at all, for the premises were built before the regulations were made. Bye-laws made with reference to new buildings did not apply to old houses. It would be very hard to make them affect houses which were built before the regulations came into force. There had been no contention that the premises had been built latterly, or that they had been converted. His clients had not converted the houses, and had only bolted the door leading between the two parts of the house. If there were two buildings now, there were two buildings before; and he held that the new shop front alone did not affect the question at all. What had been done was done in the original erection of the house. If it was not effected then, it was done subsequently, but before his client had come into possession, and was, therefore, done before the regulations affecting it came into force.—The Bench retired, and on returning, the chairman said that the majority did not consider the premises a new building. They would, therefore, dismiss the case, each side to pay its own costs.

## Masters and Men.

**Plumbers' Wages.**—The operative plumbers of Ashton, Stalybridge, Hyde, and district made an application for an advance in wages from 8½d. to 9d. per hour, to commence on June 24th next. If the increase is not granted it is expected that arbitration will be resorted to.

**The Scarborough Master Builders' Association** have informed the Labourers' Union, in answer to their request for a conference, that if they are prepared to discuss without prejudice their objection to working with non-Union labourers, and will give their deputation full authority to settle the dispute, a committee of the Masters' Association will be appointed at once to meet them.

**Close of the Arbroath Joiners' Strike.**—At a mass meeting of the Arbroath operative joiners last Thursday it was intimated that the masters at a meeting held the previous night had agreed to sign the bye-laws. The masters had already granted the men an increase of wages—from 7½d. to 8d. per hour—but they had refused to sign the bye-laws which had existed last year as to country work and other matters.

**The Carpentry and Joinery Trades.**—According to the employment returns issued by the Amalgamated Society of Carpenters and Joiners, the above-mentioned trades have not been materially affected by the Plasterers' dispute. This society has only 828 members on unemployed benefit, out of a total of 58,000, representing a proportion of 1·4 per cent., and in the Manchester branches there are about 24 members on donation, which is about 4·5 per cent. of the local membership. Demands for higher wages are in the hands of the employers in various districts. In Manchester, Liverpool, and Fleetwood, the men have asked for a penny per hour advance, the notice to expire at the end of the present month. A similar demand has been put forward in Rossendale, where the notice will expire a month later. In Wigan the workmen have asked for a penny per hour advance, the notice expiring at the end of this month. At Barrow the employers have already granted an increase of wages to the men. No friction of any serious character has arisen or seems likely to arise in connection with the wages movements referred to above.

**Halifax Joiner's Strike: Judge's Decision.**—In last week's issue we gave a full report of this case, which was before Mr. Justice Sterling in the Chancery Division, and was an action brought by the plaintiff Charnock and twenty-five other master joiners, of Halifax, to restrain the defendants, two prominent members of the Union of Joiners, at Halifax, from watching or besetting the plaintiffs' premises or interviewing their workmen with the object of inducing or persuading the men not to work for the plaintiffs. The case came on again on April 12th, when His lordship referred to the Acts relating to trades unions, and, having reviewed the evidence on this part of the case, expressed the opinion that what the defendants had done at Fleetwood, both at the landing stage and the railway station, amounted to an illegal act, and, therefore, the plaintiffs were entitled to an injunction. But as regarded what happened at Halifax when the men arrived there, there was a great conflict of evidence. The defendants said that they only interviewed the men with the legitimate object of obtaining and communicating information. Having carefully read the evidence on the one side and the other with respect to what happened at Halifax, he came to the conclusion that it was not a case in which he ought to grant an interlocutory injunction, and therefore that portion of the plaintiffs' case failed. This point could only be decided at the trial. His lordship granted an injunction as to Fleetwood, or any other place where the men might be landed, as he had already intimated. Judgment was given accordingly.

## Engineering Notes.

**Sir Courtney Boyle** presided last week over the Board of Trade inquiry into applications by the Smithfield, Metropolitan, and Charing Cross Companies for Provisional Orders, enabling them respectively to compete in the supply of electric lighting in the City as against the City of London Company. After some discussion it was decided that the Board of Trade should communicate with the Corporation before coming to any conclusion in the matter.

**Lowestoft Electric Lighting.**—A Local Government Board inquiry was held by Lieutenant-Colonel A. C. Smith, R.E., last week, into an application made by the Lowestoft Town Council to borrow £30,000 for purposes of electric lighting. The estimate of capital outlay is as follows:—Buildings, £4,000; generating plant, including boilers, engines, dynamos, accumulator, battery, switchboard, pipework, pumps, engine-room overhead travelling crane, and station lighting, £7,973; underground mains for private lighting, £8,162; public arc and glow lighting, £757; meters and house service connections, £2,000; engineering and legal expenses, £1,500; contingencies and unforeseen, £500; extension to Belle Vue Park, seven arc lamps, and private distributing mains, £480; also the Grand Hotel, Kirkby, thirteen acres for private distributing mains, £2,800; total £28,172.

**A Contract Case.**—At the West Bromwich County Court, before his Honour Judge Young, an action was brought by James Lees, engineer, of Manchester, against J. and S. Roberts, of the Swan Iron-foundry, West Bromwich, to recover £7 2s. 4d. paid by plaintiff for goods in excess of price fixed in a contract alleged to have been entered into between the parties. It appeared that early in October plaintiff ordered a quantity of tubing and special fittings from defendants, to be delivered in fourteen days. The goods, it was stated, were not delivered by the time arranged.—Mr. Ward, for the plaintiff, contended that the plaintiff was entitled to recover the amount claimed, which he had paid to another firm of tube manufacturers in excess of that which the defendants had quoted for the goods.—Mr. Darby, for the defendants, handed in the correspondence, and urged that there was no contract, as before the place of delivery was settled the plaintiff cancelled the contract.—The Judge held that there was no contract, and gave judgment for the defendants, with costs.

### South-Eastern Railway Improvements.

—A large number of improvements, involving the expenditure of many thousands of pounds, are to be effected in connection with the South-Eastern Railway. Extensive locomotive sheds and shops, costing about £60,000, with machinery and cottages for workmen to cost about £50,000, are being constructed at Slade's Green. At Bricklayers' Arms Station there are to be new sheds which are estimated to cost about £30,000. The old low-level station at London Bridge is to be thoroughly renovated, and trains from Redhill and Caterham will be able to go on to Cannon Street or Charing Cross. The alterations at the low-level station will practically involve complete reconstruction; there will be a new entrance, and a new booking office, and the rearrangement of part of the present general offices will be effected. The total cost of this work is estimated at £25,000. At present from the Surrey Canal to St. John's there are four lines, and under a new scheme two more lines are to be put down from St. John's to Orpington, involving an outlay of about £400,000. Beyond Orpington the double sets of rails will be provided at railway stations only; but this scheme will practically necessitate the reconstruction of every railway station on the main line. As soon as the necessary Parliamentary powers have been obtained a start will be made at Tonbridge

Junction, where it will be needful to alter the levels of the bridge which carries the main road across the railway. The expenditure at Tonbridge is estimated at £40,000. For Ashford Station plans are being prepared which will provide for six separate roads, so that Dover and Margate trains can both pull up in the station at the same time, instead of having to wait for each other as at present. The outlay at Ashford is calculated at over £60,000. The smaller stations between these important junctions will be taken up later, but eventually every station is to be rebuilt and have its four sets of rails, so that an express can always pass through without interfering with local traffic. At Maidstone about £22,000 is being spent on station improvements.

### Lord Kelvin on Refuse Destruction.

Lord Kelvin has just prepared a report on some investigations made by Professor Archibald Barr and himself in Edinburgh, Bradford, and Oldham, on the subject of the destruction of town refuse. The report is altogether a remarkable document, and is not only of great interest to local authorities, but to the general public. In one instance he experimented on damp ashpit refuse, containing a large proportion of night soil and vegetable matter from markets and shops. This was consumed without the slightest trace of smoke. In addition to this solution of the smoke difficulty, the residual products proved to be of great commercial value. In another case the steam produced by the process of destruction was utilised for the driving of electric lighting machinery and other power purposes. No coal or coke whatever was employed, and in this instance also there was an entire absence of smoke. Lord Kelvin's report demonstrates that our public bodies have no longer any excuse for referring to "waste products," but have within their reach the means of turning the most unpromising kinds of refuse to a highly profitable account.

**The City's Electric Lighting.**—A specially convened meeting of the Court of Common Council, presided over by the Lord Mayor, was held at the Guildhall recently for the purpose of considering electric lighting questions. At the beginning of the proceedings the Town Clerk read the opinion of Mr. Danckwerts, barrister-at-law, who had been consulted as to whether, under the provisions of the 42nd Section of the Sewers Act, 1848, and the 53rd Section of the Act of 1851, contracts made with the City of London Electric Light Company were not null and void in consequence of Sir Joseph Savory, M.P., and other members of the Corporation, who were shareholders or promoters of the Electric Lighting Company, having taken part in granting the contracts. Mr. Danckwerts was emphatically of opinion that the contracts were, in consequence, null and void. On the recommendation of the Streets Committee, and acting on the advice of the City solicitor, it was resolved to take further legal opinions on the matter before finally deciding as to the course which should be adopted with regard to the existing contracts. The Court then proceeded to discuss at great length recommendations of the Streets Committee suggesting that evidence should be tendered on the part of the Corporation at the adjourned Board of Trade City electric lighting inquiry, and that the Board of Trade should be advised against granting more than one provisional order for the supply of electric light in the City. The report of the committee further recommended that if the Board of Trade should be advised to allow competition in the City, the Corporation should have the right to purchase upon terms the whole of the undertaking, whether within or without the City, and that safeguards should be enforced for the purpose of preventing an amalgamation of the competing companies. The report was agreed to, with the exception of that portion which recommended only one provisional order for the City, and in regard to this it was resolved, in view of the opinion of counsel, to advise that no preference ought to be given to one company over another.

# Surveying and Sanitary Notes.

**Street Widening in Leeds.**—Holbeck Lane is to be widened, and a new street constructed from it to Springwell Road.

**Ardrossan Drainage Scheme.**—The Ardrossan Commissioners have agreed to adopt a scheme which will carry the main drainage outlet from Montgomerie Pier to a point outside the harbour. This will cost about £3,400.

**Proposed Shambles at Arbroath.**—The sub-committee of the Cleansing Committee of the Police Commission of Arbroath has decided to advertise for competitive plans for new shambles.

**Ilkeston Requirements.**—The Ilkeston Town Council having applied to the Local Government Board for permission to borrow £4,630 for improvements in Bath Street, and £450 for the construction of an underground sanitary convenience in the Market Place, Inspector Robert H. Bicknell, attended at the Town Hall recently to inquire into the circumstances. The Town Clerk explained that £3,730 was required for the purpose of widening the street adjoining premises No. 155, Bath Street, and £900 for improvements at the south end of the street, near the Market Place. With respect to the £3,730, the price given for the property

was £2,775, the proposed alteration to the premises was estimated to cost £565, and there were premises in the rear which would have to be rebuilt in order that the property might be put in a complete condition, the expense of this being £350; the footpath in front would cost £12 7s. 6d., and the legal expenses would be £25, making a total of £3,727 7s. 6d.

**The City Engineer's Annual Report** to the Corporation states that the length of new sewers constructed in London during the year was 137ft., and the number of houses drained, 176. Negotiations had been continued to acquire the various interests in the premises required for the widening of the southern side of Fleet Street. Several claims had been settled, and one frontage set back to the new line. The remaining claims were ready for settlement. The premises 19 and 20, Fleet Street, nearly opposite St. Dunstan's Church, being about to be rebuilt, a favourable opportunity occurred for widening Fleet Street at its western end, and the London County Council had agreed to contribute £20,000 towards the cost; this the Corporation had accepted. The improvement at the western end of Cheapside had occupied attention, and many interests had been acquired. All remaining claims were under negotiation. The London County Council had declined to contribute to the widening of London Wall, on the ground that the land in Finsbury Circus, &c., having realised a higher price than it would have otherwise fetched owing to the intended widening, the Corporation were not entitled to compensation. With regard to the large area destroyed by the great fire in Cripplegate, when three and a half acres were demolished, the Corporation gave

great attention to the question of effecting improvements. Many schemes and estimates for widening the existing thoroughfares and for forming new streets were prepared, but the London County Council had declined to contribute towards any of them. Failing to obtain any contribution from the London County Council, the Corporation, considering that any improvement, if carried out, would be of a metropolitan and not a local nature, did not feel justified in proceeding by themselves. The result had been that the properties on the site had been rebuilt on the old lines of frontage, and no improvement effected. An arrangement had been made for widening Lothbury on the south side between Prince's Street and the Old Jewry. The London County Council had agreed to contribute one-third of the cost of making the street 50ft. wide. The Corporation were forming a new street between Fenchurch Street and Crutchedfriars—40ft. wide, the owner of the land paying £6,000 towards the cost—and, on the invitation of the London County Council, were contributing one-half the cost of widening Mansell Street, one of the direct approaches to the Tower Bridge. The price paid to the Gas Light and Coke Company for public lighting had been 2s. 3d. per 1000 cubic feet. As regarded the electric light, 502 arc lamps were being used, but the question of lighting the side streets by electricity was still under consideration. The number of defective lamps observed was 886, for which the company was fined in each case. On the application of the Drinking Fountain Association, the whole of the cattle troughs and drinking fountains belonging to them within the City were transferred to the Corporation, who had undertaken to maintain them.

## COMPLETE LIST OF CONTRACTS OPEN.

DATE OF DELIVERY.	WORK TO BE EXECUTED.	FOR WHOM.	FROM WHOM FORMS OF TENDER MAY BE OBTAINED.
BUILDINGS—			
April 21	Applegarth, Richmond, Yorks.—Addition to Farmhouse	British Co-operative Society	Clark and Moscrop, Architects, Darlington.
" 21	Barnsley—Store and House	"	G. Moxon, 26, Church-street, Barnsley.
" 21	Dewsbury—Semi-detached Villas	"	J. L. Fox, Architect, Bond-street, Dewsbury.

Property and Land Sales.

Between BLACKHEATH and CHARLTON.

Important FREEHOLD BUILDING ESTATE.

To Land Companies, Capitalists, and Building Speculators.—The choice Freehold Building Estate, known as Eastcombe, a portion of the estates of the late William Angerstein, Esq., on the main road from Blackheath to Charlton, about half a mile from Westcombe Park and Charlton Station, from whence London is reached by South-Eastern Railway in twenty minutes, about a mile from Blackheath, and in the midst of a healthy and highly popular district, comprising a most commodious Family Residence, with two lodge entrances, stabling, charming pleasure grounds, and well-timbered miniature park, let on yearly tenancy of £280 per annum; together with beautifully undulating pasture land, extending from the Charlton-road with long frontage thereto, to Victoria and Invieta roads, Westcombe-hill, the whole comprising 38 acres. The estate is immediately ripe for development, and offers exceptional facilities to capitalists for the creation of ground-rents, and the demand for middle-class houses in this favourite locality assures successful building operations.

MESSRS. BEADEL, WOOD and CO. will

SELL by AUCTION, at the Mart, Tokenhouse-yard, London, E.C., on TUESDAY, MAY 16th, at ONE o'clock precisely, the above valuable BUILDING ESTATE, in one lot.

Particulars, with plan and conditions of sale, may be obtained of W. T. HARTUP, Esq., Solicitor, Norwich; at the Mart; and of Messrs. BEADEL, WOOD and Co., 97, Gresham-street, E.C.

BLACKHEATH and GREENWICH.

VALUABLE FREEHOLD BUILDING LAND.

To Builders, Land Companies, and Speculators.

A plot of valuable Freehold Building Land, ripe for the immediate erection of villa residences, situate in and having an important frontage of 172ft. to Westcombe-hill, within five minutes' walk of Westcombe-park Station, on the South-Eastern Railway, and only twenty minutes' ride from London Bridge, and containing about half an acre. With possession.

A valuable Freehold Building Site, known as Combe Farm, available for the erection of first-class villas and shops, situate in and having a frontage of 300ft. to Westcombe-hill, and 200ft. to Milton-road, adjacent to Westcombe-park Station, and containing about 2 acres. Let on a yearly tenancy.

A block of Freehold Building Land, of about 6 acres, with a frontage of 1100ft. to Horn-lane, near the Woolwich-road, and let on a yearly tenancy. Suitable for the erection of manufacturing premises.

An important area of Freehold Building Land, situate adjacent to the Woolwich-road, ready for the immediate erection of houses and business premises, and containing about 26 acres. Let on a yearly tenancy.

MESSRS. BEADEL, WOOD & Co. will

SELL by AUCTION at the Mart, Tokenhouse-yard, London, E.C., on Tuesday, May 16th, 1899, at one o'clock precisely, in four lots the above valuable FREEHOLD PROPERTIES, being a portion of the estate of the late William Angerstein, Esq. Particulars, with plans and conditions of sale, may be obtained as above.

Auctions for the Year 1899.

MESSRS. TROLLOPE'S SALES OF FREEHOLD and LEASEHOLD ESTATES, HOUSES, GROUND-RENTS, &c., will take place at the Mart, E.C., as follows:—

Thursday, April 20th	Thursday, August 3rd
Thursday, May 18th	Thursday, October 19th
Thursday, June 8th	Thursday, November 23th
Thursday, July 13th	Thursday, December 14th

Sales will be held on other dates as required. In all cases Messrs. Trollope will be glad to have as long notice as possible respecting any property they may be instructed to offer by auction.

Forthcoming Sales for the Year 1899.

MESSRS. E. and H. LUMLEY (Lumleys, of St. James's House, 22, St. James's-street, London, S.W.) beg to announce the following days of SALE by AUCTION, for the forthcoming year, at the Mart, Tokenhouse-yard, E.C.; but, in addition, other dates can be arranged for special sales. Terms on application.

Tuesday, April 25th	Tuesday, Aug. 15th
Tuesday, May 23rd	Tuesday, Sept. 12th
Tuesday, June 6th	Tuesday, Oct. 17th
Tuesday, June 20th	Tuesday, Nov. 14th
Tuesday, July 4th	Tuesday, Nov. 28th
Tuesday, July 18th	Tuesday, Dec. 12th.

Messrs. E. and H. Lumley announce in the advertisement columns of the "The Times" on Saturdays a complete list of their sales, which will include estates in England, Ireland, and Scotland, town and country properties, ground-rents, reversions, gas and water shares, stocks, &c. In cases where property is to be included ample notice should be given in order to insure due publicity.—St. James's-house, No. 22, St. James's-street, S.W.

By EDWIN FOX and BOUSFIELD,

At the Auction Mart,

On Wednesday, May 10th,

At Two o'clock, in one Lot.

MILL-HILL, Hendon.—Valuable FREEHOLD ESTATE, well situate, opposite the Mill-hill Station, on the Great Northern Railway, with its capital service of trains to King's-cross, Moorgate-street, and Broad-street, and within eight miles by road of Regent-street. The property comprises nearly 100 acres of ornamentally timbered pasture land, with a gentle, warm southern slope, almost entirely surrounded by parish roads, to which there is about a mile and a half of existing frontage, and great scope for creating other leading thoroughfares. There is a substantial house known as Bittacy Farm, with a capital

range of outbuildings. The estate in its present form commands a rental of £300 a year, and is capable of development by judicious building operations, or the creation of freehold ground-rents. The land is exceedingly well circumstanced for the formation of through roads, and the creation of new frontages in addition to those it already possesses.

Particulars at the Mart; at Messrs. EDWIN FOX and BOUSFIELD's Office, 99, Gresham-street, Bank, E.C.; and of the

Vendors' Solicitors, Messrs.

SOAMES and THOMPSON,

12, Coleman-street, E.C.

## An Architectural Causerie.

**"Why Can't You Let it Alone?"**

WHEN the Queen's first Prime Minister, Lord Melbourne, uttered that peevish query, he was criticising the action of Reformers unnecessarily tinkering at the Constitution of the realm, and he echoed the sentiments of many worthy citizens who saw in the tactics of amateur politicians nothing save a fussy and childish thirst for change, for the sake of change alone. It was, perhaps, most fortunate for his peace of mind that Lord Melbourne was gathered to his fathers, in the early days of that dawning Era of Unrest which has uprooted so many ancient landmarks, and is known humorously as the "Age of Progress"; for our rulers, greater or lesser, through the whole gamut of Government, from Imperial Parliament, through the County Councils, down to Corporations, Vestries, and Rural Councils, have long since forgotten the beautiful art of "letting it alone." It would be possible to preach a very eloquent lay sermon on the quite unnecessary fads, experiments, and alterations that have been, and are being made, in all manner of things; from the municipal common lodging-houses of London, and the rate-aided workmen's dwellings of experimentalising provincial towns, down to the latest piece of man-millinery devised by the wiseacres of the War Office for the clothing of the "thin red line." This, however, is scarcely the place for such an excursion in criticism. The occasion for these remarks is a much more simple, though not less important, issue. Let us state the facts. A year ago, or thereby, died an admirable lady, a member of the Royal Family, and one respected for her interest in charitable and philanthropic affairs. The Duchess of Teck, thus suddenly cut off, took a leading part in such things. She did not, as many suppose, contribute to those objects out of her own purse, but she endured and cultivated the acquaintance of those snobs who are ever ready to contribute largely to any scheme, good or ill, so long as their subscriptions bring them into bowing acquaintance with Royalty. The fact works prettily when Royalty interests itself in works of benevolence, and when Royalty dies, then the good it did sometimes lives after it in the shape of memorial almshouses, and the like. The Duchess of Teck was a well-known figure at Richmond. The local tradesmen remember her keenly, and so do the local toadies and tuft-hunters. It is these latter who have raised money to erect a memorial drinking fountain to her in what they are pleased to call that "Royal Borough," and thereby hangs the thread of this discourse. The view from Richmond Hill is world-famed. From it, and from the Terrace, the eye ranges over a panorama of pasture, wood, and water, unrivalled in the Home Counties. Some

years ago the Corporation of Richmond purchased the Duke of Buccleuch's estate here, to prevent building and to preserve the famous view for all time, and only last year the local authorities defeated a scheme for an electric tramway along this very terrace, solely on the plea that it would injure what the committee of butchers, bakers, and candlestick-makers, who sit on such subjects at Richmond, grandiloquently term the "amenities" of the place. Yet these are the very people who will not "let it alone," and who have for the past month been trying to select a site for the Duchess of Teck Memorial here. A wooden model has been temporarily placed in every conceivable position on the ridge of the Hill, on trial, and has justly aroused the anger of those residents of Richmond who, not having the peculiarly favoured opportunities for becoming versed in Art enjoyed by the average member of a Town Council, are exceedingly indignant that such a monstrously

find such a tribunal "must make up his mind that when he begins to select that tribunal every possible fault will be found with every selection that he makes, and whatever he proposes it will be pointed out that he has made the worst possible selection that can be thought of." Is there then no restraining force that can be applied to supercilious deans and experimenting decorators? We think there is, and that the force is public opinion. And for that reason we think the action of Lord Wemyss, though it failed in its immediate object will have done much good. Already the expression of public opinion in this very matter has proved to a certain extent effective. The Dean of St. Paul's, having relieved his feelings by administering a snub to the authors of the moderate and courteous memorial we referred to last week, proceeded at once to climb down—if such an expression may, without impropriety, be applied to a Dean. The first step was to accord a cordial reception to a Committee of

YORK STAIRS, THAMES EMBANKMENT. INIGO JONES, ARCHITECT.

funereal thing, resembling one of the familiar cemetery monuments from the Euston Road, should find a place on this spot to cut up the view. So widespread, indeed, is this feeling that probably this really wicked idea will be given up, and those who ought to know better be thus taught a much-needed lesson.

C. G. H.

### The House of Lords and St. Paul's.

THE EARL OF WEMYSS rendered a public service by initiating a debate in the House of Lords last Friday on the subject of the St. Paul's decorations. Lord Salisbury was perfectly right in meeting with a *non possumus* the question addressed to him. It is neither possible nor desirable that any government should constitute itself an arbiter on matters of artistic taste. We do not suppose Lord Wemyss will take up the Premier's challenge, and himself draft a bill for the establishment of a special tribunal to deal with these matters; such an attempt would be beset with difficulties, and would be foredoomed to failure. As Lord Salisbury wittily said: the man who would attempt to

the Royal Institute of British Architects, to whom he stated that the stencil ornament to which so much objection has been taken, is "largely experimental. The second step was to stop the stencilling altogether. Many must have read with pleased surprise the announcement in last Friday's "Times," that the stencilling of the stone surfaces has been stopped, by order of the Dean, until the decoration committee meets early next month. In view of the practically unanimous condemnation of this form of decoration we cannot believe that it will be resumed, more especially as Sir W. Richmond himself is stated to be but ill pleased with the result of his handiwork. As to the larger question touched upon by Lord Wemyss of the preservation of our cathedrals as a whole from the hands of unwise decorators and restorers, there again we shall have to look more and more to an enlightened and instructed public opinion. Our artistic and architectural societies might well exercise greater vigilance in these matters than they do at present, but something also is to be hoped from an increase of artistic appreciation on the part of that much despised person "the man in the street."

H. B. P.

# DESIGNS FOR A COUNTRY HOUSE. PREMIUMS DOUBLED.

The correspondence that has reached us since we first announced our intention of arranging a "BUILDERS' JOURNAL AND ARCHITECTURAL RECORD" COMPETITION, shows that the scheme has aroused a large measure of interest.

Many Architects of standing desire to participate in the Competition, and in order that those who compete may be adequately remunerated, we have decided to

**DOUBLE THE PREMIUMS** Originally Offered.

We, therefore, now announce that Premiums of

**TWENTY GUINEAS, TEN GUINEAS, AND FOUR GUINEAS**

will be awarded for the Three Best Designs for a Country House sent in to this Office in accordance with the Conditions set forth in our last week's issue (page 163).

## A FURTHER DEVELOPMENT

of this scheme—a Competition for the Erection of A VILLA ON THE RIVIERA—will be announced in the

**MAY NUMBER of "THE ARCHITECTURAL REVIEW."**

### On Reflection.

#### A Surveyor's Qualifications.

SOME remarkable proceedings at a recent meeting of the Heath Town Urban District Council are reported in a Wolverhampton newspaper. The Council met to elect a surveyor and inspector of nuisances; the salary was about £120 a year, and three candidates presented themselves. The first candidate (a young fellow of twenty-one) was called into the council room, asked a few unimportant questions, and then dismissed. The second candidate, Mr. Enoch Griffiths, on being asked by one of the councillors how he would test a manhole 36ft. deep before sending a man down, declined to answer on the ground that this was a technical question! Asked how he would test levels, he replied, "the same as any other man would test them." Had he had any experience in an architect's or surveyor's office? No; but he had studied sanitary questions. He admitted that it was the simplest thing in the world to ask him technical questions that he was not qualified to answer; but before he had served the public for a month he should be an expert. The third candidate, apparently, had not the same objections to technical questions, for he answered several satisfactorily. Nevertheless a majority of the Council favoured the grotesque candidature of Mr. Griffiths, who was accordingly elected by seven votes to three. The explanation is very simple: *Mr. Griffiths is a member of the Council.* We do not wonder that one of the three Councillors of Heath Town who do not believe in jobbery protested against the election, and threatened to communicate with the Local Government Board. We hope he will do so.

#### Fires in Tall Buildings.

THE recent fire at the Hyde Park Court Mansions has directed attention in a startling manner to the question of the best means of protecting tall buildings against fire. The best plan undoubtedly is not to build them at all; you cannot build a dwelling-house beyond a very moderate height without a loss of architectural proportion. But that, perhaps, is not the question. Cities are not built, unfortunately, on æsthetic principles. The desire to make every square foot of land yield as much rent as possible is responsible for the hideous "sky-scrapers" of Chicago and New York,

and would no doubt set English builders to work constructing similar monstrosities if the law permitted it. Without going to the American extreme, however, our architects have provided not a few hotels and blocks of residential flats of sufficient height, to make the question of the protection of life from fire in such buildings a very serious one. As was shown at the Hyde Park fire, our fire brigade appliances are not adapted for coping with fires in the upper storeys of "sky-scrapers." It behoves the architects and builders concerned in the erection of tall buildings that are to be used as dwelling-houses to pay the greatest possible attention to their fire-proof qualities. Of course, in the strict sense of the word there is no such thing as a "fire-proof" construction. The best of the materials and processes before the public are only to a greater or less degree "fire-resisting." Nevertheless, some of them are extremely valuable, and thanks to the efforts of the British Fire Prevention Committee, to whose useful testing work we have more than once referred, architects and builders are likely soon to have a mass of absolutely reliable data to guide them in their choice of fire-resisting methods and materials. In this connection it may be useful to mention a recent publication of the Committee, "The Tall Building under Test of Fire," which gives some very valuable and interesting information, illustrated by photographs, on the manner in which certain lofty American buildings have withstood or failed to withstand, the attacks of the fire fiend.

#### The Lame Horse Again.

A CORRESPONDENT, whose letter will be found in the Enquiry Department columns of the present issue, writes to ask us to explain the meaning of the Conditions of Competition issued by the School Board of St. Thomas, near Exeter, for the proposed new Board school at that place. We have been unable to explain the enigmas complained of by our correspondent with any exactness, but any humiliation which that inability may have aroused in the omniscient Editorial mind is cleared away by the perusal of a printed form of "Queries and Answers on Conditions of Architects' Competition," which has just been issued by the School Board, and reaches us as we go to press. By this it seems that the Clerk to the Board who drew the Conditions cannot settle the material issues raised by our correspondent, and to several of the twenty-five enquiries of frantic, tortured competitors, blandly replies: "This

clause might as well be withdrawn," or to that same effect. Yes, my good sir, but why delay this useful suggestion till a fortnight before the drawings are to be sent in? What we should fail altogether to understand (were not our experiences of Architectural competitions extensive and various), is why, when an assessor is appointed he should not be required to draw, or revise the conditions; and why an eminent architect should consent to assess under conditions drawn in a slovenly and ignorant manner. The primal necessity for the advice of an Assessor in this early stage of competitions is well exemplified by the last enquiry on the form to which we have referred. The competitors wish to know whether certain existing boundary walls involved in the design are good enough to serve, or whether they should be rebuilt. To which the Clerk: "These must be answered by the competitors themselves." Yes, my good sir, but St. Thomas is not near Exeter, and Exeter is not the hub of the universe. Do you expect your probable five score would-be competitors to travel severally from Brighton, Nottingham, or Durham on such an errand. An assessor could have supplied this essential piece of information. But although these very usual "Replies to Competitors" reveal frequently enough a lax forethought in the drafting of the conditions, they also exhibit a peddling, nervous attitude on the part of competitors which could never produce a worthy design, and should not exist. To succeed in a competition design is not to succeed in piecing together the requirements of the conditions like the parts of a puzzle. The only just cause for a man to compete, is that he has an idea, and it has been established many times over that the man with a sound idea may over-ride the letter of the conditions, and win success thereby. There is a great uproar when a competitor who has used brown ink instead of sepia (this is the subject of one of the enquiries before us) has his design placed, but if the design be selected for its genuine merit, it is in all interests surely best that this freedom in the interpretation of the conditions should exist. No one knows so much of the possibilities of the site, or plan, as those who make the design, and any limitations and restrictions of the committee or the assessor must in reason be subject to their always imperfect appreciation of the points on which ideas are sought by way of competition. For this reason we would prefer always to see such clauses of the conditions as refer to the design, set forth as suggestions only.

WILTON HOUSE, WILTSHIRE. THE CLASSIC FRONT ONLY BY INIGO JONES.

## SOME NOTES ON THE WORKS OF INIGO JONES.

BY H. INIGO TRIGGS, A.R.I.B.A.

(Concluded from No. ccviii., page 143.)

IN 1626, Jones designed the water-gate of Old York House, which was executed by Nicholas Stone; the gateway still remains in the Embankment Gardens, at the end of Buckingham Street; there has been doubt expressed whether Jones designed this gate, owing to a statement in the account book of works done by Nicholas Stone (Soane Museum) in which he says: "The water-gate att York House, he dessined and built;" by "dessined" he probably meant making working drawings, but judging from the work itself, there can be little doubt that it was designed by Jones, especially as there are drawings of it in existence bearing his name.

In 1620, he was made a member of a commission to enquire into all new buildings erected in London since the beginning of the reign of James I., and to enforce compliance with certain building regulations. He was also a member of a commission formed in 1620 for conducting the repairs of Old St. Paul's.

During one of the Royal Progresses in 1620 Jones was sent for by the Earl of Pembroke at Wilton, and "received his Majesties' commands to produce out of his own practice in Architecture and experience in antiquities whatever he could possibly discover concerning Stonehenge." The result of his inquiries appeared in a folio volume published three years after his death "from some few undigested notes" which Inigo had left behind him, and which Webb, who calls them such, had moulded together for the purpose of publication.

Inigo Jones declared Stonehenge to be a Temple, of the Tuscan Order, raised by the Romans, and consecrated to the god Coelus. One can hardly believe, considering his learning, that these were the actual views held by Jones, although in after years Webb, who was intimately acquainted with him, and should have known his views, thought fit to publish a "Vindication" when Jones' theories were so violently attacked. Probably Jones' position as a courtier, only too willing to uphold and enlarge on the views of the "wisest fool in Christendom," as his Royal master had been called, led him to express such an opinion.

The Chapel of the Infanta, at Somerset House, in the Strand, one of Jones' best works, was destroyed by Sir William Chambers when the present Government offices were erected on

the site of the Protector's palace. The Beaufort House gateway, also about this date, which was given by Sir Hans Sloane to Lord Burlington in 1740, is now at Chiswick House. Lord Burlington was a great admirer of Jones, and gave considerable assistance to Kent, when he published his designs. On either side of the great external staircase of his villa at Chiswick are two statues—the one of Inigo Jones, the other of Palladio, his great master.

Another gateway erected about this time—that to the Physic Garden, Oxford—is often wrongly attributed to Jones; it was designed and executed by Nicholas Stone. There are several buildings at Oxford attributed to Jones, amongst which are the vaulted staircase at Christ Church College, and the garden front to St. John's. The work at Christ Church has been attributed to him, simply because it was reported to have been done by a London architect named Smith; and Peshall, who made this report, is supposed to have been mistaken, and meant Jones.

The work at St. John's was first attributed to Jones by Heylyn in 1688, but there is only a vague tradition that he had anything to do with the building. There is no reference to him in the college books, whereas Lesueur, who made the excellent bronze figures, is mentioned, and it seems hardly likely that Jones, so steeped in Palladianism at this time, could have been responsible for the semi-Flemish detail of St. John's. He was little employed at either Oxford or Cambridge, and it is almost certain that the Christ's College Buildings at Cambridge are not by him.

In 1631 he commenced the Piazza and Church of St. Paul, Covent Garden, for the Earl of Bedford. The Piazza, which was never completed, was carried along the whole of the north and east sides, the church occupied the west side, and a grove of trees the south. The church was not consecrated till September 27th, 1638, when Juxon performed the ceremony.

When the Earl of Bedford sent for Inigo, he told him he wanted a chapel for the parishioners of Covent Garden, but added he would not go to any considerable expense, "in short, he said, I would not have it much better than a barn." "Well, then," replied Jones, "you shall have the handsomest barn in England." The building was of brick, with stone Tuscan columns to the portico, and a red tiled roof. In plan it clearly departed from ancient tradition, being a parallelogram 99ft. long, 48ft. wide, and 38ft. high. The roof was not supported by columns, and the church had galleries on all the four sides. The two disastrous fires which have occurred here have destroyed every vestige of Inigo Jones' work; but it is interesting as being

the first church on the new model of which galleries were to form an important part, and was one of the recognised models of ecclesiastical art in the two or three decades preceding the great fire.

St. Paul's Cathedral was in a sad state of decay, and Inigo Jones, who had been asked some ten years previously to report on the fabric, now joined the commission appointed in 1637 to further report. Both the King and Archbishop Laud were desirous that Jones should rebuild the whole fabric, but from the state of the exchequer this was impossible, and Jones was only able to proceed with the west portico. In considering this design one must not forget that the high gable over the portico was necessitated by the pitch of the nave roof, and on the completion of the whole building he would probably have altered the design. Laud succeeded in raising £101,300, and the works were begun in 1633; and continued until the outbreak of the Civil War, when the balance in hand was annexed by the Parliament. The works had now got as far as the south transept, when they were stopped. In order to improve the approach to the portico, the Church of St. Gregory by St. Paul's was marked out for removal by Jones. This greatly incensed the parishioners, who made every effort to preserve their church, and had the King's affairs been then in a more prosperous condition, he might have gained his point; but the parishioners laid their case before the House of Commons, who referred it to the Lords, adding a declaration that the parishioners deserved redress, and that proceedings should be taken against the King's architect for the demolition he had caused. Jones is accused by the parishioners of saying he would not undertake the repairs at St. Paul's "unless he might be the sole monarch, or have the principality thereof," a harmless charge, but interesting as confirming Jonson's satire.

He first pulled down a portion of the church, and then threatened "that if the parishioners would not take down the rest of it, they should be laid by the heels." The declaration of the Commons brought Inigo Jones before the Lords, when he pleaded not guilty; but the decision was against him, and he had the mortification of seeing his work at St. Paul's stopped, the materials remaining being given to the parishioners to rebuild their church.

In 1636-7 he was employed on the Barber-Surgeons' Hall, but none of his work there remains; most of the woodwork which he designed was sold in 1782. In 1637-8 he designed the choir screen, since destroyed, of Winchester Cathedral, and about this time also designed Shaftesbury House, Aldersgate Street.

The outbreak of the Civil War found other occupations for King and nobles than considering designs for palaces, and Jones, who, especially after the St. Gregory dispute, found London too warm for him, joined the King's forces at Basing House, near Basingstoke. Being now a man of considerable wealth, which he was obliged to hide, he, assisted by faithful Nicholas Stone, buried it in a private place in Scotland Yard; but finding this place too insecure, they removed the valuables once more, and buried them in Lambeth Marsh.

For many years the brave Marquis of Winchester withstood the efforts of the Parliamentarians to reduce Basing House, which was considered impregnable, until at last Cromwell became so incensed that he conducted the siege himself. Peake and Faithorn, the artists, and Hollar, the engraver, together with Inigo Jones, were taken prisoners; the latter, having lost all his clothes, was carried out in a blanket, but he was well treated, as he had a friend in one of the officers of Cromwell's army. For his allegiance to the King he was condemned in 1646 to pay a fine of £545, and a further sum of £500.

country. About 1647 he made additions to Kirby, much on the same lines as at Wilton, and also prepared designs for re-building Durham House, drawings of which, prepared by Webb, are in Worcester College. In the same year he added the west wing, with its great quoins, and projecting eaves to Cranborne Manor. Amongst other domestic buildings are works at Fort Abbey, Colehill, Castle Ashby, Northamptonshire, all of which were interrupted by the Civil War. His latest design was one for re-building the College of Physicians, dated 1657, and marked "not taken."

The latter part of his life is one of disappointment and anxiety. After Basing House, the office of surveyor was taken from him, but that had never been a very lucrative one. He survived most of the companions in art, the great patrons of his early life, and his royal master, who by the irony of fate was executed in front of the noble Banqueting House he had watched being built in his boyhood days.

Jones died, full of grief and misfortune, at Somerset House, in the Strand, June 21st, 1652, and by his own wish was buried in

tion not to be found in his great successor, Wren. He was a man of proud temperament, and commanding in manner, and this may account for the apparent ease with which he swept away the German influence and substituted the Classic styles, which were accepted by the best intelligence of this country for the next 150 years, and after a century's lapse again show signs of revival.

#### LIST OF INIGO JONES' WORKS.

- 1607—12. Charlton House, Kent, built for Prince Henry, west front afterwards by Kneivitt.
- 1607 (?) Bramshill, Berkshire, for Prince Henry.
- 1615—21. Houghton Hall, Bedfordshire, for Countess of Pembroke; porticoes copy of La Carita of Palladio. In ruins.
1616. Dorfield Hall, Cheshire, for Ralph Wilmham.
- 1615—36. Crew Hall, Cheshire; restored 1837, greatly burnt 1866.
- 1618—35. Aston Hall, Warwickshire, for Sir Thomas Holte.
1617. Star Chamber, design and model.
- 1617—23. Lincoln's Inn Chapel (Gothic); open cloister under it, estimated cost £2000.
- 1617—35. Greenwich, Queen's House, to cost £4000; now the centre of the the Royal Naval School.
1618. Lincoln's Inn fields laid out.
- 1619—22. Banqueting House, Whitehall, built for James I.; cost £14,940; restored 1831.
1620. Queen's Street, Lincoln's Inn Fields, and houses on the south side, having fleur-de-lis thereon.
1612. Beaufort House, Chelsea; gateway removed 1740 to Chiswick.
- 1622—23. New-hall, Essex; alterations to modern fashion for Duke of Buckingham, who bought it in 1622; house had cost £14,000 in building.
1623. Queen's Chapel, St. James's.
1625. Catafalque for funeral of James I.
1626. York Stairs.
1629. Holland House, Kensington: Piers to a gateway near the east side, carved by N. Stone. Cost £100.
1630. Rainham Hall, Norfolk, for Sir Roger Townshend.
1631. Covent Garden Piazza, for Duke of Bedford.
- 1631—38. St. Paul's, Covent Garden, Church, for Duke of Bedford. Cost £4500. Jones was present at its consecration.
1632. Sion House, Isleworth: Additions.
1632. Winchester Cathedral: Screen.
1632. Denmark (afterwards Somerset) House: Chapel for Queen Henrietta Maria, who "on Friday, September 20th, at eleven in the forenoon, with her owne handes, helpt to lay the two first square corner stones, with a silver plate of equall dimensions between them."
- 1633—49. St. Paul's Cathedral: Modernization of the transepts and nave and erection of the portico to west front, 200ft. long, 40ft. high, 50ft. deep.
1634. Tomb to Chapman, south wall of the Church of St. Giles's-in-the-Fields. At Jones's expense.
- 1636—37. Barber-Surgeons' Hall, Monkwell Street.
1637. Porch to St. Mary's Church, Oxford; for Dr. Owen, chaplain to Archbishop Land, cost £230, carved by N. Stone.
1639. Whitehall, general designs for new palace.
1640. Ashburnham House, Little Deans' Yard, Westminster; greater part burnt in 1731; two rooms, a staircase, and an alcove remain.
1640. Lindsey House, No. 59, Lincoln's Inn Fields, for Earl Lindsey.
- 1640—48. Wilton, Wiltshire, for Lord Pembroke.
1641. College of Physicians, Warwick Lane; buildings in the rear.

DESIGN FOR THE WEST FRONT OF OLD ST. PAUL'S.

After this stormy passage in his career he resumed work again unmolested, and to this period belongs his work at Wilton. Charles persuaded the first Earl of Pembroke to build the garden front, intending Jones to be the architect, but he being much engaged at this time on Greenwich and other works, suggested De Caux a Gascoigne, who eventually did the work. The buildings were burnt down in 1647, and were rebuilt from the designs of Inigo Jones, under the superintendence of Webb. The only work now remaining by him is the south block, but views preserved at Wilton show his whole design, which consisted of an oblong court and towers at the four corners, raised above the adjacent building. He preserved the sixteenth century gateway-tower on the east side.

De Caux's work on the east façade was allowed to remain. Fire eventually destroyed all Jones' work except the south block, which includes the suite of rooms on the first floor, now remaining much as he left them. The great room, a double cube like the Banqueting House, Whitehall, with a superb mantelpiece and panelling, is one of the finest rooms in this

St. Benet's Church, Paul's Wharf, by the side of his father and mother.

Brympton Manor House, a few miles from Yeovil, was erected during the reigns of Henry VII. and Charles II. The garden front was ascribed to Inigo Jones by Horace Walpole. Whether the work was carried out under the architect's supervision or not is a debateable point; what evidence is obtainable tends to support the theory that Jones only furnished the design, the work being carried out under the superintendence of a pupil. There is some similarity between the garden front of Brympton and that of Hinton St. George (also attributed to Jones), the seat of Earl Poulett, situate not many miles away.

There are two portraits of Jones existing by Vandyck, who was his friend during many years of his life. One of these is now in the National Portrait Gallery.

Inigo Jones was one of the most accomplished architects this or any other country has produced, no man ever mastered more completely the difficulties of his art. He had naturally a wonderful artistic feeling and sense of proportion, together with an imagina-

 " Oatlands, Berks, gateway to the old palace, since removed and repaired.

## SOME OLD SCOTTISH TOWERS.

BY BULKELEY CRESSWELL.

(Illustrated by WILLIAM BEVAN.)

THE three curious old towers which are illustrated in our supplement plates, all belong to the neighbourhood of Edinburgh, and quite apart from their historic associations, or their remarkable qualities of the romantic and the picturesque which have been so skilfully presented in Mr. Bevan's clever drawings, they have a peculiar attraction for architects in the quaint and individual architectural character attaching to each. Indeed, this group of towers is in a manner unique. It is essentially local, and it may be described as indigenous, for though there is no question that these designs are due to Dutch influence,

Musselburgh evidently had no shame of her origin, and this is well, for it was by fish also that she came by her clock tower, or "Knock Hoose" (as it was once termed). The clock is dated "1497," and there is evidence to show that it was a gift to the town from the Dutch States; and it is generally supposed that Musselburgh acquired the distinction of a clock, which is now one of the three oldest serviceable turret clocks in Great Britain, by virtue of her herrings. The Dutch, always notorious in the Middle Ages as a maritime nation, were at that time adepts in curing the fish, and it was through following the shoals into Scottish waters that they came to value the good fellowship of Musselburgh folk and woo their favour. A "A Knock Hoose" was a proud distinction to a township in those days.

The "Municipal Buildings," as the block is now called, which include Town Hall, council chamber, town clerk and chamber-

BRYMPTON HOUSE, SOMERSETSHIRE. ASCRIBED TO INIGO JONES.

- " Ascot House, Bucks, "a noble room" for Sir W. Dormer; pulled down 1720.  
 " Cobham Hall, Kent, for Duke of Richmond and Lennox, central portion of front and a ceiling.

**SS. Michael and All Angels' Church, Sheffield,** has just had the chancel paved with black and white marble in memory of the late vicar, the Rev. T. Wilkins; also a marble tablet in his memory, has been executed by Mr. Fred Wilkins, sculptor.

**A New Chapel at Morrision** has been erected for the Welsh Calvinistic Methodists. It is built of native stone, and is 52ft. by 42ft., and has accommodation for 500 persons. The contractors were Messrs. Thomas and Jones, of Morrision, and Mr. W. W. Williams, of Wind Street, Swansea, was the architect.

the respective buildings themselves are the work of the people, and not ascribable to professed students of what, in those days, was considered the anomalous Continental styles.

Musselburgh is a small township now almost merged with Portobello, a suburb of Leith and Edinburgh. It is built near the mouth of the River Esk, and owes its origin and its name to a "broch" or bed of mussels at the mouth of the river, and the urban patriotism which in these days reaches fever heat between the cities of Leith, Edinburgh, and Glasgow, existed also in these early times, for there is an ancient doggerel which, by an ingenious punning on the word "broch," a synonym for a bed or bank, and a burgh or township, ascribes to Musselburgh a greater antiquity and a priority over Edinburgh, thus:—

Musselburgh was a broch  
 When Edinbroch was name;  
 And Musselburgh shall be a broch  
 When Edinbroch's gane.

lain's offices, also constabulary quarters and police station, were not all built at one date. Besides the tower already referred to, the mediæval portion, once used as a gaol, was not built till the end of the sixteenth century. There existed at that time in Musselburgh a religious establishment called the Chapel of Loretto belonging to the Abbey of Dunfermline, and the gaol was built of the material from the chapel, which was pulled down in accordance with the precepts of the Reformation. It is said that pilgrims who were wont to worship at the chapel, after its demolition worshipped at the new gaol in which its stones were incorporated. That portion of the block to the right of the drawing, which is manifestly of a later design, is contemporary with "New" Edinburgh. The date inscribed within the entrance porch is "1773," and the style of the building is similar to that of the Edinburgh city cham-

bers. The material of which the picturesque old pile has been built is that cold grey stone which those who know Edinburgh and its environments learn to love so well. The roofs are slated, and so also is the whole of the old spire—the central and most curious feature of the building. This type of spire—a slated spire tapering at several changing inclinations of pitch, and with a projection of the upper slopes over the lower, forming small eaves, under which a moulding is often put—is the most distinctive and characteristic feature of mediæval towers throughout Scotland, which follow Continental rather than English traditions.

The curious shallow wooden cornice, like a hat-brim, is unusual; but grotesque as it is from a critical architectural standpoint, it has its purpose in the design by covering the weak transition from square to octagon, and no one who has seen it would wish it otherwise. It is the salt of the composition; it draws out its full flavour, and emphasises the individuality which belongs to the whole. It advertises also the origin of the design, but with a candour that is perhaps a little too frank. Musselburgh is not of Holland, indeed, it is very much of Scotland, for the country all about is loaded with historical associations. From the day when Alexander II. camped on the northern bank of the Esk near this spot, and made so brave a front to King John's punitive army that he thought better of his enterprise and beat a retreat, the country round Musselburgh has been continually trodden under the feet of the invading armies of Scotland and England, and several momentous battles have been fought in the neighbourhood. In 1567, Musselburgh saw the first act in the tragic fall of Mary Queen of Scots. It was here that her forces met the army of the confederate nobles, and here, after a day's manœuvring and treating, during which Bothwell—her newly-wed husband and Darnley's murderer—challenged her accusers to a single combat, which the Queen would not permit, she surrendered. Pinkie and Prestonpans were fought close to Musselburgh, the former battlefield being but a mile distant, and Comerell's army camped here after Dunbar. Old Pinkie House, which stands to the east end of the town, once sheltered Charles Edward. Indeed, the whole neighbourhood has been trod by the march of armies throughout history; for this zone of country, lying immediately south of the Scottish capital, saw the departure towards England of invading or defending Scottish armies, and was the approach by which the English forces sought to gain the capital; while, in later troublous times, it was along this coast that the Dutch and French ships held on and off to succour this party, or that, in the cause that held the country under arms for the time being.

Of the Jacobite and Covenanting risings, Musselburgh must have seen much, and the old Knock Hoose seems to convey, in its time withered walls and warped spire, a reminiscence of the scenes of triumph and desperation upon which it has looked forth; and stimulates the imagination to picture the rude, impassioned soldiers who marched out to forward Cromwell's cause, and as readily marched forth to overthrow him when, in his success, he fell away from those principles of liberty for whose advancement they had armed themselves. The grey-green slates which have in places faded almost to the colour of oak shingles; the grey stained and time-scarred walls; the slightly sunken and twisted outline of the roofs; the deep worn thresholds where innumerable mail-shod feet have trod; and the stone door-jambs worn smooth by the recurrent passing touch of the fustian and brocade of many centuries—all these things unconsciously yield their subtle aid in forming a picture of whose charm a man might travel far to find the equal. For the old building has no rival here; there is no other edifice that would usurp its modest dignity. The unassuming dwellings of the townspeople, grey, and of a retiring simplicity, stand all about; and around the wide, irregular-paved market square of the town (which gives an impression as though the houses had fallen back out of rank to make an open space), there is no

obtrusive or garish imposition of modern building craft to mar the harmony and simple completeness of the little Musselburgh town, clustering about its "Knock Hoose," where a bell is still rung morning and evening, in conformity with some custom of long ago.

In the old tower of Queen's Ferry the reader will recognise a close affinity to that just described; like it the design is of Dutch origin. The tower is square, plastered with strong yellow stucco, with worked stone quoins, strings, and dressings. The terminal portion is slated. It is of a later date than the Musselburgh tower, but of the same local and indigenous origin. South Queensferry, with its narrow winding streets and plain-fronted grey stone houses—over which Sir Walter Scott in "The Antiquary," and R. L. Stevenson in "Kidnapped," have cast the glamour of romance—is not attractive to the visitor, save for its interesting historical associations, and a certain particular air about its modern squalor, as though it had an ancestral legacy to be upon that spot, and as though the shabby houses were each an equivalent for others that once occupied their site and mapped and enclosed the crooked dingy street long ages ago. Queensferry is at the narrowest convenient point on the Forth accessible from Edinburgh, and thus it must, from immemorial time, have been a ferry and a wayside halting-place, and the plot of close-clustered houses upon the shore of the Forth, which constitutes South Queensferry, emphasises its origin. The ferry still plies backward and forward from north to south shore of the Forth, but now it is a steam one; the little ship runs to and fro upon its ten furlong voyage, under the shadow of the great Forth Bridge, whose structure almost blots out Queensferry to the casual eye, dwarfs the hills on either shore, and leaps the waters of the Forth, upon which the little steamer laboriously throbs its course, in three giant strides. What would Oliver Cromwell have thought of it had he found it there when he crossed the Forth upon his primitive expedition in 1651? Is it not probable that when he had assuaged the panic in his army, and had collected and reassured his forces, his scorn and horror of all kinds of profanity would have prompted him to return and pull the bridge down?

The last of these towers which Mr. Bevan has drawn, and perhaps the most curious and interesting of them all, is that of the parish church at Burnt Island. It is on the northern side of the Forth, some few miles east of North Queen's Ferry. This church has no parallel in Scotland. Its design differs entirely from that of any other parish church, and it has been supposed that the idea was taken from the North Church of Amsterdam. The church stands on rising ground on the south side of the town, and was built between the years 1592 and 1594 by the inhabitants of Burnt Island. It is square on plan, with buttresses set diagonally at the four corners, and the tower rises from four piers. In this anomalous plan we may trace the reaction against Romish traditions, and the enthusiasm for the new doctrines which John Knox and other pioneers of the Reformation had at that time engrafted among the Scottish people; and so effectually was the arrangement of this building opposed to the ceremonial of the Roman Church that when Archbishop Laud visited Burnt Island in 1633 he was much perplexed and exercised as to where the altar should be put. It was in this church in 1601 that James VI. took those vows as a Covenanter which but a few years after, as King of England, he was to set aside in the interest of that policy which, under later monarchs, bred such bloody deeds of oppression and resolution. Burnt Island, too, saw something of the Jacobite rising of '45, when nearly 4000 Hessian troops encamped near the town. The church accommodates only some 900 persons, and, except for the curious tower, is lacking in architectural interest. The tower itself cannot be considered a successful design. The mind never grows inured to the distressing effect of the heavy stone-work superimposed upon the slated roof, but in its conspicuous position upon the Forth it is a picturesque and well-loved landmark, while as one of the earliest buildings under the first

Covenant it is a monument to an epoch in Scottish history which produced one of the most devoted and whole-hearted struggles for freedom and intellectual liberty which the world has seen.

### EFFLORESCENCE ON TILES.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—Your enquiry column of last week has an enquiry re the "Efflorescence on Tiles." I think this arises from the cement, and if "Subscriber" will have the tiles washed a few times with soft soap, and, before dry, rubbed over with skim milk, it will not only remove any efflorescence, but will greatly add to the beauty of the tiles, bringing up the colours, and giving a glossed finish to them; in fact, all tile floors are very much improved by this treatment. F. S.

Hull.

### MAKING BLUE PRINTS.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—As a further supplement to the information given by G. A. T. M. in your issue of 5th inst., page 133, also by A. D., 19th inst., page 164, the following may be useful to "Bricklayer."

Put 1oz. of citrate of iron and ammonia, 1oz. of red prussiate of potash, and 8oz. of water, into a dark-coloured bottle, and shake well for about ten minutes, when the crystals will be dissolved. Keep this in a dark or shady place when not in use. Lay your piece of unglazed paper *rather strong* on a smooth board, pour a little of the solution into a common plate, and apply a good even coat to the paper with a soft brush; pin the paper to a board by two corners, and stand in a dark place to dry for an hour. This solution will last for several months, giving capital results; this is my experience. The printing and washing can be done as described by G. A. T. M.

JOHN WORNELL.

Wandsworth, S.W.

### WOODEN BEAMS.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—I think the writer of the article on "Wooden Beams" in your issue of April 12th fails to master the subject upon which he ventures to write. Imagine the tentative rule of thumb manner in which he tries to arrive at the section of an ordinary wooden beam. One size must be assumed, he tells us, and if that size happens to work out to a very badly proportioned beam, his only alternative is to try, try, try again.

Although I, in my turn, may be the subject of criticism also, I venture to show him how I should do it.

Suppose a distributed load of 200 cwt. is to be carried safely over a span of 20ft., the ends of the beam being *fixed*, to find the scantling of the beam.

200 cwt. safe distributed load =

100 cwt. safe central load, which, if multiplied by five as factor of safety = 500 cwt. breaking weight in centre.

The depth should be to the breadth as seven is to five, as this gives the strongest beam, therefore  $b = \frac{2}{3}d$

$c = 6$  for fir ends *fixed*.

$l = 20$ ft.

$W = 500$  cwt.

Then:  $W = \frac{c b d^2}{l} = 500 \frac{6 \times \frac{2}{3}d \times d^2}{20}$

$\frac{2}{3}d^3 = \frac{500 \times 20}{6} = 1666.66$

$d^3 = \frac{1666.66 \times 3}{2} = 2500$  (about).

$d = \sqrt[3]{2500} = 13\frac{1}{2}$  in. deep.

$\frac{2}{3}$  of  $13\frac{1}{2}$  =  $9\frac{1}{2}$  in. breadth.

Beam  $13\frac{1}{2} \times 9\frac{1}{2}$ .

D. FORBES SMITH, A.R.I.B.A.  
Kirkcaldy.

## Enquiries Answered.

The services of a large staff of experts, including all those engaged on "Specification," are at the disposal of readers who require information on architectural, constructional, or legal matters. Questions should in all cases be addressed to the Editor.

### BOOK ON ESTIMATING.

To the Editor of THE BUILDERS' JOURNAL.  
BRIDLINGTON.

DEAR SIR,—I should be obliged if you could give me a little advice as regards estimating. I wish to know the proper method of calculating the cost of erecting ordinary villa residences, &c., as regards excavating, concreting, brickwork, joiner work, plastering, painting and glazing, and slating and tiling, &c.

BRICKLAYER.

"Estimating," by George Stephenson, price 6s. 6d., published by B. T. Batsford, 94, High Holborn; London, is a book that will suit your purpose. But the prices in this, as in all other books on the subject, will need to be modified in accordance with the prevailing local prices.

### SANITARY INSTITUTE EXAMS.

To the Editor of THE BUILDERS' JOURNAL.  
PUTNEY.

DEAR SIR,—Can you give me some information on the best books for preparing for the examination for the Sanitary Institute? And what routine or exams. have I to pass to become a member of the Institute? and also a member of the Institute of Civil Engineers?

A. O.

Write to the Secretary, Sanitary Institute (Parke's Museum), Margaret Street, London, W., for the Institute's pamphlet (price 6d.), which contains particulars of exams., old exam. papers, list of Acts with which candidate must be conversant, and much other useful information. There are two exams. held under the S. I.—(a) Inspector of Nuisances; (b) Practical Sanitary Science. The latter part of your question is answered by the reply to "Surveyor," in our last week's issue.

### BOOK ON MEDIAEVAL AND RENAISSANCE ARCHITECTURE.

To the Editor of THE BUILDERS' JOURNAL.  
CARDIFF.

DEAR SIR,—Will you kindly oblige me by letting me know the best book for a probationer of the R.I.B.A. to obtain on the history of Mediaeval and Renaissance Architecture, one of the subjects in the Intermediate Exam.—Yours faithfully, "PROBATIONER."

If you intend to take up the course of examinations to qualify for election as associate of the R.I.B.A., it is essential that you should get a copy of the "Calendar," price 2s. 6d., from the Secretary, R.I.B.A., 9, Conduit Street, Hanover Square, London, W. In the Calendar you will find a list of the books which are suggested as being useful to those intending to take part in the examinations. T. R. Smith's "Gothic and Renaissance Architecture" is a standard book and covers the subjects you ask for.

B. C.

### MEXICAN ARCHITECTURE.

To the Editor of THE BUILDERS' JOURNAL.  
BIRMINGHAM.

DEAR SIR,—Could you inform me through the columns of your estimable paper, why it is that we have no record concerning the style of Architecture found in Mexico, as we read of large and beautiful cities there, even before its inhabitants were conquered by the Spanish?

—Yours truly, A. J. W. B.

You are wrong in supposing there are no records of Mexican Architecture. The subject of the early civilization of Central America has been one which has specially attracted the antiquary and archaeologist. It is incorrect to speak of beautiful cities existing even before the Spanish conquest; for it was the systematised destruction by the Spanish of all relics

of the indigenous races of Mexico that has left so much to be conjectured upon the subject. Under Cortes the native history of Mexico came to an end. The architecture, of which ruined specimens remain, shows high blocks of stone, vast schemes, ingenious adaption of wood forms in stone, and spirited carvings of high decorative merit. In Vol. I. of Fergusson's Handbook you will find some references and comparisons; and other well-known books are: H. H. Bancroft's "Native Races of the Pacific States of North America"; A. Prescott's "History of the Conquest of Mexico." In D. Charney's "Cities and Ruins of America" you will find the most exclusive architectural information.

B. C.

### COMPETITION FOR BOYS' SCHOOL.

To the Editor of THE BUILDERS' JOURNAL.

BRIGHTON.

DEAR SIR,—I shall be greatly obliged if you will kindly assist me as to the meaning of one of the conditions of the competition for a boys' school at St. Thomas's, near Exeter.

Having written to the clerk to the School Board asking for information, I get a reply, that "you must put your own construction upon the conditions." Having exhausted all my friends' (architectural) reasoning and my own I now appeal to you.

The condition referred to is as follows: The accommodation to be provided is for 600 boys (seated at dual desks), on two floors, and arranged as follows:

$$2 \times 90 = 180$$

$$4 \times 80 = 320$$

$$2 \times 60 = 120$$

620

What does this table mean? Please note that the total of the table is 620. Although

in the previous paragraph it gives 600, which latter amount is supported by a later clause of the conditions which gives the cost per head the total amount of which works out at 600.

If, as at first glance appears, the first column means classrooms and the second accommodation, then it is altogether contradictory to the educational code (to which the plans are to conform), which states that for classrooms having accommodation for more than sixty, Rule II. (of the code) shall apply. By this rule classrooms are classed as school-rooms, and it is further stated that no school-room that is not lighted from at least three sides can be passed.

Now it is simply impossible to plan a school on two floors with six classrooms each lighted from three sides. A central hall is to be provided. Mr. E. R. Robson, F.S.A., is assessor. Under the circumstances what would you advise?

A COMPETITOR.

From the information you give the conditions would seem not to have been drawn by the assessor but by the clerk to the Board. The table seems to indicate the number of rooms and the accommodation required for each. This shows eight rooms distributed on two floors, and we do not understand your reference to six rooms. Unless there are other restrictions of which you have not told us these eight rooms could be lighted from three sides as indicated in the accompanying sketch. If however you are clearly satisfied that the conditions are incompatible with the code, you should write to the assessor, to the chairman of the Board and the local press, briefly pointing out the absurdity. The discrepancy between the 600 and the 620 need not trouble you. If your plan and elevation please the

Board, neither it nor the assessor would disqualify you on such a narrow margin of accommodation. You can give an alternative price. Use your gumption; if you have a good idea don't let the conditions balk you of it. Remember that conditions state what is wanted not what can always be provided, and very few competitions are unincumbered by some such contradictions and impossibilities as those which appear in this case.

### SIZE OF BEAMS FOR CONCRETE FLOOR.

To the Editor of THE BUILDERS' JOURNAL.

EDINBURGH.

DEAR SIR,—Would you kindly inform me what size of beams would be required to carry a concrete floor over a 16ft. span? Mitchell's "Advanced Building Construction," says at page 336, "for spans of 16ft. opening, about 2in. by 4in. are placed about 2ft. apart from centre to centre," &c. It seems to me that this is too light, as a 2in. by 4in. would sag with its own weight on a span of 16ft., and it would be impossible to have a rigid and level floor. The floor area each beam would have to carry = 16ft. by 2ft. = 32ft., and this at 2cwt. = 3½ tons. Now a 4in. by 2in. will only carry 1 ton. I should be much obliged if you would explain this.—Yours faithfully,

"BREEZE."

Much depends upon the composition and strength of the concrete. Omitting this entirely and taking "Breeze's" calculation of 3½ tons distributed load, the stress becomes (assuming depth of joist at 7½in.):

$$s = \frac{WC}{8d} \text{ by formula} = 10\frac{1}{2} \text{ tons stress in flange.}$$

This would require 2½ square inches of metal in sectional area, so that a joist for this span and load should be about 2½in. by 7in.

### FACTOR OF SAFETY FOR WOODEN BEAMS.

To the Editor of THE BUILDERS' JOURNAL.

NEWMARKET.

DEAR SIR,—Will Mr. Charles W. Tomlinson further explain if in finding the size of beam and taking the factor of safety at 4; he considers this right for a live or dead weight; if dead is it for permanent or occasional load? Some authorities give as little as ½th of breaking weight for safe load? Will this method do for joists, and won't building-in the ends make them carry much more?—Yours faithfully,

J. S. P.

The factor of safety (4) used in the article on Wooden Beams, is suitable for simple dead load. If the beam were liable to a live load the f.s. would of course be higher. Whether the load is permanent or occasional is not taken into account, as no difference would be made in the f.s. as long as the load is dead. As to the high factor of safety (10) mentioned by J. C. P. in Rivington's "Building Construction," Vol. III., a table is given in which 10 is mentioned as a suitable f.s. for cast iron columns, subject to a transverse stress, but I have not heard of 10 being used in the case of beams subject to a common dead load. For joists, &c., 4 is a fair average factor of safety. A beam is usually taken as being merely supported at each end, but if the ends of the beam are solidly built in to the walls it would then become what is called a "fixed beam." In this case Molesworth gives the strength as one and a half times that of the ordinary supported beam.

CHARLES W. TOMLINSON.

### Church Extension at King's Norton.

The completion of Stinchley Church is promised by Mr. T. Smith, the builder, by the end of January, 1900, and the completion of Cotteridge Room by early in May, 1899. £7,462 has now been raised for Stinchley Church, and £2,424 for Cotteridge Room, leaving £400 to £500 still required. The Birmingham Church Trustees have granted £2,500 towards the erection of Cotteridge Church, which is to contain space for 1,000 worshippers. Mr. W. Hale is the architect.

## THE ARCHITECTURAL ASSOCIATION THEATRICALS.

THE ARCHITECTURAL ASSOCIATION held its annual *soirée* last Friday night at St. George's Hall, Langham Place, at which a musical play in two acts, entitled "The Druids' Elect: an Episode of the Ancient Britons," was given. It was written by Messrs. G. B. Carvill and Gervase Bailey, and the music was by Mr. Leonard Butler. On the previous Wednesday evening a dress rehearsal (ladies' night) of the same play had been given.

The principal characters were Lucius de Rougepot, alias Greennus (Archdruid and adventurer, and an excellent caricature of the notorious M. Louis de Rougemont), Mr. H. Passmore; Ashlar and Rubble (ancient Britons, candidates for the Council), Mr. A. Stalman and Mr. G. B. Carvill; Owen Rent (First Druid), Mr. F. Carvill; Rodesius (general in command of the Chartered Company's forces), Mr. F. D. Chapman; Superfinus (a lieutenant), Mr. S. Constanduros; Pennialinus (a correspondent), Mr. G. Bailey; Architopius (an architect), Mr. F. Foster; Coplinus (with the Chartered Company's forces), Mr. J. H. Wilson; Letitia (a Roman lady of uncertain age, betrothed to Superfinus), Mrs. A. Stalman; Ellalyn, Lettilyn, Gwendolen, Gwynne, Lyllien (British maidens), Misses Ada Yerbury, K. Rimell, Blanche Selig, Dolly Jennings, Ethel Atkins; and Blodwen (Ashlar's daughter), Miss Sophie Tyler. The chorus of Druids, Romans, and British maidens, was formed by twenty ladies and gentlemen.

The curtain rose on a scene representing sunrise in an oak forest and the picturesque entrance of a body of Druids. The first Druid referred to an election to the council, owing to the death of the lamented Stucco. There were two candidates for the vacancy, well known and respected architects, Ashlar and Rubble, who came forward with a copy of a professional journal of the time, called "The Antediluvian Advertiser and Neolithic News," which contained an article on the merits of both candidates, each of whom on scanning it found he had an important engagement to keep. The claims were set forth in the following manner: "Ashlar for art; Rubble for Reform. Britons be bold. Back the best builder and beautify Britain." Rougepot, who had been appointed on his own nomination to the post of Archdruid, then came on the scene, carrying a lyre, to the last bars of "The Wearing of the Green." He announced a very startling piece of news, which was to the effect that a party of Romans under Rodesius had landed with the idea of civilising Britain. Archdruid Rougepot then sang a ditty entitled "Limited," which explained the object of "The Roman Chartered Company of Great Britain Limited," and during the singing the rest gently left the stage. Directly after his song was finished Ashlar appeared to consult the Archdruid as to his chances of succeeding at the election, and the cunning Rougepot told of a vision in which he was visited by fifty kings—sovereigns—from the east, and asked Ashlar if he could do the translation; but Ashlar refused to give the bribe. When the ruse was fired on Rubble—although the bait was raised to eighty sovereigns—he promptly gave him the required sum. The Arch one explained that, although he could not influence the election, if Ashlar won the day perhaps he could induce him to retire by announcing that his daughter must be sacrificed to the gods as a thank-offering. This little affair having been satisfactorily settled, they retired, and the British maidens appeared on the scene picking May—during which happy pastime they were surprised by the Romans, and a pretty flirtation between Superfinus and the beautiful Blodwen took place.

The second act depicted sunset outside the council cave, and a chorus of girls sang a "May Day" song, and discussed a project of emigrating to a land where females' rights

would be recognised, in fact, where woman would be ruler, and bragging, cowardly man would only be permitted to live in slavery. Rodesius performed a stone-laying ceremony with an extraordinary trowel about the size of a man, and some curious drawings by Architopius were shown, among which was one of Vauxhall Bridge. One of the characters said, "That's what they call Cyclopean architecture, ain't it?" "No; County Council architecture," was the reply. The Romans informed their British friends that an institute had been formed at Rome for the teaching of elementary architecture, and some funny verses were sung called "The Institute at Rome," of which the following is a specimen:

The students went in four by four; when asked to describe a fireproof floor,  
Said "A thing that falls down on the Salvage Corps"

At the Institute at Rome.

Rodesius sang a song called "Simplicity," and the following is a verse taken from it:—

The art of modern architects is tending towards the plain

We build for Truth and Beauty and not for worldly gain,

If you want to build a house that will the tongues of critics stop,

Put four bare walls with windows like a warehouse or a shop,

And a fat unwieldy drain-pipe from the bottom to the top;

Oh the simple simple-maniac has got us in his claws,

He'll soon dispense with windows, and he'll do away with doors,

We'll return to what we were before the dawn of history's page,

And we'll play the noble savage in the Neolithic age.

After this pleasant interlude, Rougepot dismissed the assembly until the next day, when the sacrifice was to take place. Meanwhile it was decided by Blodwen and Superfinus that they should fly together, but this turned out to be an unnecessary step, as Rodesius came on the scene, and, in a parody on Marc Antony's oration, denounced Rougepot and Rubble, and these two were likely to have been killed by the infuriated Druids, Romans, and Britons if Rougepot had not thrown off his disguise and revealed himself as the long-lost Greennus, Letitia's first love, who disappeared after floating a new diving apparatus, which eventually sank. This revelation saves him, and the result is that everything ends happily.

The whole play was bright and witty, and a perfect success. Every character was word-perfect. The songs by Miss Sophie Tyler and Mr. S. Constanduros, as well as those by the others, were enthusiastically encored in every case. At the conclusion of the play there were loud cries for the authors, who appeared and bowed their acknowledgments. The actors and actresses also responded to calls. Mr. G. H. Fellowes Frynne in a few sentences complimented the actors on the manner in which the play had been performed. He said that he had been asked a question by one who had witnessed the play, and he supposed it was intended as a compliment to the gentlemen who had taken the different characters. The question was, "Why do these gentlemen spend their energies on Architecture?"

**Glasgow Hospital Accommodation.**—At a meeting of the Parish Council of Glasgow, the House Committee submitted a report on proposed extended hospital accommodation, in which it was stated that at present the accommodation available was insufficient. Dr. Bruce submitted a resolution, which was passed, to the following effect: "The House Committee under the remit from last meeting having now reported that new hospital accommodation is desirable, the Council, without committing itself at the present stage to the recommendations of the committee, remits the whole question of indoor accommodation to a special committee of nine members to consider whether a large general hospital, district hospitals, or a combination of both would be best suited to the requirements of the parish, and to report with reasons."

## Views and Reviews.

### AN ELECTRICAL DIRECTORY.

We have received a copy of "The Universal Electrical Directory for 1899," and must say that it fully justifies its title, for as a directory of the members of the electrical and allied industries throughout the world, it seems to be remarkably complete. It is divided into four sections, viz.—British, American, Continental, and Colonial. Each section is devoted to an alphabetical list of electricians and those connected with the trade, and also a classified list of the trades. At the end of the work is a British geographical division, which enables the searcher to find at once the town he desires, and the names of the firms connected with the trade situated there. This is a very useful feature of the book, as is also the incorporation of telegraphic addresses and telephone numbers with the ordinary addresses. The book this year has nearly two thousand more names than that of 1898, and altogether contains the names and addresses of over 25,000 firms. The simplicity of its arrangement, and the low price at which it is sold, should make it the desk companion of all interested in the trades it concerns.

The Universal Electrical Directory (J. A. Berly's), 1899. Price 6s. London: H. Alabaster, Gatehouse, and Co.

### THE DOWDESWELL GALLERY.

The exhibition of works by Elihu Vedder the honoured American artist, remains open until the third of next month, and it is hoped that many will see it. The special attraction, because "Omar" is so much talked of at present, is doubtless the collection of drawings which went to the making of the first illustrated edition of Fitzgerald's immortal quatrains, and because these drawings are classic in point of style, they are likely to hold their ground as long as the fame of the translator endures. It is probable that the artist's almost absolute knowledge of certain typical forms is due to his long sojourn in Rome, and consequent familiarity with past-masters of Classical Art. The influence of Michelangelo being unmistakable, one cannot help wishing he had not been imitated, as in the "Sibyl." With a view of forestalling another, I hazard this one remark, but for the rest I would have it observed how essentially monumental, and by inference decorative, the majority of these things are. Even paintings which an artist already secure of fame ought not to have exhibited here, will be found to possess a singular power when the spectator is far enough from them. "Whatever the hand may have done, the mind has done its part" said Johnson of Barry's show. It should be explained, as it may give an idea of their importance that the figures in some of these designs are of more than life size *in situ*.

E. R.

**Colne Baptist Church.**—The memorial stones of the new schoolroom and classrooms which are being erected in connection with the Baptist Church have been laid. The new buildings are expected to cost about £400.

**Stanford-le-Hope Sanitation.**—At a Local Government Board inquiry, conducted by Colonel Slacke, R.A., into the question of a drainage scheme for the parish of Stanford-le-Hope, the Rural District Council surveyor said that at present seventy-five houses were connected with a sewer, but the remainder were drained by cesspools. At the outfall of the sewer there was a set of tanks for treatment of the sewage by aluminiferous, the effluent going into a tidal ditch. The water supply was obtained from several wells in the village, and water mains had been laid by the South Essex Water Company, but they had not yet turned the water on. A scheme was detailed which would deal with a population of 3,000, and include parts of Horndon and Mucking. The sewage would be treated by two septic tanks and biological filters at the outfall into Mucking Creek. The estimated cost of this was £3,346, exclusive of the purchase of land and easements.

## Bricks and Mortar.

EFFINGHAM HOUSE, ARUNDEL STREET,

April 26th 1899.

"I know what it is to live in a cottage with a deal floor and roof, and a hearth of mica slate; and I know it to be in many respects healthier and happier than living between a Turkey carpet and a gilded ceiling, beside a steel grate and a polished fender. I do not say that such things have not their place and propriety; but I say this, emphatically, that the tenth part of the expense which is sacrificed in domestic vanities, if not absolutely and meaninglessly lost in domestic discomforts and incumbrances, would, if collectively offered and wisely employed, build a marble church for every town in England; such a church as it should be a joy and a blessing ever to pass near in our daily ways and walks, as it would bring the light into the eyes to see from afar, lifting its fair height above the purple crowd of humble roofs."—JOHN RUSKIN.

### Amiens Cathedral.

NORMANDY and Picardy are rich in ancient and beautiful buildings, and not the least interesting of them is the noble cathedral of Amiens, the ancient capital of Picardy, an illustration of which is given in one of our inset plates. The cathedral was built during the period between the years 1220 and 1280. Of the mass of old houses which formerly surrounded it, many have now been removed—with some loss of picturesqueness—to make way for more convenient dwellings. Our sketch has been taken from the water side, and gives a comprehensive view of the old town and cathedral.

### Disappearing Aberdeen.

CERTAIN buildings in what is known as the "Exchequer Row Area," Aberdeen, are to be demolished, as the quarter is considered to be unhealthy. The Exchequer Row is a narrow thoroughfare, leading from the south-west corner of Castle Street to Shiprow, and its name is derived from the fact that in the time of William the Lion, King of Scotland, a Royal Exchequer Mint existed in the quarter. All traces of the old building are lost, but it is said that there can be little doubt that the existing old building at the south end of Exchequer Court is the Exchequer House subsequently erected on the site, and the initials "V.R.," found on an old oak panel removed from the interior, and presented to the Marischal College, are, perhaps, those of William Roland, who was the master of the Aberdeen Mint in the time of James V. The Bursar's House, which is on the south side of Castle Street, has a rather interesting history. It is said that Mary Queen of Scots was dragged there to witness the beheading of her alleged lover, "Bonnie Johnnie Gordow." At present it is used for a variety of purposes. This house is to be spared for some four or five years. In Burnett's Close, a house bearing the date 1669 is to be demolished; considering its age, it is in a remarkable state of preservation. It is known as Afflick's Tavern. Other buildings in the district of minor importance are coming down.

### Prevention of Fire.

THE testing station of the British Fire Prevention Committee is already showing considerable activity, the investigations generally taking place on Wednesdays. Among the tests in hand are several with floors and partitions of an ordinary description as allowed by the Building Act, including solid timber floors, and floors with various aggregates of concrete, all of which are of course not subject to any patents, or the interests of any special firm. Of methods of the latter class, i.e., patented floors, patented ceilings, etc., a considerable number are, however, also under investigation, and amongst those in hand at the moment may be mentioned a floor by the Columbian Fire-Proofing Co., two floors of the Expanded Metal Co., a ceiling of the Asbestos Co., and windows by the British Luxfer Prism Co. The tests, which are carried out on

scientific lines, but with the practical purpose in view, are conducted by representatives of the Executive, the Council, and the body of Members in rotation, and their reports are circulated approximately bi-weekly. The tests carried out last week saw Major-Gen. E. R. Festing, F.R.S., South Kensington, and Mr. Arthur Cates, F.R.I.B.A., Surveyor to the Crown, as representing the Council, and Messrs. Edwin O. Sachs (Chairman), F. Farrow, Max Clarke, Charles Goad, Ellis Marsland, and Mr. Edmund Woodthorpe, representing the Executive. A number of District Surveyors represented the general body of Members, whilst the following four gentlemen attended as special visitors:—Mr. J. McDermott (War Office); Mr. J. C. Murray (Admiralty); Mr. J. B. Westcott, Surveyor (H. M. Office of Works); and Mr. Capon (L.C.C.). The number of Members and visitors attending tests has, of course, to be strictly limited.

### Arts and Crafts.

THE date for the opening of this year's Arts and Crafts Exhibition has been fixed for Monday, October 9th, and it will close on Saturday, December 9th. The Exhibition is to be held in the New Gallery, 121, Regent Street, London, and will consist of contemporary original work in decorative design and handicraft, such as: Designs, cartoons and working drawings, decorative painting, textiles and needlework, glass (except stained glass, for which there is no suitable light), pottery, metal work, carving and modelling, plaster work, cabinet work, book decoration, printing and binding, wall-papers, and leather work. Anything calculated to encourage craftsmanship in these days of machinery and the division of labour is most worthy of encouragement, and the Arts and Crafts Society have done an immense amount of good by their efforts in this direction. Works intended for exhibition will be received at the New Gallery between 8 a.m. and 8 p.m. on September the 18th, 19th, and 20th. Further particulars can be obtained of the Hon. Secretary, Mr. T. J. Cobden-Sanderson, at the New Gallery, 121, Regent Street, W.

### Mr. G. F. Watts' Memorial Scheme.

AT the Consistory Court last Wednesday, before Dr. Tristram, Chancellor of the Diocese of London, an application was made by the vicar, the Rev. H. R. Gamble, and two churchwardens of St. Botolph Without, Aldersgate, for faculties (1) to erect a covered way or shelter in the churchyard, and (2) to remove from their positions over the holy table panels containing the Creed, the Lord's Prayer, and the ten commandments, and replace them by a centre fresco of "The Dead Christ Watched by Angels," with side frescoes of allegorical figures called "Watch" and "Pray," which Mr. Sigismund Goetze has painted and offered to present to the church. No opposition was offered to the first faculty to erect a covered wall or way in the churchyard at the expense of Mr. G. F. Watts, R.A., in which frescoes delineating heroism in the humbler walks of life may be inserted from time to time, after the manner of the panels of historical subjects in the ambulatory of the Royal Exchange. The churchyard is known as "the Postmen's park," and is about to be largely extended, provided sufficient funds are forthcoming. The present and only wall of the churchyard is formed by the houses in Little Britain, but when these are pulled down to widen that thoroughfare it is proposed to build a new wall with a covered way. The contention was that this covering or shelter would not contravene the Disused Burial Grounds Act, 1884, which made it unlawful to erect any buildings upon any disused burial ground except for the purpose of enlarging a church, chapel, meeting house, or other place of worship; this Act was passed to prevent non-consecrated burial grounds from being sold to speculative builders and built upon. There is no intention to erect a shelter on any portion of the land which was added to the park by the liberality of the public, at an expense of £6,000, and which is to be further extended when £12,000 has been raised, but it is to be confined strictly to the

disused burial ground, which forms but a very small portion of "the Postmen's park." The Chancellor reserved his judgment on this faculty.

### Art and Accuracy.

THE second application brought forth some amusing points. Of the three panels painted by Mr. Sigismund Goetze, the middle one was in the Royal Academy exhibition last year, and excited considerable admiration. The other panels were not then painted. It is proposed to place new panels, on which the Creed, Lord's Prayer, and the Ten Commandments would be painted, on either side of the apse facing the congregation, where they would be more visible than at present. Objections were raised against the central panel on the ground of its historical inaccuracy. It was pointed out that the Gospels described the body of Christ as being wrapped in linen and the angels as being clothed in white, whereas in the picture the body was nude and the angels wore coloured garments. The artist in reply to questions, said that he did not claim that his pictures were historically accurate—they represented truths, not facts. If they had been historically accurate, he should have painted our Lord as an Arab. In making the dead Christ a nude figure, he humbly followed the conception of illustrious artists throughout the ages. His reason for painting the two angels in purple dalmatics was that angels, being ministers of service, should be represented as wearing ecclesiastical garments of service. Mr. Goetze added, with an irritation which in the circumstances is not surprising, that he provided the pictures but not the brains for people to see them with. The consideration of the question was adjourned, the Chancellor expressing a desire to give the people of the parish an opportunity of expressing their views.

### Discoveries in Rome.

AS a further aid to the very successful excavations now being carried on in Rome, which have resulted in the finding of many important antiquities, Sir Philip Currie, the British Ambassador at Rome, has just handed to the proper authorities the sum of £2,400, very generously given by Mr. Lionel Phillips for the purchase of the so-called "Fiori" houses in the Forum Romanum. The only condition attached to the gift was that the houses should be pulled down and their site excavated within a reasonable time. The site in question was occupied by the Basilica Emilia, built by L. Æmilius Paulus in the year 54 B.C. The work is likely to yield results of the highest interest.

### An Architectural Umbrella.

THE extraordinary vagaries of Parisian engineers and builders are innumerable. Several years ago they set up the highest tower in the world, and when we tried to beat them we were speedily stuck in the mud. Now somebody has proposed another foolish fad for the delectation of people with more money than sense. It appears that, at the forthcoming Paris Exhibition, they are going to erect a mighty architectural umbrella—planned upon the Jack and the Beanstalk principle. In the centre will arise a huge umbrella "stalk" about 130ft. thick, and this great stalk will be divided into four stories. On each of these stories will be established concert bars and restaurants, so as to provide those who may feel disposed to ascend the umbrella stalk with something to alleviate their sufferings. But the special feature of the umbrella is yet to be mentioned. Spreading out in all directions from the summit, in the manner of an open umbrella, is to be a great glass roof, like the branches of the tree in Nebuchadnezzar's dream, capable of sheltering half the population of Paris. In sober truth this enormous roof is to be about 450ft. across, and will give accommodation to 30,000 people at once. It is to be hoped that the Germans, if they ever get as far as another siege of Paris, will spare this extraordinary erection; and that the monomaniac who proposes to erect it will not find any imitators on this side of the Channel.

## Professional Practice.

**Douglas, Isle of Man.**—The foundation stone of a new Primitive Methodist Church was laid last Thursday week. Mr. John Wills, of Derby and London, is the architect. The new buildings occupy a very fine and commanding site in Buck's Road. The style adopted is transitional between the Norman and early English. The walls will be built of native stone, with Monk's park stone freely used for ashlar. The plan of the building is a rectangle, 64ft. 6in. long by 43ft. 3in. inside, exclusive of a choir. The front is flanked on the right with a projecting stairway, which runs up and finishes with coping and carved finial, and a large buttress which runs up and finishes with a pinnacle and carved finial. The left of the front is flanked with a square tower, which terminates at a height of 78ft. There are octagonal buttresses at the corners, which terminate with pinnacles and carved finials, with battlements between. There are two massive doorways in front, richly moulded, with gablets over; and over these is a large circular front window, with cusped tracery. All the other windows of the church throughout are either circular or segment headed. There are galleries at two sides and one end, with stairs leading to the same in front, and one at the rear. There are also at the rear two vestries, with lavatories, &c., and over these an organ chamber and choir. The roof will be partially open, with arched timbering and pitch-pine ceiling. The glazing throughout will be in cathedral glass, with leaded squares, diamonds, margins, &c. The approach to the front is by a broad flight of steps, and advantage is taken of the slope of the road to put a large room under the front part of the church, which will also have a class-room and a cloak-room, &c., in connection with it. The whole of the internal fittings will be in pitch pine. The church will seat a mixed congregation of 900 persons, and the cost of the scheme, including land and architect's fees, will be about £6,200.

**Loughton.**—The business of the late Mr. E. Egan, A.R.I.B.A., Architect and Surveyor of Loughton, Essex, and 39, Lombard Street, London, will be carried on by Mr. Horace White (who was the deceased's chief assistant for several years) in partnership with the widow. The style of the firm will be "Egan and White."

**Middlesbrough.**—The Tees-side Laundry Company, Limited, has just been formed in Middlesbrough. About 2600 square yards of land have been purchased with a frontage of 230ft. to Parliament Road. Mr. Walter G. Roberts, architect, of 61, Albert Road, Middlesbrough, has been instructed to prepare plans for the whole of the works, comprising the various departments for the laundry work, dyeing and dry-cleaning, carpet beating, employees dining-room, offices, stabling, boiler and engine houses, 85ft. high chimney stack, &c. It is expected that an early start will be made with the works.

**Norwich.**—The memorial stone of the new Technical Institute now in course of erection was laid last Monday week. The design is by the City Engineer, Mr. A. E. Collins, assisted by his chief draughtsman, Mr. W. Douglas Wiles. The walls are almost wholly of local brick, with Cossey brick mouldings and dressings. The area of the site is about 18,000 superficial feet, while the river frontage extends 190ft. and the frontage to St. George's Bridge Street 120ft. The building consists of basement, ground floor, first floor, and second floor. The foundations necessitated excavations of considerable depth below the river level, so as to reach the gravel bed. The foundations of the river wall were put in under contract by Mr. T. H. Blyth, of Foulsham. The necessary depth of the foundation walls has made it possible to put in a basement of nearly 12ft. high, and this will accommodate the heating and ventilation appliances, the plumbing,

ironwork, lasting, and engineering classes, and a lavatory. On the ground floor are rooms for technical instruction in boot and shoe making and dressmaking, offices for the headmaster, the secretary, and the committee, the library, a bicycle store, a cloak room, lavatories for both sexes, and a strong room, which last-named will be in the tower, forming the north-west corner of the building. On the first floor are a chemical laboratory, a science lecture theatre, office for the science headmaster, lavatories, a lecture hall, and rooms for the teaching of wood carving, geometry, machine construction, science and art, and various other apartments. On the second floor will be lavatories, an office for the art headmaster, and the life, elementary, antique, and other apartments required by the art teachers. Access to the whole of the floors is by means of a principal staircase, 36ft. by 19ft., leading from basement to roof. The staircases will be constructed in concrete throughout. The main stairs will be supported at one end of each step by the outer wall; the other end will be supported on arcading carried from the basement to the level of the second floor. The floors will be constructed of steel main girders and subsidiary girders of Dorman and Long's make, the latter being encased in coke breeze and cement concrete. The main entrance is in St. George's Bridge Street, with a secondary entrance from Monastery Court. Most of the doors of the buildings will be fitted with panic fittings. The heating and ventilating apparatus is arranged on the Blackman Combined Plenum and Vacuum system, by which fresh air is forced into the buildings by fans and drawn out at the top by fans. The contractor is Mr. S. Warburton.

**Nottingham.**—The foundation-stones of the new Nottingham workhouse buildings at Bagthorpe were laid recently. The site comprises 67½ acres, and was purchased at a cost of £12,900. The total cost, including site and furnishing, is expected to reach £250,000. The main building, or workhouse, is to be arranged to accommodate 612 inmates. This part is represented in the lower range of buildings, the administrative block being arranged between, with kitchens, food, and general store-room, large dining hall, offices, committee rooms, and apartments for the master, matron, and servants. For infirmaries paupers an extensive range of premises is to be constructed at the higher portion of the site, where accommodation is to be apportioned for 560 patients. In this case also the administrative block forms a division for the buildings inhabited by male and female inmates respectively; kitchen and store accommodation upon a liberal scale are provided in addition to distinct quarters for dispensary operations, medical offices, committee rooms, and separate apartments arranged for the storekeepers and steward. The extreme top left hand corner of the site will be occupied by a small isolation hospital, the building including a children's infirmary for thirty patients, a nurses' home capable of accommodating forty-five, and a separate block of buildings for the reception of mothers with infants. In a central position, immediately between the workhouse and the infirmary, is to be placed the engine and boiler-house, and on either side are buildings representing the workhouse and infirmary laundries respectively. At the back are workshops, stables, the labour master's house, a mortuary, and the quarters for the remand boys, while the large block of buildings to the extreme right of the site affords accommodation for the reception of 215 imbeciles. Close to the entrance gates are established the porter's lodge, receiving wards for nine, and vagrant wards for sixty-eight, together with stone-breaking yards and sheds. Upon the knoll commanding the whole site is placed the chapel, and the total accommodation in the entire building represents provision for 1614, exclusive of members of the staff. Mr. Frederick Evans is the contractor, and Mr. H. W. Foxworthy the clerk of works. Mr. Arthur Marshall, of Nottingham, is the architect. The cost of the buildings alone will be about £165,000.

## Masters and Men.

**Dundee Joiners** have gained an advance of ½d. per hour, which makes their wages 9d.

**The Aberdeen Masons**, in the building department of the trade, have been granted an advance of ½d. per hour.

**The Perth Glaziers**, after being on strike for a week, have gained their demand for an increase of wages from 6½d. to 7d. per hour.

**The Edinburgh and Leith Joiners**, to the number of about 1,500, have come out on a general strike for an advance on ½d. per hour on their present wage, which is 9d.

**The Newark Journeymen Plumbers** have struck work in consequence of the masters having refused to agree to the adoption of the Society's rules. They were willing, at first, to grant an advance from 6½d. to 7½d. per hour.

**The Barnsley Joiners, Masons, and Bricklayers** have been granted an advance of ½d. per hour from May 1st, making the rates for joiners and masons 8½d. per hour, and for bricklayers 9d. per hour.

**The Scarborough Master Builders' Association** met the representatives of the Scarborough Labourers' Union on the 14th inst. with regard to the refusal of the Union to work with non-union men, but no agreement was come to.

**The Glasgow House Carpenters**, to the number of nearly 3,000, who came out on strike on Friday, for an advance of ½d. per hour on their present wage of 9½d., have had their demand granted by the masters. This is the highest wage ever paid in the district.

**Messrs. Doulton and Company's** pottery works in South Staffordshire are practically at a standstill, for about 1,000 men in the clay pits are standing idle, owing to twelve of the men being discharged for refusing to work until 9 o'clock at night, and twelve others dismissed for refusing to take their places.

**The Plasterers' Dispute.**—There seems a great likelihood of this dispute extending to a lock-out in the whole building trade. The Lancashire, Cheshire, and Yorkshire Master Builders' Associations have agreed that a general lock-out would be the best solution of the difficulty. At a private meeting of the Standing Committee of the National Association of Master Builders, held at Derby on the 19th inst., several important resolutions regarding a general lock-out were passed, and will be considered at the quarterly meeting of the Council of the Association, to be held at Birmingham to-morrow. It is stated on good authority that during the first three weeks of the lock-out the funds of the operative plasterers were reduced by about 25 per cent., the amount being about £5,400, and this, in spite of the fact that, in addition to the special levy, the members paid in during this period about £1,000 in ordinary contributions for sick benefit and superannuation purposes. It is now seven weeks since the lock-out commenced, and the total amount of funds the men had at the commencement of the struggle, it is stated, was under £19,000. The master plasterers in London have succeeded in filling up the places of the men locked out, and a large body of men are said to have seceded from their union, and to have found employment. The masters at Leeds have decided to prosecute the offenders in future in any cases of intimidation; an act of violence to a labourer in the town has led to this decision. At a meeting of the Yorkshire Federation of Building Trades last Friday, the question of the necessity for a foremen's union was brought forward, and the groundwork for such a union was prepared. A general agreement between architects and builders was submitted and approved, and steps will be taken to put it in force.

## Builders' Notes.

**The Builders' Clerks' Benevolent Institution.**—The twenty-first annual dinner of this institution was held last Tuesday week in the King's Hall of the Holborn Restaurant. The chair was occupied by the president, Mr. Alfred F. Randall, and there was a numerous gathering of the friends and supporters of the institution. The toast of "The Builders' Clerks' Benevolent Institution" was submitted by the chairman, who stated that it was thirty-three years old, having been inaugurated in 1866 by Mr. T. P. Ward. The object of the institution was the granting of pensions and temporary relief to builders' clerks and their widows, and the maintaining and educating of their orphans. In 1868 the amount paid in relief was only £12 15s., but in 1898 it was no less than £504. The total amount spent in relief since the foundation of the institution was £17,336. The very greatest care was exercised in the distribution of the pension, and great promptness was also displayed. The committee had power to expend in immediate temporary relief a sum not exceeding £10. They were able to grant a pension of £30 to the clerks, and one of £24 to the widows, while the children were looked after in the Orphan Working School. At the present time there were twenty-one pensioners on the books of the institution. Mr. R. C. Foster gave in warm terms the toast of the "The President." Other toasts followed, and a pleasant evening was spent. During the evening the secretary, Mr. John Austin, announced that the collection amounted to the sum of £200, including a donation of £25 by the chairman.

**Building Dispute at Lynn.**—A reference took place at the Duke's Head Hotel, Lynn, on April 12th, the plaintiff being Mr. H. G. Rudrum, builder, of King Street, Lynn, and the defendant, Mrs. Ada Jane Nicholls, wife of Mr. W. Nicholls, wine and spirit merchant, of South Wootton, who was sued in respect of her separate estate. Plaintiff's claim was for £260 1s. 2d., balance of work done and materials supplied under a building contract between plaintiff and defendant, and for extra work done and materials supplied. The official referee was Mr. Edward Pollock. Counsel for the plaintiff in opening the case for plaintiff, said the original amount of the contract for the building of a residence at South Wootton was £1,012. According to plaintiff, a sum of £30 12s. 4d. was to be deducted as the amount of credit given for omissions, but £184 12s. 7d. had to be added for extras, making a total of £1,166 0s. 2d. There had been £900 paid on account, which after a deduction of £6 by the architect, left the balance of £266 0s. 2d., in respect of which plaintiff sued. Defendant had put in a defence, in which she pleaded the terms of the agreement, alleging that the builder had to satisfy not only Mr. C. S. Beck, her architect, but also herself as owner. She also alleged that £122 4s. 4d. should be deducted for deficiencies and omissions. Then she did not admit that the extras were properly included, and she had paid into court £137 16s 10d. as sufficient to pay plaintiff's claim. In a counter-claim defendant claimed the £122 4s. 4d. as damages. Counsel disputed the right of defendant to claim that the buildings should be to her satisfaction as well as that of her architect. Mr. Beck was her representative, and issued the certificates for payment, and that ought to be sufficient. He asked the referee to first construe the contract. Counsel for the defendant said that in the terms of the memorandum of agreement and the specification the proprietor was distinctly recognised as a separate person from the contractor. The phrase that the work had to be done "to the satisfaction of the proprietor" could not be interpreted as meaningless. There was, he urged, a dual, though, of course, reasonable consent needed. He was in a position to show that the works were not to her satisfaction, and were such as she ought not to be satisfied with as a reasonable woman. If there were defects in the house—as there were—the proprietor was

entitled to call into question the specification. Counsel for plaintiff said that there were three persons to satisfy—Mr. Beck, Mrs. Nicholls, and Mr. Nicholls, the last-named of whom was an amateur architect. A private discussion took place between the counsel, as the result of which it was announced that a verdict for plaintiff for £200 had been agreed to. The referee gave judgment for £200 and costs.

## Under Discussion.

### ST. ALBANS AND ITS ABBEY.

The last of the winter series of papers in connection with the Bradford Historical Antiquarian Society was read by Mr. Herbert E. Wroot, on "St. Albans and its Abbey," last Friday week. Mr. J. A. Clapham presided. In the course of the paper a sketch was given of the history of the Roman city of Verulam, and of the mediæval town and abbey of St. Albans, and the account was illustrated with a large number of old and modern engravings, by which the extent of the recent restorations could be well traced. At the conclusion of the paper a vote of thanks was accorded to Mr. Wroot on the motion of Mr. E. J. Moore, seconded by the Rev. Bryan Dale. Prior to the reading of the paper, a meeting of the Council of the Society was held, at which it was resolved that a sum of £5 should be given to the Restoration Fund of the Bradford Parish Church. It was also resolved that the first of the summer excursions should be on May 27th, when Selby Abbey will be visited.

### ARCHITECTURAL PRACTICE IN SCOTLAND.

At a meeting of the Glasgow Architectural Association on April 11th, the president, Mr. Geo. S. Hill, A.R.I.B.A., in the chair, Mr. John Arthur, of Glasgow and Ayr, read a paper on "Feuing Plans and Their Preparation." The essayist, in introducing his subject, referred to the fact that in cities this class of work was generally placed in the hands of civil engineers and surveyors to carry out, a state of things for which he thought architects themselves were largely to blame, from their lack of interest and, in many cases, incompetency for the work. He submitted, however, that with regard to the plotting out of country estates for feuing purposes, the architect from his architectural training and experience, was the one best qualified to judge how to take full advantage of their natural beauty and surroundings, to give to their prospective road and houses their highest degree of picturesque aspect and utility; and he exhorted those present to take a greater interest in this work, and to follow more closely in the footsteps of their country brother architect in this respect. The author then referred to surveying and levelling as being two necessary qualifications of the estate architect, and proceeded to show in detail by illustrations and demonstration how to survey and level a piece of land, and the use of the various instruments required for that purpose. This led up more particularly to the subject under review; and the author went on to describe what steps were needed to be taken with regard to the preparation of feuing plans for large estates, using Government ordnance maps as a basis for that purpose, to show how and where to lay off new roads to best suit the arrangement and requirements of feus; how to take levels along the line of old and new roads; and how to reduce these levels to a common ordnance datum. The paper was fully illustrated by large scale drawings and examples of feuing plans. A vote of thanks to the author brought the meeting to a close.

**A Peal of Four Bells** has just been placed in the steeple of Arbroath Parish Church, and a new big bell, weighing with wheel, crank, and other connections over two tons, has also been placed in the bell chamber. The bells have been supplied by Messrs. J. C. Wilson and Co., Limited, of Glasgow.

## Engineering Notes.

**At Mile Road Infirmary, Liverpool,** electric lighting was installed recently.

**The New Workhouse Infirmary, Ford, Devonport,** is being warmed and ventilated by means of Shorland's patent Manchester stoves with descending smoke flues, patent Manchester grates, and Shorland's patent exhaust roof ventilators and inlet tubes, supplied by Messrs. E. H. Shorland and Brother, of Manchester.

**Electric Lighting in South Africa.**—At Pretoria the electric light is to be installed in the Government strong room.—The Durban Corporation are negotiating for a loan of £50,000 for electric lighting extensions.—The rate-payers of Cape Colony have sanctioned the adoption of a scheme for electric lighting by water power for Aliwal North.—A syndicate has applied for a concession for lighting Port Elizabeth by electricity. The authorities had already once called for tenders; they then threw them aside and decided to undertake the work themselves, and, subsequently, it would seem, dropped the idea altogether.

**Electric Tramways and Railways.**—At Dover the system of electric tramways has been very successful during the year. £9,000 has been taken in penny fares alone.—A committee has been formed at Chester to promote a scheme to construct a light electric railway at an estimated cost of £40,000.—The receipts from the electric trams at Blackburn the week before last were £450 in excess of those for the same week last year.—The Eastbourne Town Council have instructed the borough engineer to prepare plans for a system of electric tramways in the town, and have refused to entertain proposals from the British Electric Traction Company, Limited, to inaugurate an electric tramway system themselves.—The deputation of the Southampton Tramway Committee appointed to visit certain large towns, with a view to studying the systems of electric tramway traction in use, report that, after inspecting the various systems, they are unanimously of opinion that the overhead system adopted by the Southampton Corporation is the cheapest and best, and the electric system throughout the various towns has proved to be economical and advantageous.

**Electric Traction for N. W. London.**—Mr. Balfour Browne, for the North-West London Railway Company, explained to a Select Committee of the House of Commons, presided over by Mr. Jeffreys, a scheme for the construction of an underground electric traction railway, four miles in length, between the Marble Arch and Cricklewood, with stations at the Marble Arch, Edgware Road, Kilburn, Brondesbury, a point a little farther north, and Cricklewood. The capital power asked was £1,500,000, with borrowing powers of £500,000; and the line, which was to have double tunnels, was estimated to cost £1,065,183. The fares proposed were:—From Cricklewood to Marble Arch, before seven in the morning, allowing the return journey to be made at any time in the day, 2½d.; from Cricklewood to Kilburn, half the distance, 1½d., return; and from Marble Arch to Kilburn, the same. These fares were agreed to by every local authority except the County Council, which wanted the fare to be made 1d. for the single, and 1½d. for the double journey. Mr. Freeman now said that the County Council, which was the chief opponent of the scheme, had further considered the matter, and was prepared to accept 2d. instead of 2½d. as the return fare, and 1d. as the single, both applying to any distance. In the result the Committee passed the preamble, deciding unanimously to allow the return fare of 2½d., and the single fare of 1½d.

**A Soldiers' Institute at Preston** was opened recently.

FENCE POSTS, PALINGS, &c., &c.

For Quotations and Particulars, apply to the Sole Importers,

THE JARRAHDAL JARRAH FORESTS & RAILWAYS, Ltd. AGENCY OFFICES: 1, Fenchurch Avenue, London, E.C.

Do not miss **STAND 89** at the Builders' Exhibition, London, where the **VALVELESS SYPHON CO.**, of Kirkstall, Leeds, are showing their well-known "**WATERWITCH**," "**NEPTUNE**," & "**KIRKSTALL**" Syphon CISTERNS.

# CARBOLINEUM AVENARIUS

(REGISTERED).

## PATENT WOOD PRESERVATIVE.

**CARBOLINEUM AVENARIUS**, the well-known Wood Preservative, enters the wood by its own action, and does not require a costly plant and machinery like other Wood Preservatives.

**CARBOLINEUM AVENARIUS** entirely prevents dampness in brick and stone walls, also wet and dry rot in timber above or below ground, and is used by all the leading Railway Companies, and by Builders, Brewers, Contractors, Estate Agents, Mine Owners, &c., &c., in the United Kingdom.

**CARBOLINEUM AVENARIUS**, the most successful preservative and antiseptic for Wood Paving Blocks. Used in the Metropolis and many Provincial Towns. Superior to Creosote or Hard Wood.

For further Particulars and Testimonials, apply

**PETERS, BARTSCH & CO., DERBY**, and 68, Queen St., Cheapside, London.

## To All Owners and Users of Steam Boilers.

PATENT 22,561, ACCEPTED FEBRUARY 9TH, 1895.

### ABSOLUTE PREVENTION OF BOILER INCRUSTATION.

By addition of Chrome Salts to the Feed Water the formation or deposit of all Incrustation is thoroughly prevented.

For Cost of Licenses and Full Particulars, apply

**PETERS, BARTSCH & CO., DERBY**, and 68, Queen Street, London.

## INDESTRUCTIBLE COMBINATION WASHERS,

FOR FLANGE JOINTS OF STEAM AND WATER PIPES.

Tested up to 2300lb. Pressure

These Washers consist of Rings of Soft Metal, grooved outside, and holding in the groove packing material such as Asbestos, Rubber, Hemp, &c., &c. The soft metal, in conjunction with the packing included, will accommodate itself readily to any unevenness in unplaned flanges, and make a perfect and durable joint. It is impossible, owing to their construction, to blow them out under any pressure whatever.

**PETERS, BARTSCH & CO., DERBY.**

London Office: 68, QUEEN STREET, CHEAPSIDE, E.C.

2, Army and Navy Mansions, Victoria Street, London, S.W.

# THE BUILDING TRADES' EXHIBITION.

THE present Exhibition is beyond question the largest and most comprehensive that has yet been held, and it promises in every way to be most successful. The preparation of the various stands has involved a great deal of work, and for a week past there has been as much jerry-building in the Agricultural Hall as in a growing London suburb. But this is a case in which jerry-building is positively virtuous, and one cannot but admire the ingenuity with which some of the exhibitors have erected houses in miniature on which to display their special methods of construction.

Owing to the fact that we publish on the day on which the Exhibition opens, our information with regard to the exhibits had to be gleaned while the stands were in varying degrees of completeness. For that reason some of the notices are more meagre than we could wish; a brief notice of an exhibit, therefore, must not be regarded as an indication of our sense of its importance.

It is impossible to deal adequately with the Exhibition in a single number, and we shall publish a second Special Supplement with our next week's issue. Some of the stands are described below, but we defer until next week an account of many important and interesting exhibits, including the whole of those in the Smoke Prevention and Road-Making Sections.

## THE BUILDERS' JOURNAL.

Stand No. 62 in Row C is one upon which our readers, we are sure, will look with kindly eyes. It is tastefully and comfortably fitted up, and a number of works of art, including some of the original drawings that have been, or will be reproduced in the "Architectural Review" and the BUILDERS' JOURNAL, will afford a pleasing contrast to the useful but not very beautiful exhibits of some of the neighbouring stands. One of the attractions of our stand is a phonograph, which at intervals during the exhibition will discourse on matters of vital interest to all connected with the building trades. We hope many of our readers will spend a few agreeable minutes listening to its pertinent remarks. There is also a goodly show of the publications of the Talbot Newspaper Co.—the BUILDERS' JOURNAL, "Architectural Review," and "Specification"—both in single numbers and in bound volumes.

## MEJER, GREENWOOD, AND SON, LIMITED.

This firm is exhibiting on its stand a screen illustrating three different styles of decoration with "Vernolene" for frieze, wall filling, and dado. Another screen is shown representing the wall section of a drawing-room, which is painted with white "Vernolene," the raised parts being gilded. This demonstrates that "Vernolene" is adapted for painting raised wall decorations, and can be gilded. Two marine views and several panels painted with this article are shown. "Vernolene" is claimed by the manufacturers to be suitable for application on Portland cement, plaster, brick, stone, galvanised iron, woodwork, and many other grounds. The factory of Messrs. Mejer, Greenwood, and Son, Limited, is in Oxford Street, Hull.

## W. DUFFY.

Mr. W. Duffy, of Gainsborough Road, Victoria Park, London, is exhibiting his patent system of dowelled wood paving which, he asserts, costs less per annum than any other system. The blocks are bound together so that a homogeneous and practically immovable pavement is obtained, and tilting or dislocation is rendered almost impossible. The blocks can be laid without concrete. The method employed by Mr. Duffy in securing the blocks together, consists in the making of recesses or holes in the blocks, into which are inserted dowells or bonding keys of a special type. This system has been used in several buildings, and the manufacturer has laid about 1,000 square yards of the pavement for the Great Central Railway Company in front of their terminus in Marylebone.

## THOMAS FEWSTER AND SON, LIMITED.

This firm is exhibiting a novelty which takes the form of an illuminated showboard, and is placed at the back of the stand. It is wood stained with their preparation, and contains the words "Decorated with Fewster's Turpentine Stains," and has the appearance of inlaid wood. The firm claims that its stains are strong and permanent colours, which can be diluted with turpentine or varnish to give lighter shades, or mixed together to give intermediate tints. The

stain does not raise the wood like a water stain, and, as it dries quickly, may be varnished over in a few hours. The makers say that when a good coat of stain is applied, no sizing is required before the work is varnished. The stains can be used for church and chapel seats, decorating shop fronts, counters and fittings, house fronts, furniture, wood boxes, and a multitude of other purposes. Among their other exhibits are their oil paper varnish and their amber oak varnish. Specimens of the paints manufactured by the firm are exhibited conspicuously. Their address is Sykes Street, Hull.

## JOHN PARKER.

Architects and builders who have occasion to employ the 'dry closet' system may be recommended to examine the exhibits of Mr. John Parker, of Worcester Place, Oxford. The closets shown are in several forms, but are all constructed on the same sanitary principle. The great desideratum in earth closets is that the earth should be applied automatically and immediately upon each use of the closet. This is accomplished in the case of the closets shown by Mr. Parker, which are self-acting by means of levers under the seat; directly the seat is relieved from the pressure of the occupant, the deposit is covered with earth, and no offensive smell can possibly arise. Ashes may be used instead of earth; in either case the closets are perfectly cleanly, and the removal of the receptacle is not at all offensive.

## FOXCRIFT AND DUNCAN.

The exhibits of Messrs. Foxcroft and Duncan, electrical and mechanical engineers, of 24, Queen's Road, Dalston, include three "Sappho" inclosed arc lamps, one painted cover, and two polished copper covers, as approved and adopted by the London County Council, the Shoreditch Vestry, and other local bodies. The makers claim for the "Sappho" lamp that it is the best and cheapest inclosed arc lamp on the market. They also show examples of open type arc lamps. All these lamps are suitable for direct or alternating current, series or parallel working. Messrs. Foxcroft and Duncan are also makers of voltmeters, ammeters, galvanometers, cell testing sets, telephones, bells, and other electrical appliances, a fair selection of which is to be seen at their stand.

## JULIUS HULSEN AND CO.

This stand will be of special interest to brickmakers. Messrs. Julius Hulsen and Co., 28, Sandhill, Newcastle-on-Tyne, are the English agents of Messrs. Walter Feld and Co., manufacturers of precipitated carbonate of barytes, which is largely used both in this country and abroad in the manufacture of bricks, tiles, and terra-cotta, as a preventative against scum. To demonstrate the utility of their preparation, Messrs. Hulsen are showing burnt goods made from the same seams of clay, some of which have been burnt with and some without an admixture of barytes.

## THE THRELKELD GRANITE CO., LIMITED.

The most striking exhibits at the stand of the Threlkeld Granite Co., Limited, of Keswick, are a large and varied selection of the

Company's granite ornamental tiles. These tiles have been made and used with conspicuous success on the Continent and also in India, and the company anticipate that on the tiles becoming generally known in England they will be extensively adopted for the floors and dados of public buildings, hall floors, corridors, and floors of private houses. The special advantages claimed for these tiles are that they are frostproof, impervious to moisture, and remarkably durable. The colours are at least 1 in. thick, and the company undertake, if sufficient time is allowed, to manufacture their tiles in any colours required by the architects. Examples are shown of tiles with plain surfaces and also with the pattern shown in relief in imitation of mosaic. In addition to their encaustic tiles the company are exhibiting specimens of their syenitic granite macadam and granite-concrete paving which are extensively used in Lancashire, Yorkshire, Cumberland and Westmorland. Their output of macadam, we understand, amounts to about 500 tons per day, and of granite-concrete paving to about 3000 super. yards per week.

## "VELURE."

This is the name of a paint which possesses some noteworthy qualities. It gives a most brilliant enamel-like surface, though it is not an enamel but a varnish paint without any gum. Being elastic, it allows for the contraction and expansion of a metal surface without cracking or chipping. It is made in a great variety of tints; the white is especially useful, as it is guaranteed to keep its colour and not turn creamy. "Velure" can be applied to paper, wood, or metal, and it is said to possess great durability and capacity for being cleansed. This speciality is exhibited by The "Velure" Agency, 19, Southampton Row, London, W.C., who are also showing samples of varnishes, gold size, and oil.

## THE FIREPROOF CONSTRUCTION COMPANY, LIMITED.

In the erection of the fire and sound proof partition, which is the speciality of this firm, wood and iron supports do not find a place. A partition only 3 in. thick is claimed by them to be absolutely fireproof and sound resisting. Examples of the work are being shown; and at the company's offices at 132, Wool Exchange, London, E.C., fixed work can be inspected.

## H. HERMAN, LIMITED.

This firm is exhibiting three very artistically carved easels; one is Gothic style in carved oak, another is Renaissance in walnut, and the last is Louis XV. style in dark mahogany. The details are very carefully carved in the respective styles, and illustrate the excellence of the work Messrs. Herman, Ltd., execute. The firm has branches in Glasgow and Manchester; their London address is 67 and 69, City Road, E.C.

## W. GOODING.

At this stand are exhibited a variety of stair treads, which the manufacturer claims to be "the only perfect." The treads consist of an iron keeper, pierced with a number of square-shaped holes, into which are inserted blocks of rubber. Mr. Gooding, whose address is North Road, Holloway, London, N., is also exhibiting

his patent combined safety valve and fusible plug. This valve consists of a spiral spring which is adjustable to the pressure at which the valve is intended to rise, and in its centre is the fusible plug, so that in the event of the spring becoming fixed, or any similar mischance occurring at a time when an abnormally high steam pressure within the boiler is requiring an outlet, the plug melts from the super-abundant heat, and the danger is immediately obviated by the vent thus formed.

#### THE VALVELESS SYPHON CO.

The Valveless Syphon Co., of Kirkstall, Leeds, on Stand No. 89, show samples of their well-known "Waterwitch" and "Neptune" syphon cisterns and fittings, the sales of which have amounted to upwards of 40,000 in five years. Six closets are shown in operation. The first is the "Waterwitch" cistern in combination with the "Premier" washdown closet. The cistern case is a polished mahogany cabinet with carved front, held in position by substantial brackets of good design; the fall-pipe is of polished brass with screw coupling arrangement. The closet has seat extension, to which is attached a suitable mahogany seat with raised backboard, and it is especially suited for a private bathroom. The general action is most satisfactory, and an excellent flush is obtained with a quiet operation. No. 2 shows the application of the "Neptune" self-contained syphon to a porcelain or earthenware cistern, which can be supplied to match the closet. No. 3 shows the "Direct Neptune" closet, the latest improved and patented arrangement. In this case the syphon is another arrangement of the self-contained "Neptune" fitting, but is so constructed as to dispense with bending the flush-pipe, thus effecting a more direct flush, while maintaining a neat and finished appearance. The cistern is of sheet copper, the fall-pipe is of polished brass, the seat of polished mahogany, while the closet basin gives a good result and has County Council outlet. No. 4 is the "Direct Waterwitch" closet, arranged in all particulars like the above, with the following exceptions: that the syphon is the "Waterwitch," and the closet the "Axis," with screw trap outlet, and arranged to meet the London County Council requirements. No. 5, the "Direct Kirkstall" cistern (which will undoubtedly rival the famous "Waterwitch" cistern made by this firm) shows the application of the patent syphonic valve, which is brought into operation by the least movement of the pull, viz., half-an-inch; this renders it particularly suitable for use in hospitals, asylums, workhouses, schools, &c. The pull is so slight that the smallest child can with perfect ease put the closet into full operation. No. 6, the "Neptune" Low-down Closet, is an application of the patent self-contained Neptune 1½ in. syphon, with a very limited fall of 15 in. only to flush the closet effectively. It is especially suitable for contracted situations.

#### THE NATIONAL GAS ENGINE CO., LIMITED.

In Bay No. 12 may be seen in full working order the "National" gas engine, made by the National Gas Engine Co., Ltd., of 117, Queen Victoria Street, London, E.C. They are also exhibiting other types of ordinary engines, in connection with which a patent oiling arrangement for the connecting rod is displayed. Their "O" and "T" types of ordinary engines are being used with a patent starter.

#### A. C. W. HOBMAN AND CO.

That the paving of floors with mosaics is a durable and artistic way of decoration, there is no doubt, and a look over Messrs. Hobman and Co.'s stand will at once convince the visitor that they are masters of the craft of mosaic paving. They are exhibiting various examples of mosaic granolithic paving, and also a staircase with mosaic steps, specimens of window cills, moulded cornices, Kentish ragstone for paving, &c., and these all go to make their stand a most interesting one. The address of the firm is, Cliftonville, South Bermondsey, London, S.E.

#### THE FARNLEY IRON CO., LTD.

Messrs. Farnley, of Leeds, are exhibiting a variety of glazed bricks. These are in so many patterns that we will not attempt the task of enumerating them. Porcelain baths of good quality, glazed in white on the inside alone, form part of their exhibit; sink and lavatory pedestals in either glazed white or buff are a special feature and at once command attention. The urinal which this firm makes is intended to be erected against a glazed brick wall, and consists of a half-round back, top cover, continuous channel, front pillars, and sole plate. The half-round back is sloped forward, and brought straight at the bottom, so as to deliver into the continuous channel. For flushing, either a rose or a spargepipe may be used. The many

examples of gully traps are of excellent manufacture, and the patterns exhibited of different pipes and channel bends are typical of what is supplied by the firm.

#### JOHN P. WHITE.

Mr. John P. White, the Pyghtle Works, Bedford, manufactures every description of high-class joinery, but makes a speciality of wood chimney-pieces. Of these some very artistic designs are being exhibited, one of which is here reproduced. The designers of the chimney-pieces shown at Mr. White's stand are:—C. E. Mallows, C. H. B. Quennell, H. Wilson, G. L. Morris, George Jack, A. A. Gibson, J. S. Cooper, A. Cox, E. T. Hall, and F. W. Hamilton.

A FIREPLACE DESIGNED BY C. H. B. QUENNEL, AND MANUFACTURED BY J. P. WHITE, OF BEDFORD.

**F. W. POTTER AND CO.**

This firm is showing a variety of electric wing fans, which it is claimed do not obstruct the light, and have adjustable blades and bearings. Their "Dovetail" copper gauze brush is also being exhibited. It is made of copper wire gauze, so folded that the part intended to face the commutator consists of plain layers of gauze to the extent of about one-half the thickness of the brush, backed by about an equal quantity of gauze which is folded or corrugated at right angles to the plain layers; the degree of stiffness can be varied. The "Steelead" stair tread seems to be a very durable article, and is claimed to be non-slipping. The address of the firm is Phipp Street, Great Eastern Street, London, E.C.

**THE UNITED ASBESTOS COMPANY, LIMITED.**

This stand is devoted to selections of the "Salamander" decorations for walls, ceilings, friezes, and dados. These decorations are in

GOthic DESIGN, IN "SALAMANDER" DECORATION, EXHIBITED BY THE UNITED ASBESTOS CO. LIMITED.

relief, and some of the designs are very good. The Gothic design in 1½ in. relief, of which we give an illustration, is a good example of what can be done by the firm. Several ceiling panels hung outside the stand are well calculated to meet the popular taste. "Salamander" is made from asbestos, and is, therefore, fireproof. The firm's address is 158 and 160, Charing Cross Road, London, W.C.

**H. PAHL AND CO.**

The houses made from the glass bricks manufactured by the above firm are not those referred to in the saying that "People who live in glass houses should not throw stones." The "Falconnier" glass bricks would stand any amount of stones thrown at them. They are hollow, hermetically sealed, and contain air. The laying of them is accomplished in the same manner as ordinary bricks. Messrs. Pahl and Co., of 14, Farringdon Street, London, E.C., are exhibiting a miniature kiosk built with these bricks, and it has a very attractive appearance.

**JAMES SMITH.**

This stand is devoted to a new iron joint for stoneware pipes, called "Ernest Smith's," which differs from the ordinary stoneware pipe, as it is without the usual stoneware collar, and in its place is a very light iron collar or socket, which is fitted on to the body of the pipe with a cement composed of sulphur and precipitated gypsum. The joint, as will be seen from the illustration, is practically the same joint that is used in cast-iron water mains, and is very easy to make. The annular space between the spigot and the collar is fitted with a strip of blue lead, cut for the purpose and of the proper thickness. The

spigot is pushed home, and a very small amount of caulking makes the joint perfectly watertight. As to cost, the manufacturer says that it is less than half that of iron pipes. The address of the maker is 82, Coldharbour Lane, London, S.E.

**LAURANCE SEAGER, AND BOWER AND CO.**

Mr. Seager is exhibiting an improved step-ladder which can be used as a tressle and as an ordinary straight ladder. Messrs. Bower and Co.'s off-bearing barrow is an improvement on the old-fashioned sliding top, as it runs much lighter, and is less liable to shake the bricks. The patent wooden moulds on show are strong and light. A large assortment of barrows, sieves, and screens is being shown. The address of the makers is Sittingbourne, Kent.

**WILSON AND CO.**

The special feature shown by Messrs. Wilson and Co., of 24, Harrison Street, W.C.,

is hygienic register stoves for warming and ventilating rooms. These stoves are intended to meet the general need for economy and efficiency in the warming and ventilating of rooms without seriously interfering with the usual style of open fire-grates, or the architectural arrangements. A perfect ventilator is the great desideratum of the day; and in this stove the makers claim to have solved the problem. The arrangement consists of an air chamber under the hearth, which is supplied with fresh air by means of a pipe. The cold air becomes warmed in this chamber, and also in the pipes leading from it to the face of the register stove, whence it is admitted into the room through a ventilator pure and warmed. The increase in the temperature of the air admitted is from 10deg. to 20deg. The rate of ingress depends upon the difference between the outside temperature and the inside, but about 50 to 60 cubic feet per minute of pure warm fresh air is the usual rate at which it can be admitted. Messrs. Wilson and Co. must be complimented on the artistic appearance of their stoves.

**THE MOREAU MARBLE CO., LIMITED.**

The visitor, on arriving at this stand, will find a variety of decorations in marble, such as staircases, chimney pieces, columns, altar screens, fonts, pedestals, tables, vases, &c. The speciality of this firm is Moreau marble, which is white limestone, coloured, hardened, and converted into marble by a scientific process which imitates the action of nature. The firm undertakes to produce any shade of the richest marble, either with natural veining, self tints, or with solid inlays of any pattern or colour. Judging from the specimens ex-

hibited, the company have been surprisingly successful in their imitation of the natural product. The works are at 79, Lots Road, Chelsea, London, S.W.

**JULIUS SAX AND COMPANY, LIMITED.**

The principal feature of this exhibit is the "Eagle" patent arc lamp. The makers claim that it is almost a matter of impossibility for their lamp to get out of order. The accompanying diagram illustrates the manner in which the lamp works. A is the bobbin, B is the armature, C and C' are flexible metallic cords, D and D' are the carbons, and E is a counter-weight. The carbons, when the lamp is currentless, are held together. When switched on the bobbin attracts the armature, and this in turn separates the carbons, so that the arc is established. The length of the separation is rigidly and accurately maintained by the magnetic balance. The armature cores being laminated, the lamp works equally well for direct or alternate current. From the centre arches of the stand four of these lamps hang, and on a table there is an arrangement by which the action of the carbons in direct and alternate currents is thrown on to a screen in a magnified form. On each side of the stand are two panels: No. 1 contains electric bells and indicators to be used in hotels, private houses, &c.; No. 2 is covered with fire alarms and burglar alarms of various descriptions; No. 3 is devoted to all kinds of electric fittings; and No. 4 displays specimens of the firm's water gauges and tank alarms. The firm is exhibiting the original telephone stations that were used by the Queen between Southampton and Osborne, and the history of the electric bell system is being well illustrated

DIAGRAM ILLUSTRATING "EAGLE" PATENT ARC LAMP. EXHIBITED BY JULIUS SAX AND CO. LIMITED.

by models. A brass electrolier hanging from the roof of the stand is a good illustration of the work this firm turns out. Many other things in the shape of switches, electric communicators, pushes, &c., are being exhibited, among which may be mentioned the electric tell-tale clock, or recorder for watchmen. This apparatus is designed to check and keep a permanent register of the time at which watchmen visit the various points on their round. It is in a lock-up case, and cannot be tampered with. The firm's address is Eagle Works, 119, Coldharbour Lane, Camberwell, London, S.E.

**AMES CROSTA SANITARY ENGINEERING CO., LIMITED.**

This stand is essentially a sanitary one, and Crosta's patent surface water gully is very much in evidence. The chief advantages claimed for this gully are, that it has a double trap which seals noxious sewer gases; that it thoroughly intercepts all road detritus without getting out of order; that it has a small area of water exposed to the atmosphere, is made of impermeable metal, and withstands heavy traffic; that its fixing costs less than

CROSTA'S PATENT SURFACE-WATER GULLY: LONGITUDINAL SECTION. EXHIBITED BY THE AMES CROSTA ENGINEERING CO. LIMITED.

other makes; and that it is made in a variety of sizes to meet all conditions. The Ames and Crosta's patent self-adjusting pipe joint is another feature of their exhibit, and is an effective and economical article. The man-hole cover which this firm, whose place is at Nottingham, are showing seems to be a good arrangement.

**THE RUSTLESS IRON CO.**

This firm has a stand devoted to the rustless articles they manufacture, prominent among which may be seen the "Trico" rustless furnace pans. These are supplied in all sizes, from a capacity of 6 gallons to 200 gallons, and with a spout attached from 8 gallons to 50 gallons. If you want a larger size, give your order at the stand, and it will soon be executed. "Trico" rustless three-legged pots can also be seen, and these are supplied in sizes from 8 gallons to 50 gallons. The Rustless Iron Co., of Keighley, make rustless boilers of all descriptions, as well as rustless saucepans, kettles, cisterns, tanks, troughs, gutters, drain and fall pipes, gratings, hollow ware, "and almost anything else you may require in a rustless condition."

**JOSEPH CLIFF AND SONS.**

All sorts and conditions of bricks will be found at the stand of Messrs. J. Cliff and Sons, of Brick Wharf, Waterloo Bridge, London, S.E. There are glazed, salt glazed, white, majolica, terra-cotta, buff, dove-tailed, and many other kinds of bricks too numerous to mention. Suffice it to say that they are of fine quality all through. Worthy of the special attention of the visitor are the faience mouldings and panels, of which the specimens shown are excellent examples of the firm's work. A patent continuous scum trough for swimming baths is a good invention, and evidently serves its purpose well. Chimney pots, porcelain baths, closets, gully traps, retorts, furnace, patent tiles, and sinks of various descriptions go to make a very complete exhibit.

**OATES AND GREEN, LIMITED.**

Messrs. Oates and Green, of Halifax, are showing an assortment of lavatory basins suitable for schools, public buildings, &c. These are in white glaze and the firm's well-known salt glazed ware. A feature of the

stand is a patent taper urinal, but the principal speciality of this firm is the waste water closet, and this is prominently exhibited. A very great variety of sinks, pipes, and interceptors are being shown. The specimens of gully traps and closet pans which find a place in the stand are deserving of particular notice.

**THE BATH CABINET MAKERS' COMPANY, LIMITED.**

This firm makes a good display of room decorations in the shape of wood chimney-pieces and overmantels. Their mahogany inlaid chimney-piece is an especially beautiful article, as is also the fireplace and overmantel of the same style. Inlaid and carved fumigated oak fireplaces and overmantels are a speciality of this firm, whose address is 54, Berners Street, London, W., and the manner in which the carving is executed is excellent. Numerous examples of carved and inlaid work of all descriptions are being shown, and repousse metal panels, grills, hinge plates, etc., all find a place in this interesting exhibit.

**C. A. ZADIG AND CO.**

Messrs. C. A. Zadig and Co., of 11, Queen Victoria Street, London, E.C., are exhibiting a set of points and crossings, which are constructed in such a way that the tongues can be moved with the foot in any direction desired. A double-side steel tip waggon which is on view seems to be a very useful affair. Its wheels and axles are made of the best steel, and it has dust-proof "Panama" axle boxes. The underframe is also made of steel, and has a lever to incline or level the truck. The makers claim that the cradle-tipping arrangement is so made that there is no possibility of the waggon upsetting, and the truck can be emptied with extraordinary ease. Another article worthy of notice is their iron turntable.

**G. AND F. COUZENS.**

Ball valve specialties are the articles which will be found on the stand of this firm, whose works are in the Tudor Road, Cardiff. The gully trap in illustration No. 1 has one of their automatic ball valves. It will be observed that a back pressure of water instantly raises the copper ball against the rubber seating in the top casing, thus forming an effectual seal; but should the tap become dry from any cause, the copper ball rests on the lower rubber seating, and prevents any escape of sewer gas. In another gully trap on view at their stand a similar purpose is served by means of an iron door faced with rubber. Illustration No. 2 shows

GULLY TRAP WITH AUTOMATIC BALL TRAP.

PATENT BALL TRAP INTERCEPTOR.

EXHIBITED BY J. AND F. COUZENS.

how their patent ball trap interceptor effectually prevents the back flow of water in basements during heavy storms. It will be seen that any back pressure of the water instantly affects the ball and forces it against the rubber seating. The makers state that architects can with confidence specify this trap.

**DOULTON AND COMPANY, LIMITED.**

A portion of this stand is allotted to the display of a selection of mantelpieces and fireplaces in glazed faience. We notice in the designs a successful attempt to depart from the more or less stereotyped fashions that have hitherto ruled in this department of ceramics. The forms are simple, and the colour effects quiet and restful. The

advantages of glazed fireclay as a material for fireplaces are so obvious that we need not enlarge upon them; the ware is always clean and bright, and the radiation of heat so gradual that an equal and healthy temperature is easily maintained. A few words must be devoted to the specimens of wall tiling. The same desire for simplicity of arrangement and artistic balance of colour is evident here. The stoneware tiling is of extreme importance, as it offers a material that can be used with confidence for artistic work, or any position where the ordinary glazed faience may seem to be inadmissible. The absence of a high gloss is the distinguishing characteristic of the "Carrara" stoneware, and this will recommend the material to those who dislike the effect of a too glittering surface. Both salt-glazed stoneware and the "Carrara" enamelled stoneware are in use for constructional work, and several important buildings have been recently erected in which they have been introduced. In the section of the exhibit specially reserved for sanitary fittings, we notice among other things some strong glazed ware sinks for hospital use. These are arranged so that the bed pans can be thoroughly cleaned without being handled in any way. This is done by means of a spray and jet, and the valves for these are worked by a treadle. The sink has a flushing rim, so that the whole surface can be cleaned after using. There are other patterns of sinks, chiefly made in glazed ware, but suitable for ordinary private use. The baths are very varied in pattern and design; Canopy, French and Sitz forms being among those exhibited. A noticeable feature is the patent vitreous enamel, with which the baths are lined. This enamel is very superior to the old metallic enamel and has a surface as clean and lasting as the earthenware baths, and is more varied in colour. There is one bath that calls for special attention, which is on the same principal as the Canopy arrangement, having a shower, spray, &c., but instead of the large hood at the back it is merely a skeleton arrangement with a hanging curtain. Amongst the lavatories there are some very highly finished examples with marble tops, friezes, &c., and special shaped basins. In all cases where fitted with standing waste, or vulcanite plug, the outlet is made as large as possible so as to allow their emptying quickly. For supporting these tops either ornamental brackets or highly finished standards are used, so that the whole space beneath is quite open. There is also a selection of decorated earthenware lavatories. Well worthy of special attention are some designs for valves, wastes, &c., for independent baths. The closets are

shown fitted for use. One which is specially good is the syphonic, which gives a good water area and depth of seal, and possesses advantages in its simplicity and strength of action. Amongst others, there are thick glazed closets for asylum use, and also one of the decorated "Simplicitas" type. The "Paisley" cistern is fixed with these closets, but it will be seen that in some cases the shell, instead of being made in cast-iron as is usual, is made in highly decorated pottery. This firm's exhibit also includes stoneware pipes, of the ordinary type and "self adjusting" and "composite" joints, both of which forms have been extensively used for main sewerage schemes, and for the drainage of hospitals, public buildings, &c. Amongst the selection of traps, gullies, and other stoneware appliances for sewerage and

drainage, some new designs of gullies are shown which are provided with an inspection and cleaning arm, fitted with metal, airtight cover. The display of white, enamelled fire-clay includes lavatories, sinks, &c., which are samples of excellent manufacture and careful design, embodying all modern sanitary requirements. Staffordshire earthenware, white and cane glazed, is represented by a selection of closets, urinals, &c.; while the Staffordshire blue bricks also visible on the stand afford further evidence of the wide range of the company's productions in all classes of ceramics. The address of the firm is Lambeth, London, S.E.

#### CHARTERIS AND LONGLEY.

Wood block flooring is exhibited by Messrs. Charteris and Longley, of Latona Road, Peckham, who show numerous samples of their patent "Perfected" system. An examination of the samples shows very clearly the simplicity and ingenuity of this system. The patent "Perfected" block is grooved along the bottom of each side, and has at each end a rabbeted tongue which fits accurately into the groove of the block lying next to it. By this means every block is securely keyed to its neighbour in a simple and effective manner. Many different patterns are shown proving that whether the design chosen be simple or elaborate the same perfect bond is obtained. The blocks are laid on a special damp-proof mastic which experience has proved to be the best obtainable and one that holds the blocks securely to the substructure even at very high temperatures. It does not become brittle, and has a natural affinity for all kinds of woods as well as for cement. Care is exercised in the selection of the wood used in preparing the "Perfected" blocks. The method of seasoning adopted is the well-known Shapland's process. It is found that wood treated by this process has a much firmer and brighter condition than if dessicated in the ordinary way, and that it sustains no injury to its fibre. To mention seriatim the advantages claimed by the firm for floors laid on this system we may say that they are absolutely rigid, adaptable in blocks of any size and in any kind of wood, can be laid in a great variety of patterns, suited to large areas, as basements, school corridors, &c., afford a smooth surface for dancing, &c., are sanitary, noiseless, damp proof, rot proof, and fire resisting, and make special provision for gaining access to hot-water pipes, &c. This last is a special feature which merits some description. Both sides of the trench to be covered with flooring are fitted with strong wood curbs, on which the blocks rest. These blocks are then securely fastened by long border blocks, which are screwed into the curb on each side. To obtain access to the trench it is only necessary to unscrew the border blocks along one side, and remove the tongued blocks.

#### KIRCHNER AND CO.

Messrs. Kirchner and Co., the well-known saw mill and wood-working engineers, whose chief office is at 118, Queen Victoria Street, London, E.C., are showing a good display of machines for builder's work, which alone make it worth while for everyone to visit their show who is in any way interested in the working of wood. During the last twelve months Messrs. Kirchner and Co. have considerably extended their works, and the number of workmen employed in this department alone is now about 1000, or 200 more than a year ago. In spite of this increase we are told that night work has had to be adopted to cope with the numerous orders in hand. The machines are all of good design. The material, finish, and workmanship are also excellent. Amongst the machines that this firm are exhibiting we noticed the following: Kirchner's new hand planer, with tables 8ft. long, to work stuff 12in. wide; a number of patent attachments can be used with this machine, of which Kirchner and Co. are the inventors, for spiral or square turning, for raising panels, &c. A show case placed in front of the machine contains samples of work done on the machine, giving a very fair idea of what it can do.

A 24in. panel planer, and a 16in. by 4in. three-cutter. The type of both of these machines is excellent. A 36in. band saw, to cut 16in., fitted with patent safety guards. An under-driven patent mortiser, which Kirchner and Co. say is of the most liked and approved pattern. A tenoning machine, to cut tenons 6in. long, and suitable for trenching shelving 22in. wide, of the latest type. Kirchner's patent variety moulder; this is a combined moulding and recessing machine, and works with a number of patent attachments. An automatic knife grinder for planing irons.

#### JOSEPH BROOKE AND SONS.

This firm is exhibiting samples of work made from the "Silex" hard York stone. Landings tooled, knotted, and self-faced, flags specially tooled, knotted, and self-faced, kerbs, coping, flags, wallstones, or parpoints, and channelling, all specially worked, go to show that the work turned out is of no mean order. The "Silex" stone is very durable. Its tensile strength is 1100 tons per cubic foot, absorption 1.02 per cent., and it is only procured from special beds in the lowest formations. The above firm have a nice exhibit of glazed bricks, majolica glazed fireplaces, baths, sinks, mangers, the patent "Duplex" pipes, "Grip" wall tiles, &c., all of which are of good quality and appearance. The ivory white glazed brick is a speciality of this firm, being very hard, and absolutely non-absorbent, and being dipped in a specially prepared vitreous body is quite impervious to damp or climatic changes. The fireplaces shown are specially adapted for use in hotels, schools, railway stations, &c. The chief offices of Messrs. J. Brooke and Sons are at Hipperholme, near Halifax.

#### MOORE'S PATENTS COMPANY LIMITED.

The feature of this stand is the patent windows manufactured by the firm, whose offices are at 73, Digbeth, Birmingham. The frame is of solid material and the sashes are made in the usual way, and are so slung that they always bear on the inner beading, and cannot rattle. The sashes can easily be regulated by means of sliding handles. Another advantage this window has is that a self fastener operates when the sashes are closed, making it impossible to open them from without, while it pulls the meeting rails tight together, and ensures their being locked. These sashes can also be regulated when high up by bringing the end of the cord down, or at a distance, by carrying it to any part of the building. By simply lowering both sashes to the bottom, turning in the hinged beading, and withdrawing the parting bead, the sashes can be turned inward on their hinges like a door. The windows are warranted watertight. The patent fanlight which this firm manufactures is a simple affair, as the cord operates it without cog or screw gear. The patent door spring is an article worth consideration; it does not require oiling.

#### DIESPEKER AND CO.

Messrs. Diespeker and Co., of 57 to 60, Holborn Viaduct, have a large stand, outside of which and inside of which (for they have arranged the inside as a very comfortable room) they show a large variety of samples and of drawings. All styles and kinds of mosaic seem to be represented, many of which are very beautiful in design and workmanship. Specimens of mosaic such as have been executed by Messrs. Diespeker and Co. at some of the most important buildings erected during the last twenty years are on view, amongst which we have especially noted samples of circular skirting and Venetian marble mosaic which they have laid in the various fever hospitals of the Metropolitan Asylums Board, for which body they have laid about 1,500 yards during the last few years; also a sample of similar work, though different in colour, being in this latter case all white, of which they have laid about 10,000 yards at the New General Hospital, Birmingham; sample of Venetian mosaic of which they have laid 3,000 yards at the General Post Office, St.

Martins-le-Grand, for H.M. Office of Works, which is very effective and rich in colour. At the New Birkbeck Bank they have laid 3,500 yards recently, and the Coat of Arms of the Birkbeck Bank, which they show, is made striking by its simplicity of treatment. A very effective design is shown of the floor in Roman marble mosaic as executed at the National Portrait Gallery for the late Mr. Ewan Christian. Samples of mosaic as done for H.M. War Office at different buildings are on view. We were struck by the very effective design for the entrance of the new Blackpool Alhambra which Messrs. Diespeker and Co. have been carrying out for Messrs. Wyllson and Long. Samples of floors as laid at Guy's Hospital, at the Queen's Hall, at the Hotel Cecil, at the Restaurant Frascati, at the Indian Institute, Oxford, at the Royal College of Music, and many other buildings are also on show. Messrs. Diespeker and Co. inform us that they could refer to quite 10,000 buildings in which they had laid mosaic, and in their list of reference, as well as in the paper read by the managing partner of the firm before the Society of Architects in May last, they claim that their mosaic is to be specially recommended on sanitary grounds, being non-absorbent, impervious to damp, and very easily kept clean. The specimens we have seen seem to bear this out. They also say that their mosaic is unequalled for durability as they only use the hardest marbles of each kind, so that they are enabled to guarantee, and they do guarantee it, for thirty years. This at first strikes one as an extraordinary guarantee, but as they referred us to some buildings in which their mosaic had been laid twenty years ago, and amongst these drew our attention to the mosaic at Olympia, which is still in perfect condition, though more than fifty million people have passed over it, Messrs. Diespeker and Co. seem quite justified in the claim they make for durability, and the risk they incur in guaranteeing their mosaic for so long a period is really a slight one. Their treatment of swimming-baths seems to us admirable. This treatment has been adopted for a good many baths recently, notably by the Corporations of Hull, Sheffield, Leeds, Ipswich, Tunbridge Wells, &c. All the samples and drawings on view here can after the Exhibition be seen at their show rooms, 57 to 60, Holborn Viaduct. Messrs. Diespeker and Co. are in all cases prepared to submit designs and estimates free, and they can execute all orders with great promptitude, as all their work is done in this country.

#### G. B. KENT AND SONS.

This firm is exhibiting a very large assortment of all descriptions of paint brushes. A specimen of every brush they stock is being shown on the stand, and all of them are of one quality—"the best." This is how the firm itself describes them, and the wide reputation they have acquired would indicate that the description is justified. Dusters of every kind are on view, and these appear to have been manufactured with great care. In fact, this remark can be applied to every article manufactured by the firm. The badger softeners are good articles, Messrs. Kent and Sons import their badger skins direct, dress them at their works, using the longest lengths for softeners, the middle lengths for shaving brushes, and the shortest for tooth brushes. The best quality is produced from the back; the hair is strong, and the tips are white. The hair cut from the flanks has darker tips. Their overgrainers are stocked in a large variety of sizes, and are made from the best hog and sable hair. They also supply a patent Swedish soldering lamp, which is strongly made in polished brass. The flame can be easily regulated to any size by simply turning a screw. Their blow and paint removing lamps are substantially made, and can be recommended. Coming back to brushes again, we may mention the sash tools, which are a speciality of the firm, and are of good workmanship. Every description of painter's brush is stocked by this firm, whose address is 75, Farringdon Road, London, E.C.

Property and Land Sales.

Between BLACKHEATH and CHARLTON.  
Important FREEHOLD BUILDING ESTATE.  
To Land Companies, Capitalists, and Building Speculators.—The choice Freehold Building Estate, known as Eastcombe, a portion of the estates of the late William Angerstein, Esq., on the main road from Blackheath to Charlton, about half a mile from Westcombe Park and Charlton Station, from whence London is reached by South-Eastern Railway in twenty minutes, about a mile from Blackheath, and in the midst of a healthy and highly popular district, comprising a most commodious Family Residence, with two lodge entrances, stabling, charming pleasure grounds, and well-timbered miniature park, let on yearly tenancy of £280 per annum; together with beautifully undulating pasture land, extending from the Charlton-road with long frontage thereto, to Victoria and Invicta roads, Westcombe-hill, the whole comprising 35 acres. The estate is immediately ripe for development, and offers exceptional facilities to capitalists for the creation of ground-rents, and the demand for middle-class houses in this favourite locality assures successful building operations.

MESSRS. BEADEL, WOOD and Co. will SELL by AUCTION, at the Mart, Tokenhouse-yard, London, E.C., on TUESDAY, MAY 16th, at ONE o'clock precisely, the above valuable BUILDING ESTATE, in one lot.  
Particulars, with plan and conditions of sale, may be obtained of W. T. HARTUP, Esq., Solicitor, Norwich; at the Mart; and of MESSRS. BEADEL, WOOD and Co., 97, Gresham-street, E.C.

BLACKHEATH and GREENWICH.  
VALUABLE FREEHOLD BUILDING LAND.  
To Builders, Land Companies, and Speculators.  
A plot of valuable Freehold Building Land, ripe for the immediate erection of villa residences, situate in and having an important frontage of 172ft. to Westcombe-hill, within five minutes' walk of Westcombe-park Station, on the South-Eastern Railway, and only twenty minutes' ride from London Bridge, and containing about half an acre. With possession.  
A valuable Freehold Building Site, known as Combe Farm, available for the erection of first-class villas and shops, situate in and having a frontage of 300ft. to Westcombe-hill, and 200ft. to Milton-road, adjacent to Westcombe-park Station, and containing about 2 acres. Let on a yearly tenancy.  
A block of Freehold Building Land, of about 6 acres, with a frontage of 1100ft. to Horn-lane, near the Woolwich-road, and let on a yearly tenancy. Suitable for the erection of manufacturing premises.  
An important area of Freehold Building Land, situate adjacent to the Woolwich-road, ready for the immediate erection of houses and business premises, and containing about 26 acres. Let on a yearly tenancy.  
MESSRS. BEADEL, WOOD & Co. will SELL by AUCTION at the Mart, Tokenhouse-yard, London, E.C., on Tuesday, May 16th, 1899, at one o'clock precisely, in four lots the above valuable FREEHOLD PROPERTIES, being a portion of the estate of the late William Angerstein, Esq. Particulars, with plans and conditions of sale, may be obtained as above.

Forthcoming Sales for the year 1899.  
MESSRS. E. and H. LUMLEY (Lumleys, of St. James's House, 22, St. James's-street, London, S.W.) beg to announce the following days of SALE by AUCTION, for the forthcoming year, at the Mart, Tokenhouse-yard, E.C.; but, in addition, other dates can be arranged for special sales. Terms on application.  
Tuesday, April 25th      Tuesday, Aug. 15th  
Tuesday, May 23rd      Tuesday, Sept. 12th  
Tuesday, June 6th      Tuesday, Oct. 17th  
Tuesday, June 20th      Tuesday, Nov. 14th  
Tuesday, July 4th      Tuesday, Nov. 28th  
Tuesday, July 18th      Tuesday, Dec. 12th.  
Messrs. E. and H. Lumley announce in the advertisement columns of the "The Times" on Saturdays a complete list of their sales, which will include estates in England, Ireland, and Scotland, town and country properties, ground-rents, reversions, gas and water shares, stocks, &c. In cases where property is to be included ample notice should be given in order to insure due publicity.—St. James's-house, No. 22, St. James's-street, S.W.

By EDWIN FOX and BOUSFIELD,  
At the Auction Mart,  
On Wednesday, May 10th,  
At Two o'clock, in one Lot.  
MILL-HILL, Hendon.—Valuable FREEHOLD ESTATE, well situate, opposite the Mill-hill Station, on the Great Northern Railway, with capital service of trains to King's-cross, Moorgate-street, and Broad-street, and within eight miles by road of Regent-street. The property comprises nearly 60 acres of ornamentally timbered pasture land, with gentle, warm southern slope, almost entirely surrounded by parish roads, to which there is about a mile and a half of existing frontage, and great scope for rearing other leading thoroughfares. There is a substantial house known as Bittacy Farm, with a capital range of outbuildings. The estate in its present form commands a rental of £300 a year, and is capable of development by judicious building operations, or the reversion of freehold ground-rents. The land is exceedingly well circumstanced for the formation of through roads, and the creation of new frontages in addition to those already possessed.  
Particulars at the Mart; at Messrs. EDWIN FOX and BOUSFIELD's Office, 99, Gresham-street, Bank, E.C.; and of the Vendors' Solicitors, Messrs. SOAMES and THOMPSON, 12, Coleman-street, E.C.

THE SOCIETY OF ARCHITECTS.  
Founded, 1884; Incorporated, 1893.  
The SIXTH ORDINARY MEETING of the Society of Architects for the Session 1898-99 will be held at the Rooms of the Society, at St. James's Hall, Piccadilly, W., on THURSDAY, APRIL 27th, 1899, at 8 o'clock p.m., when a Paper will be read by ANTHONY SCOTT, Esq., M.S.A., on "THE ROUND TOWERS OF IRELAND: THEIR ORIGIN, USES, AND CONSTRUCTION;" and the Silver Medal of the Society awarded to W. A. Scott, Esq., will be presented.  
ELLIS MARSHALL, Hon. Sec.  
C. MCARTHUR BUTLER, Sec.

SANITARY INSPECTORS' EXAMINATIONS.—An Associate of the Sanitary Institute thoroughly PREPARES CANDIDATES for the above Exams. by correspondence; no books are required.—For particulars and testimonials apply, "Certified Coach," 31, Herbert-road, Plumstead, S.E. 3

ANSSELL and MALLOWS, Architectural Draughtsmen and Quantity Surveyors, 21, Buckingham-street, Strand, W.C.

R.I.B.A. EXAMS. PREPARATION, personally or by correspondence, in three, six, nine, or twelve months' courses. Architectural Lending Library. Special three months' finishing courses.—For full particulars apply to Messrs. HOWGATE and BOND, Associates R.I.B.A., Perchard House, 70, Gower-street, W.C. (close to the British Museum)

LAND SURVEYING and LEVELLING.  
A Course of EIGHT LECTURES (Wednesday evenings), and EIGHT FIELD LESSONS (Saturday afternoons). Commences April 26. Fee, £3 3s. MIDDLETON and CARDEN, 19, Craven-street, W.C. 1

MASON'S CHISEL, STEEL, 1 1/2 to 1 1/8 octagon, 12s. to 16s. per cwt.; Chisels, 6d. lb.; Best Cast Steel for Lettering Tools, &c., from 4d. lb.—E. DEALEY, Moore-street, Sheffield. 11

FOR SALE, about Thirty Tons of CAST IRON PIPING 3ft. diameter, consisting of Straight Lengths, Bends, T pieces, &c., quite new, having never been used, would be sold cheap. Apply, Box 1048, BUILDERS' JOURNAL Office. 1

APPOINTMENTS VACANT.

WANTED in an Architect's Office in Westminster, PUPIL. No premium required.—Address Box 549, care of Brown's, 17, Tothill-street, Westminster. 1

ARCHITECT'S JUNIOR ASSISTANT REQUIRED at once. Apply, stating qualifications and terms, to JAMES R. WIGFULL, 14, Parade Chambers, Sheffield. 2

A VACANCY has occurred in an old-established Brighton Architect's office for a PREMIUMED PUPIL. Good opening for a smart youth.—Apply "C. A. S.," BUILDERS' JOURNAL Office. 2

APPOINTMENTS WANTED.

YOUNG ARCHITECT, A.R.I.B.A., ASSISTS in the PREPARATION OF DRAWINGS, TRACINGS, &c., at his own Office.  
G. SCOREE, 23, Newman-street, W.

QUANTITIES prepared, specifications written, works measured, and variations adjusted by reliable London Surveyor. Over twenty years' experience. Special terms by arrangement.—"Surveyor," office of the BUILDERS' JOURNAL. 36

ARCHITECTS and QUANTITY SURVEYORS.—Temporary ASSISTANCE rendered in taking-off, measuring, &c., either by commission or the hour; reference given.—"H. R. A.," 30, Fontarabiaroad, Clapham Common. 1

QUANTITIES prepared and Specifications written, if desired, for architects and surveyors. Prompt attention given. Mutual Terms.—"J. F.," care of Venqs, The Broadway, Highbury Park, N. 1

CLERK of WORKS or FOREMAN of MASONS; experienced man seeks position as above; thoroughly reliable; excellent references.—Box 1037, BUILDERS' JOURNAL Office. 1

ADVERTISER (19), five years' experience, requires ENGAGEMENT in Architects' Office as IMPROVER; can trace, ink-in, and colour well; salary one guinea.—Address "A.," 114, Lothron-street, Queen's Park. 1

ADVERTISER, will be at liberty June 1st, requires POSITION as REPRESENTATIVE or GENERAL MANAGER of firm who manufactures building specialities, decorative line preferred; good draughtsman, designs, and used to Limited Companies' methods; moderate salary.—Box 1049, BUILDERS' JOURNAL. 3

BUILDER'S or SURVEYOR'S ASSISTANT. Good draughtsman; over eight years' experience in Manchester district; workshop, quantities, estimating, accounts, &c., desires CHANGE. London or district preferred. Aged 24.—SMITH, Rochdale place, Rochdale. 1

Patent No. 814.

# TO MASTER BUILDERS, CONTRACTORS, AND ALL ENGAGED IN STONE-CUTTING.

## J. G. FAULDS'

IMPROVED

# Multiplex Stone-Cutter.

*Any person manufacturing these Tools will be liable to prosecution for infringement of Patent.*

THESE IMPROVED TOOLS for stone-dressing combine lightness with great efficiency in working, with perfect freedom from the annoyance of bad sharpening, tempering, or other defects. They possess *double* the advantages of the AMERICAN TOOTHED TOOL, by having, in a handy and convenient form, double teeth, or a chisel and "tooling drove" combined, the efficiency and economy of which a PRACTICAL MAN WILL SETTLE IN A FEW MINUTES.

The outstanding merits of the MULTIPLEX STONE-CUTTER are its simplicity and economy. They are simple in construction. The Handles are made with a slot (see below) in which the Cutter is inserted, and the Tool is complete. There are no screws or joints in the Handle to give trouble in fixing or removing the Cutter. They are economical. By the use of these Tools a great saving is effected, all the loss of time, trouble, and expense incurred in getting the ordinary tools sharpened being avoided.

Owing to the handiness and durability of these Tools they are in constant use throughout the whole of the United Kingdom.

Two sample Tools, with six Cutters, sent carriage free to any address in the Kingdom on receipt of a Postal Order for 2s. to the

SOLE INVENTORS, PATENTEES, AND MANUFACTURERS—

## An Architectural Causerie.

### Turner at the Guildhall.

THE remarkable popularity of the Turner Loan Exhibition at the Guild-

hall during the first weeks of its opening, makes one wish, perhaps ungenerously, that a more representative collection could have been made of a master so little known to the average Art-amateur of to-day. To give any adequate idea of his genius would have meant at least the bodily transplanting of the Turner rooms at the National Gallery, to which the present display is best regarded as a supplement. But in fact the Corporation would have been safe to assume complete public ignorance of Turner's works, on the principle that one never goes to see what is always on view. Very few of the really immortal canvases are here; scarcely even the masterpieces, except perhaps the "Rape of Europa"—that audacious and splendid exercise in the style he perfected, on the joyous side, in the "Marriage of the Adriatic," and tragically in "The Wreck." But to the student, a collection showing so much of Turner's secondary achievements, so many phases of development and transition, is of exceptional interest and value. Indeed, it would be wise to send the beginner to the National Gallery, and the more advanced student to the Guildhall. The romantic treatment of architecture, in which—being once set free from his Corinthian pillars by the discovery of the Gothic—Turner remains so unapproachable, is not exemplified on any large scale, but we are grateful for the water-colour series dealing with our English minsters, castles, and historic bridges that belong to the valley and river scenery he specially loved. Here in the second room are the Yorkshire abbeys, the glories of the dales; and, beyond these, the magnificent "Warwick Castle," "Stonehenge," which Ruskin calls "the standard of storm drawing," and the Pool of Bethesda, Jerusalem, "from which," he says, he "first learned what architectural drawing was." To the average eye it is not so much the drawing as the colour—or should we say the drawing in colour?—of Turner's architectural landscapes that most appeals. He knows how to select and transfigure buildings that will show white in a mist, golden in sunshine, grey in rain. And these things under his touch become part of the landscape itself, as it were, the very blossoming of the earth and air of the place; revealing the material world with the "will and idea" of man playing upon it, vainly or triumphantly as Fate decides; and in that light he seems to

see the habitations of man, his ships, temples, and palaces, appearing and disappearing between land and sky. Against these, the scanty figures of builder and victim stand out as the epitome of the drama; the last cry of the child in the lap of the inscrutable mother of all. It is perhaps this sense of the unity of life in the midst of conflict that yields much of Turner's imaginative power. He shows us, the creator perishing with the work of his own hands, and both together striving with the elements—these also listless and unreasonable slaves of the power that

—With equal mind  
Sees man control the wind,  
The wind sweep man away;  
Allows the proudly-riding and the foundering bark.

No other painter has so gripped us with

people will ever be able to go to an exhibition of Turner's works without these copious extracts from Ruskin in their hands. The suggestion implies no ungracious attitude to the compilers of the present catalogue, who have made excellent choice of quotations calculated to impress the greatness of Turner upon the ordinary mind. But it is difficult to forgive the inclusion of examples of Reynolds, Gainsborough, Romney, and other "contemporaries" of Turner, as being implicitly illustrative of his "school." Turner belongs to no school, and cannot be bracketed with his contemporaries as belonging to the same period of English Art. Their only point of contact with him is on the borders of his "classic landscape" phase, where he was still adventuring with bygone shades, and feeling his way, through the conventions that lay to hand, towards the expression of new and individual power. To introduce the "Grand Canal, Venice," by David

AT THE ROYAL ACADEMY, 1899.

the inconsequent terror of natural calamities. In the face of destiny, he makes Nature play a part like that of a Greek chorus; and with an almost Coleridgean mysticism shrouds the catastrophe with "tortured vapour tossed up like men's hands, as in defiance of the tempest." It is not given to every great artist to have a Ruskin to translate his pictures into hardly less brilliant words; and it is well so; for most of them would quarrel more with their interpreters than with the public beyond. One wonders whether

Roberts, into the presence of Turner is either an impertinence or a very feeble joke. Perhaps the Hanging Committee thought it might help to show off the better things. The cynic may find comfort in the fact that the atmosphere in this last room is the least seductive of the series, for the festoons of its hideous purple-red wall-hangings are loaded with dust half-an-inch thick, and growing thicker daily as the carpet sends up a cloud of witnesses to the dire need of housemaids at the Guildhall.

E. W.

## On Reflection.

### New Views in London.

LONDON has two buildings which rank among the supreme monuments of human genius—Westminster Abbey and St. Paul's Cathedral. With regard to both these buildings, a notable thing has been happening within the past few months. By the removal of the old houses, which formed the King Street block at the end of Parliament Street, a new and splendid view of the Abbey has been opened up. As the pedestrian approaches Westminster from Parliament Street he has a glimpse of a beautiful picture, which, until recently, was in great part hidden from his sight, and which a few years hence will be partially hidden again. Similarly in St. Paul's Churchyard the pulling down of some of the buildings at the west end of Cheapside has disclosed a new view of the Cathedral, which enables us to realise in a degree hitherto impossible the noble proportions of Wren's masterpiece. Here again it is but a fleeting glimpse, for the land hereabouts is so enormously valuable that it is scarcely to be hoped that artistic considerations will prevail over the commercial instincts of a "nation of shopkeepers" to preserve for future ages the beauty that has just been revealed. A people of any artistic sensibilities would recognise that to hide from sight the full view of these majestic monuments by building them in with mean houses, is not less an act of vandalism than to despoil the fabric itself. It seems strange that our forefathers should not have taken some pains to set in a worthy setting the priceless jewels in their charge. We cannot, however, reform our ancestors, though we might, now that the opportunity presents itself, decline to repeat their errors. At Westminster, if we cannot leave the splendid vista absolutely unspoiled, we shall at least give our glorious Abbey a building of some dignity as its companion. But what of St. Paul's churchyard? Are we to have new shops on the site of those that are being pulled down? The right thing to do, from an aesthetic point of view, would be to continue the demolition, and entirely sweep away the whole block between the Cathedral and the north side of Paternoster Row. But that consummation, though devoutly to be desired, is, we fear, very little to be expected.

**A Vain Appeal.** THE good taste and attentiveness with which the citizens of Edinburgh guard and maintain the rare magnificence and beauty of their noble city is well exemplified in certain clauses of the Edinburgh Corporation Bill, which is engaging the attention of a select committee of the House of Commons. One of these clauses proposes to give the local authorities of Edinburgh the practical control of the advertising stations in the city, and to make it illegal to set up advertisements except under licence of the magistrates. The restrictions asked by the Edinburgh Corporation are more vigorous than those which were suggested in the late memorial presented to the L.C.C., for the advertisements which may be held admissible and outside the discretion of the authorities are only such (not being illuminated) as may be exhibited "within the window of a building, or within or on a public conveyance, or within a railway station." The reason which prompted the introduction of this clause is stated to be the growing disfigurement of the northern city by advertisements. But alas, the committee, while granting the corporation powers over hoardings and advertisement sites, withheld the more particular powers asked by the bill. No doubt there are certain considerations and principles in-

volved in the matter, which would justify the decision from a statutory point of view; yet we cannot but feel that this decision is characteristic of the callousness of a supreme legislative body, which sees the architectural ideal materialised in the Admiralty Buildings, admires the æsthetic qualities of a famous pickle factory, and requires the signed opinion of thirty initiated persons to be published in its own daily paper, before it will begin to believe that New Scotland Yard is at all a fine design. The temper of the Scottish people and their pride in their city will, however, do much to cure the evil for which legislation is denied them.

### What to do with "Gift Horses."

IN the absence of a Government department charged with the control of artistic and architectural matters, such as exists in France, it is well that private members of the legislature should constitute themselves censors and critics of such acts of the Government as have any bearing upon artistic matters. The Earl of Wemyss who, in the rôle of Art Critic to the House of Lords, fills a far more useful position than in that of arch-enemy of Socialism, raised a very interesting point in a question he addressed to the Premier last Friday. He asked whether the Government would cause a rough model of the proposed statue to Cromwell, and of the pedestal, to be put up on the selected site, so that people might judge of the artistic effect of the monument before they were finally committed to it. The plan has certainly many advantages; it is commonly adopted in France and America, and is not unknown in this country. But Lord Salisbury, who replied in the light, bantering tone he seems to adopt when artistic matters are under discussion (or is it only when Lord Wemyss is the questioner?) professed to believe that the adoption of such a plan would lead to a wrangling of critics from which no agreement would be likely to result, and he suggested that it was better to trust to the *fait accompli*, to put up the statue in the first place and leave one school of critics to accept it with enthusiasm and another to submit to it with resignation. But in regard to this particular statue Lord Salisbury said the Government could not promise to do what was desired as the statue was not theirs to deal with; he quoted the proverb about looking a gift horse in the mouth, and seemed to imply that a Government having accepted the gift of a work of art and provided a site for it, had nothing further to do with the matter. That surely is a curious doctrine. With all due respect to the ancient proverb, the best thing to do with a gift horse often is to look it all over, not in the mouth only, and try it in the shafts, and then perhaps to decline it with thanks. Have not disasters great and small befallen the too trustful recipients of gifts, from the days of the Trojans until now? We can conceive it possible that a good many so-called works of art might be offered to the Government by artistic cranks and others which it would be sheer madness not to reject. Of course everyone knows that Mr. Thornycroft's Cromwell statue will not come under that category, but as a general principle it is surely the duty of the Government, as trustees for the nation, to exercise the same discretion in regard to the erection of buildings and statuary presented by private donors, as in the case of those commissioned by themselves, and paid for with the public money.

**The Liverpool Architectural Society** has decided to ask the City Council to rescind the resolution of April 5th, with reference to the demolition of St. George's Church tower and spire.

## A "BUILDERS' JOURNAL" COMPETITION.

### DESIGNS FOR A COUNTRY HOUSE.

IN accordance with our announcements, we have arranged a competition, to be open to all our readers, for designs for a country house.

All intending competitors should read carefully the following details, which have been revised and amplified since the original announcement of the competition.

#### The House.

As the competition is intended to meet the requirements of an individual correspondent, we append a statement of his wishes and, in making the awards, preference will be given to designs which most nearly comply with the following requirements:—

"I want a house long and low, with a large square entrance hall, to be used as a comfortable sitting-room, a wide staircase, and a gallery going partly round hall, a dining-room and boudoir for a lady, about six bedrooms, and three servants' rooms, with comfortable offices, &c. I want something a little unusual, either dark stained wood and thatch, or old timbers and thatch, and all kinds of angles and windows."

#### The Site.

The house is to be built on a level site on the crown of a bank overlooking a large garden which is surrounded by woods. The grounds in which the house is to be built cover an area of 6½ acres, and are situated in the neighbourhood of Hythe. The house will face N.W., but the main entrance is to be at the back, facing S. The drainage runs N.N.E. The house is to be long and narrow; the roof may be thatch or tiles, but not slate; large eaves are desired. In addition to the requirements given above as to the rooms, it is desired that there should be a small study and two bathrooms—one in connection with the best bedroom. No stable is required. The cost of the house should be from £1,500 to £2,000.

Any intending competitor wishing to view the site can obtain the exact address by communicating with the Editor.

#### The Drawings.

The designs submitted may include a perspective view, as well as plans and elevations, and must be accompanied by a brief specification (that is to say, a description of the house and the materials proposed to be used). They may be drawn to any convenient scale, but must be inked in and be without colour or wash.

Drawings must be despatched so as to reach the Editor of the BUILDERS' JOURNAL not later than May 24th; they must be submitted under a motto, accompanied by the name and address of the competitor, in a sealed envelope.

The drawings will remain the property of their authors, but we reserve the right to reproduce any we think fit.

#### The Premiums.

Premiums will be awarded for the three best designs, viz.:—

First Premium ...	£21 0 0
Second Premium ...	10 10 0
Third Premium ...	4 4 0

The services of a well-known architect will be secured to act as assessor. The three premiated designs will be forwarded to our correspondent, who may commission the carrying out of one of them; but it must be understood that our responsibility in the matter ends with the payment of the premiums.

# ARCHITECTURE AT THE ROYAL ACADEMY.

BY OUR SPECIAL REPRESENTATIVE.

ILLUSTRATED BY C. E. MALLOWS.

IT is a curious and interesting fact that there exist many folks who seek each year and hope to find some signs that the phase of art called British is steadily improving, moving on towards the perfection which will ultimately fit it for its proper place in the millenium. That is a beautiful theory, but, unfortunately, it won't fit the facts. They seek each year to find annual expression of the idea within the Academy walls. Of course it goes without saying they seek in vain, simply because their search is based on mistaken premises. Art does not progress. It revolves with all things in a cycle where the first is no more or less perfect than the last. To say that art progresses is as wise as to say that the world is flat. But the circumference is so immense and deceptive that at times it looks as if progress were really there. The deception is heightened by the occasional appearance of some attractive genius, or a group of them who, by their own strength, lift things for a while out of the mire, only to sink back again when the power that raised them is lost. You can see that instanced in the Gothic Revival, when every

one in those days was sure it was tending towards better things; another movement towards the artistic millenium. To-day probably no one doubts, whilst admitting the genius and sincerity of the creators of the Revival, it caused more evil than any other "cult" in the History of Art. There are parallel "movements" of to-day, only we cannot, unfortunately, see them from the perspective point of view of fifty years hence. If we could we should cease to mourn with a certain artist this year that Architecture "gets no forrader." There can be no real advance in an imperfect cycle with a gap in it, where (at the gap), as Marcus Aurelius says—and we presume he included the "simple" architect—all things will be re-absorbed in the Deity and the cycle will be recommenced afresh. Why then should our friend worry himself if the architecture at the Academy this year does not realise his expectations? He should know it is unwise to expect anything.

After all, it is merely a matter of opinion whether the Academy is a "good" or a "bad" one, mostly dependent upon the placing of one's picture. And whether "good" or "better" proves nothing. Not being biased by having our pictures skied, or on the line, or hung at all, we are free to say that the exhibition this year is an exhibition of small things which have far greater interest than their larger neighbours. There are exceptions to this, of course, and the exceptions are very important. There is, for example, the new associate, Mr. Aston Webb's large drawing of the "Britannia Royal Naval College, Dartmouth"; an immense building costing about

a quarter of a million, which is to be placed on a charming and delightful situation, close to the old training ship "The Britannia," a well-balanced, dignified group, reminiscent of the art of Inigo Jones and worthy of its distinguished architect. The setting out and placing of the building amidst its picturesque surroundings is most effective and the planning shows a master's hand.

Another large frame contains the water colour drawing, by Mr. Alfred Waterhouse, of the addition to the Prudential Assurance Co's. building in Holborn Bars, which is merely a continuation in idea and detail of the present work with a large tower in the centre.

Another member of the Academy, Mr. T. G. Jackson, sends his "New Radcliffe Library, Oxford," which is not an exception by the way, and holds honourable place on the west side. It does that and nothing more!

We miss, and it's a great miss too, the work of our greatest living architect. Why will Mr. Norman Shaw not enliven the room by his genius as in the days of "Wispers" and "Adcote," of "Craggside" and "Dawpool"? There is nothing in the Academy to compare in interest and distinction with those works of his. No man could make the room more attractive to artists. If he would exhibit perhaps our despondent friend might smile.

Characteristic of its author is the Church of Cowley St. John, by Mr. G. F. Bodley, A.R.A., illustrated by an equally characteristic water colour drawing by Mr. H. W. Brewer, whose hand loses nothing of its old cunning in the treatment of subjects such as these.

Professor Aitchison, R.A., sends a water-colour drawing of his Assurance Building in Pall Mall, which is pretty well known by this time, and so does not call for special comment. What, however, does call for special notice is the interior view, a most beautiful water-colour drawing by Mr. S. D. Adshead of the Salle d'attente in the Guernsey States House design, one of Mr. Mountford's most recent and successful works. This design has much simplicity and restraint. An exterior view (No. 1769) is also exhibited but the drawing with its photographic accuracy is in unfortunate contrast to the free luminous and simply-treated interior. The latter is certainly one of the most attractive drawings in the exhibition.

The Lady Chapel, Holy Trinity Church, Chelsea, is another exception of a most inspiring character. The design and drawing here both contribute in nearly equal measure to make the picture the most distinctive and remarkable in the room. There will be a great variety of opinion as to the wisdom of clothing Sedding's red-brick piers with climbing sculpture or painted decoration—it is not quite clear which it is—but there can be no question as to the artistic success of this picture as a whole, or of the artistry of its authors, C. W. Whall, H. Wilson, and Louis Davis. If there were a few more drawings like this and Mr. Adshead's picture, we should at least attract some of the painters into the room occasionally by a fine glow of colour, if not of architecture.

Another large drawing, by Mr. Raffles Davison, illustrates the new archbishop's palace at Canterbury, which is at present being built for Dr. Temple by Mr. W. D. Caroe. Here was a splendid opportunity—almost unique—of producing as fine a group of buildings as is possible in these days, in complete harmony with the grand old Gothic stones, as ever fell to the lot of a fortunate architect. We imagine there will be not a few artists who envy Mr. Caroe his work at such a place.

Mr. John Belcher has a very strong series of exhibits this year, the most notable, perhaps, being a very beautiful model of the upper portion of the tower of Colchester Town Hall—a refined and effective piece of work. In justice to its author, however, the name of the modeller should be given. The interior of the Council Chamber of the same building is shown by a lovely water-colour drawing, modestly labelled "A Diagram," by Mr. Joass. On the opposite side of the room is an interior by the same artist, where the decorative treatment is almost identical with that in the Colchester Council

Chamber; it illustrates an interior of the Hall at Brankston Castle, Dorsetshire, and the architect is Mr. Shekelton Balfour.

Mr. Leonard Stokes, always interesting and attractive, has a small drawing of a very large building, "New Convent, Colney, near St. Albans," a vigorous and masculine piece of Gothic work which is, nevertheless, more Stokes than Gothic. The whole design, both in plan and grouping, is handled in a masterly way. Mr. Stokes has done no better work than this, which is a refreshing pleasure to examine. Notice the delightful manner in which he has treated the quadrangle, and the fresh and original and yet simple treatment of the bays of the cloisters. Here surely is an artist's hand. The illustration by Mr. Frank Green deserves notice for the careful, effective, and sympathetic rendering of the subject. Mr. Stokes' other exhibits are "Addition to Soot Pray Farm," a charming treatment of additions to an old house, "2, West Drive, Streatham Park," showing the entrance front, hall, and drawing-room, and another very effective house design, square in plan and Georgian in treatment, but with that individuality one always finds in Mr. Stokes' work. All these are illustrated by Mr. Lucas in quietly treated pen drawings.

The Academy every year, with a humour everybody understands and appreciates, presents riddles for our amusement if not instruction; this must be so, otherwise how are we to account for such an exhibit as No. —. Well, no, we won't give the number; but we might

ask whether it was the drawing of the harmless sheep from the ark, or the in-offensive wooden horse which placed this frame upon the line or near it? As a comic rendering of animals this drawing is immense, but as an illustration of architecture it passes all understanding. Then, again, before the drawing below it, representing a huge pile of building in Whitehall, next the Banqueting House, we are speechless, awed by such a fearful waste of time and effort as this. It is said to be an example—a dreadful example—of “official architecture” (whatever that may be). We should suggest that the “officials” who produced this kind of “architecture” would be better employed at their old pastime of chloroforming the domestic fly. At least they would be kept from irritating

Messrs. Lanchester, Stewart, and Rickards also exhibit their design for the Godalming Town Hall, a capital design, admirably planned, which easily won the competition. The illustration is an effective wash drawing by E. A. Rickards. Another excellent design is that of the new Town Hall, Henley-on-Thames, by H. T. Hare, illustrated by C. E. Mallows. This is a very clever and interesting treatment of Renaissance work, with the parts well balanced, and the plain wall spaces effectively placed. Certainly one of the best designs Mr. Hare has yet done. The only criticism one feels tempted to make is that the Town Hall idea is not very clearly expressed.

As we have already suggested, a very high level of interest is reached in the collection of exhibits of domestic and semi-domestic work.

AT THE ROYAL ACADEMY, 1899.

their fellow creatures with such productions as this, to say nothing of the saving in good pens, ink, and paper.

To come gently back again to the subject, there is a large drawing (an exception which is not an exception) of “The Union Church, Queen Square, Brighton,” by Mr. J. W. Simpson, showing the institute, church and church parlours. The church is octagonal on plan, and crowned by a huge dome. The drawings (save the interior) are by Mr. Raffles Davison.

One of the best exhibits is a large pen drawing, very crisp, bright, and telling, illustrating Messrs. Lanchester, Stewart and Rickard’s design for the entrance to the New Law Courts at Cardiff, a strong and powerful piece of work, which well sustains their reputation. This portion of the design has evidently been revised and re-considered to a great extent since the competition, and has gained naturally a good deal by it. When completed, Cardiff will possess as fine a group of public buildings as any in the country, if the design and detail of the rest be equal in strength and power to this portion.

Chief in this is the most delightful model by Mr. Prior of his “Country House,” a fascinating study, which holds one’s interest in such manner that you return to it again and again, each time to find it more charming than the last. The plan, with the rooms arranged around a small courtyard, where is a kind of cloister as well, is very original and daring, and creates in the exterior points of picturesque beauty at nearly every corner. It is most artistically placed diagonally with the charmingly designed lines of the garden which surround it. We hope to give some sketches of portions of this model in our next issue.

Amongst the other notable pictures of domestic work are those contributed by Messrs. Bedford and Kitson of Leeds, who send some beautiful water-colours drawn by F. W. Bedford. One in particular is that showing a design for stables, with half-timbered gables at each end, and a broad expanse of unbroken wall between is made the subject of a fine water-colour drawing, showing an effect of evening light most ably treated.

In their exhibits 1791, 1695, and 1825, Messrs.

Hall, Cooper, and Davis contribute work excellent in design and admirably illustrated. To these and other exhibitors, such as Messrs. Niven and Wigglesworth, who send 2; A. N. Prentice, 3; C. E. Mallows and Grocock, 6; Frank Selby, P. A. Robson, Baillie, Scott, 4; Walter Millard, Beresford Pite, Harrison Townsend, we shall return in our next issue and give full details, a task which will be a pleasure, because all the work is so good.

## SOCIETY OF ARCHITECTS.

### ANNUAL DINNER.

THE fifteenth annual dinner of the above society took place on Wednesday evening last at St. James’s Restaurant, Regent Street, W. The president, Mr. T. Walter L. Emden, J.P., L.C.C., occupied the chair, the vice-chairs being taken by Mr. Silvanus Trevail, of Truro, and Lieut.-Col. F. Seymour Leslie, R.E., vice-presidents, and Mr. H. G. Quartermain, treasurer, and among the guests present were the Right Hon. E. Carson, Q.C., M.P.; Sir David Evans, K.C.M.G.; Sir Jas. D. Linton; Mr. J. A. Rentoul, Q.C., M.P.; the Very Rev. Dean Langton Geo. Vere; Mr. T. L. Corbett, Vice-Chairman of the London County Council; Mr. J. Claxson Preston, Master of the Carpenters’ Co.; Mr. P. A. McHugh, M.P.; Mr. Andrew Murray, the City Architect; Mr. Charles Welch, the City Librarian; Mr. W. T. Madge; Mr. Joseph Randall, the President of the Institution of Builders; Mr. Ellis Marsland, hon. secretary; Mr. C. McArthur Butler, secretary. Letters of apology for absence were read from the Lord Chancellor, Mr. Alherley Jones, M.P., Mr. E. Flower, M.P., Alderman R. Hind, and others. “The Houses of Parliament” was proposed by Sir D. Evans and responded to by Mr. Carson, Q.C., M.P., who said he felt himself in a congenial atmosphere, as he was the son of an architect, and was himself intended for the profession, but did not pursue his studies in that direction very long. The time he had spent at architecture he did not, however, consider wasted. The first brief he held had to do with architecture and building, and he found his technical knowledge of the subject a great help for getting round the idiosyncrasies of judge and jury. In replying to the toast he had to be impartial on all sides, and he was thus confronted with a difficulty. The House of Commons were the representatives of the people, and so long as the members fulfilled their obligations towards the people, so long they performed their duty as men. He was not sure that either House had done much for architecture, or had even discussed the question as to a greater symmetry of the buildings which might adorn their cities. A Scotsman did once in the House put a question as to who was responsible for certain inartistic gargoyles which had been set up. The First Commissioner of Works, who replied to the question, said that he was not responsible for any ugly appearances either outside or inside the House.

Mr. Corbett, responding to the toast of “The London County Council,” referred to the criticism with which the designs for the Vauxhall Bridge had been received, and said that he could only congratulate himself that the tide of criticism had rolled somewhat further down the Thames, and that the County Council for once found itself in the respectable society of the Dean and Chapter of St. Paul’s.

Mr. Rentoul proposed the principal toast, and the president in reply, said that the first aim of the society was to achieve the registration of architects. They were the only profession which dealt much with the health and wealth of the people, and was not directly recognised by the State. Architects were left in the position that anyone could put up a brass plate and call himself a member of the profession. Whenever registration was brought about it would do much to prevent the intrusion of the false and erroneous in architecture and benefit the public at large as well as the profession. Many other alterations in the law were also called for.

Mr. Silvanus Trevail, in proposing "The Arts and Crafts Allied to Architecture," observed that the British Government and our municipalities were deplorably mean and stingy in the amounts allotted for public buildings and their decoration as contrasted with the public spirit displayed in all architectural and decorative matters in the United States, France, and Austria.

Sir James D. Linton, who responded, said, when he recalled the position of the allied arts and the advancement that had been made by private means and opportunities in spite of many drawbacks, they had much to be proud of. The relation of the decorator and the architect was an interesting point. It had been said that the decorator should be under the direction of the architect. That was a right conclusion, but it should not exist, because in the old days there were no painters or decorators who were not just as able architects. Among a number of instances the name of Michel Angelo might be mentioned as a painter or decorator-architect. There was a difference of feeling among architects and painters, and by closer comradeship painters desired to overcome this difficulty.

The remaining toasts were "The Visitors," given by the president, and acknowledged by Mr. J. Claxson Preston, and "The Press," proposed by Lieut.-Colonel F. S. Leslie, and responded to by Mr. W. T. Madge of "The Globe." The musical programme was under the management of Mr. Albert Fox.

## HOUSING OF THE LABOURING CLASSES.\*

By P. FYFE.

(Continued from page 169, No. ccxix.)

NOW, what may be fairly considered the "due proportion" which a labouring man or a poor person should pay out of his weekly wage for rent? From an inquiry, which was conducted by Professor Mahaim in the town of Liege in Belgium, extending over 1276 representative houses, it was found that while the average household income of each tenant was 17s. 4½d. per week, the average rent paid by each was 2s. 3½d. per week. As this represented a payment by the labourer of 14 per cent. of his wages for house rent, Professor Mahaim stated he considered this proportion too high. In conducting a similar inquiry among the tenants of our ticketed houses in Glasgow, I caused an investigation to be made (1) of the present number of these houses of our poorer classes, (2) of the cubic feet of air space each contains, (3) of the rents paid in each case, and (4) of the weekly wage earned by such households. Of course it will be understood that the last return, being personal in its character and based on information given by the tenants themselves, allows room for error, yet I believe it is approximately correct. I think we may claim the 78,300 persons now inhabiting the ticketed houses are mainly our poorer respectable labouring classes mingled with that unfortunate residue of drunkards, prostitutes, and ne'er-do-wells generally, which unhappily infest, like a cankerworm, the populous centres of all large cities. Of course, there are besides these 78,300, as many as 361,298 men, women, and children in this city dwelling in one and two apartment houses which are not ticketed.

### Statistics of Glasgow Tenements.

At this present day in Glasgow there are 14,946 single-room ticketed dwellings sheltering about 49,000 inhabitants, and 6283 two-roomed ticketed dwellings, occupied by 29,300. These are the people who sit precariously in their homes, liable at any moment to be ousted therefrom by the edict of the Health Committee, or by a future improvement scheme launched and carried out by the Improvement

Trustees. The average cubic air space of these 14,946 one-apartment houses is 1323, or legally sufficient for three adults, or two adults and two children under ten years old. The average rent paid for these dwellings is 8s. 2½d. per month, ranging from 7s. 9d. per month in the Central District and in Maryhill, up to 9s. 2d. per month on the south side of the river. Ten years ago there were 16,413 of such houses, with an average rent of 7s. 11d. per month. The 6283 two-apartment ticketed houses contain on the average 1848 cubic feet of air space, and are rented at 10s. 10d. a month, ranging from 10s. 1d. and 10s. 2d. in Maryhill and the Central District respectively up to 11s. 10½d. in the Western District of the city. Such houses may legally accommodate four adults and one child, or two adults and five children under ten years of age. Ten years ago the number found was 6613, rented on the average at 10s. 3d. per month. All such rents include payment for stair gas and water. These rents reduced to weekly payments are respectively: one room 1s. 10½d. per week; two rooms 2s. 6d. per week. The average earnings per week of the one-apartment house tenant is found to be £1 0s. 6½d., and of the two-apartment tenant £1 6s. 5½d.

### The Tenements and their Inmates.

Working out these average figures, we find that our poor are paying 9½ per cent. of their earnings in the one case and 9½ per cent. in the other for house accommodation. Taking this against Professor Mahaim's 14 per cent., as found at Liege, Glasgow may be congratulated. But we must not deduce too much from averages, and we cannot forget that the house accommodation under consideration is of the meanest description, much of it in backlands where the air is confined and readily polluted,—where light enters only indirectly—and where outlook or window view is restricted to a stone or brick wall from 8ft. to 14ft. distant. Moreover, the average figures placed as the labourers' income are greatly disturbed by persons found living in these houses who are not poor labourers, but are tradesmen and artisans of the better class, whose household weekly earnings run from 30s. up to 66s. Private landlords do not make any inquiry into the earnings of their tenants, further than assuring themselves, as best they may, that they can pay in advance their monthly rent. Hence we find numerous examples of men and their families in ticketed one-apartment houses who earn such weekly wages, while in the two-apartment houses it is common. It is next to impossible to offer a true explanation of the conduct of men who with 35s. to 45s. weekly condemn their little ones to a life in the unwholesome slum.

### An Important Question.

These considerations suggest the question: Why are those dwellings existing at all, to which, dismal and unwholesome, these men may drag their wives and offspring? Why are even the poorer labourer and casual worker compelled by their own and outside circumstances to resort to homes such as we have described, such as may be seen by any of us any day? Such is the question that is ringing at present through the land. It was asked last summer by many voices in Dublin at the Conference of the Royal Institute of Public Health; it was asked last autumn in Birmingham at the Conference of the Sanitary Institute; it was asked a few months ago at the Glasgow Philosophical Society by my friend Mr. John Mann. In each case the solution of the question was the same, viz., that corporations, municipal authorities, sanitary authorities, must wrestle with the problem, close all insanitary houses, and build labourers' dwellings, light, airy, and wholesome, and rent them at rates within the paying capacity of the poor, and this even at the risk of a deficit to be made up out of the general rates. Before endeavouring to lay down a basis for the solution of this great problem on lines of experience, and as exactly as the science of land and house rent will allow, I ask your attention to the present position in this city and to correlative facts surrounding the occupancy of the one and two-apartment houses here.

### The Position in Glasgow.

In Glasgow there are now, I am informed, 69,000 two-apartment houses and 36,000 one-apartment houses, or, in all, 105,000 such humble dwellings, estimated to contain 439,598 of our total population of 700,382 souls. I am also informed that at a very recent survey 1500 of the former houses and 1200 of the latter were found unoccupied. But out of this total of 2700 unoccupied houses, only 480 are rented at £6 per annum and under. Putting 10 per cent. of their earnings as the amount labouring men may reasonably be expected to spend in house rent, we find the above number of unlet houses is all that they could find, if the authorities, either as Health Committee or Improvement Trustees, closed the doors of their present cheap abodes. Moreover, if we look at the problem sectionally it is found that in certain districts any sensible disturbance of these people would be calamitous. For example, on the whole south side of the river there are only thirty-six such low-rented houses, while in the whole west end of the city from Buchanan Street and Port Dundas Road, excluding Maryhill, there are only eighty-two. These facts show how fatuous it is to speak about the Health Committee carrying forward meantime a strenuous closing policy until blocks of sanitary dwellings are provided for the people to be disturbed. No one with an intimate knowledge of the remaining slums of the city, and the dark, dismal apartments to be found there, could withstand the conviction that much clearing work still remains to be done, but at present our hands are stayed. Since the year 1890, when special powers were given to the Health Committee to close insanitary houses, about 600 have been closed, and 1500 persons have been scattered to find such dwellings as they could. But latterly the task has been a painful one, in the face of the appeals of the poor people, and their sad anxiety, born of of the growing difficulty to find a new home at a rent low enough for their means.

### The Classes to be Provided for.

While endeavouring to show that the Corporation should at once proceed to build suitable blocks of labourers' dwellings at low rents, I also wish to clear away any impression that such dwellings ought to be erected for and tenanted by the dissolute and profligate of our lower population. I know that is the notion of some social reformers in industrial housing. A little reflection will show even the most ardent reformer that for those whose habits of life are known and proved to be vicious and destructive, no person, not even a benevolent municipality, can safely provide good and habitable houses. But there are two classes closely mixed up with these I have been speaking about, for whom every municipality should care in the most sedulous manner—viz., the respectable poor who have some furniture, and those who, through stress of circumstances or ill-health, have had gradually to sell off their belongings, and are left with little or no domestic stock-in-trade. Of the first class little need be said. They are for the most part the dumb class, fighting with poverty in silence—people whose small houses, ill-situated as they are and full of defects, are yet clean, and often bright with plates, cups, saucers, and cheap glasses shining on the shelves. Only when closely pressed are their poverty and complaints made manifest, and, painfully aware of their circumstances, and grieved at the rowdiness of neighbours unlike themselves, these "rather bear the ills they have than fly to others that they know not of."

(To be continued.)

Devonport Isolation Hospital, situated at Bladderley, is in urgent need of enlargement. The Local Government Board opposed this in 1894, as the proposed buildings were not considered to be a sufficient distance from the boundary and other buildings. They have, however, just withdrawn their opposition, and the buildings will probably be proceeded with shortly.

\* A paper read before the Glasgow Architectural Society.

# R. I. B. A.

## THE ANNUAL REPORT.

THE annual general meeting of the Royal Institute of British Architects was held on Monday evening, at 9, Conduit Street, W. The minutes of the previous meeting having been read and confirmed the annual report was considered, from which we have selected the following points as being most likely to be of interest to our readers: Since the last annual report, on May 7th, 1898, twenty meetings of the council have been held, of which the council elected on June 6th, 1898, have held seventeen. These are exclusive of meetings held by committees of Council. In the course of the year twenty-five Fellows have been elected, thirty-one Associates, one Hon. Fellow, one Hon. Associate, and one Hon. Corres. Member. Of the twenty-five Fellows, eleven have been elected by the Council under the new proviso to Bye-law 9, six being presidents of allied societies, and five having been unanimously recommended by the councils of allied societies. The numbers in each class of subscribing members stand as follows:—Fellows, 612; Associates, 1003; Hon. Associates, 47. Preliminary and Intermediate Examinations were held in June and November, 1898, in London, Birmingham, Bristol, Manchester, and York, and Final Examinations in London. The number of passes were as follows:—Preliminary Examination: Summer, 58; Autumn, 46. Intermediate Examination: Summer, 53; Autumn, 32. Final and Special Examinations: Summer, 15; Autumn, 16.

During the year 196 gentlemen have been registered as Probationers, the number of whom stands at 1098; and 85 as Students, the number of whom now stands at 303. The Annual Dinner this year is to be held on Tuesday, 27th June, in London, at the Whitehall Rooms, Hôtel Métropole. Since the issue of the last annual report, the Aberdeen Society of Architects has been admitted to alliance with the Royal Institute. The Council have taken public action with regard to the New Vauxhall Bridge and the Local Government Bill. Special Committees of the Institute are at present sitting to consider respectively the following subjects: The holding of the Institute Examinations in the Colonies; proposals by the Association of Technical Institutions that certain certificates of the Science and Art Department should exempt from portions of the Preliminary and Intermediate Examinations; the administration of Building Bye-laws in rural districts. At the request of the Court of Common Council of the City of London, the Council have nominated six architects to send in designs for the new Sessions House, Old Bailey. The Council announce that since December 31st they have been enabled to invest £1,500 in Tasmanian Government 3½ Per Cent. Stock.

### Report of the Art Standing Committee.

The Art Standing Committee report that they have held seven meetings since the publication of the last report. Mr. Alfred Waterhouse, R.A., LL.D., was re-elected chairman; Mr. Macvicar Anderson, vice-chairman; and Messrs. E. W. Mountford and Owen Fleming were reappointed hon. secretaries. ST. PATRICK'S CATHEDRAL, DUBLIN.—Plans and particulars of proposed additions to St. Patrick's Cathedral, Dublin, were submitted to the Committee, who were asked to state: (a) Whether the addition of modern building to the Cathedral was legitimate and reasonable; (b) whether the plan submitted was sufficiently conservative and considerate towards the original plan of the thirteenth century. The Committee (a) determined that, assuming additional accommodation to be necessary for the efficient performance of the services of the Cathedral, it would be legitimate and reasonable to provide it; but (b) suggested a modification in the proposed grouping of the buildings. KEW BRIDGE.—The Committee, having had this matter under their consideration, urgently recommended the adoption of granite or stone as the material for the bridge, and, by the instructions of the

Council, the Secretary wrote to the County Councils of Middlesex and Surrey conveying this recommendation. In reply the Institute was informed that stone would be used. VAUXHALL BRIDGE.—This subject has received further consideration, and, as the result of some correspondence between the Secretary of the Institute and the Chairman of the London County Council, the Chairman (Mr. Waterhouse, R.A.), with Messrs. Statham and Mountford (hon. secretary), waited upon the Chairman of the London County Council and stated their views as to the design prepared by Sir Alexander Binnie. HISTORIC BUILDINGS IN LONDON.—At the invitation of the London County Council the Committee invited Messrs. Brydon, Mountford, and Young to represent the Institute at a Conference held by the Council. The Conference determined to prepare a register of all buildings of architectural or historic interest in the County of London, and a Committee was appointed, of which the Hon. Secretary of the Committee is a member. FLORENTINE MONUMENTS.—The attention of the Committee having been directed to extensive alterations that appeared to be contemplated in the ancient quarters of Florence, steps were taken to assist the English Committee who had been appointed to deal with this matter. Signatures were obtained from members of the Institute and its Allied Societies to a memorial of protest, which has been presented to the Municipality of Florence. ARTISTIC COPYRIGHT.—The Committee have had under consideration the questions of Artistic Copyright, and Messrs. Statham and Caroe were appointed to represent the Institute at the Conference. DECORATION OF ST. PAUL'S CATHEDRAL.—This matter is engaging the attention of the Committee. The following subjects have also received the consideration of the Committee:—Portrait of Sir William Chambers; Trinity College, Dublin; the Casino at Mont Saint-Michel; the Protestant Cemetery at Rome; the Kapell-Brücke, Lucerne; and the proposed Arts and Crafts Exhibition.

### The Report of the Literature Standing Committee

states that the Librarian has now completed the Supplement to the Brandon Catalogue up to the end of the year 1898. The catalogue is in type, and will shortly be issued to members. The Librarian reports to the Committee that during the twelve months ending March 31st of the present year 262 volumes and twenty-four pamphlets have been added to the library of the Royal Institute, exclusive of periodicals, reports, and transactions of societies, and parts of works issued in serial form. The number of volumes presented to the reference library was 169. The works purchased comprise ninety-six volumes, out of which sixty-one volumes were added to the loan library. The attendances of readers and borrowers during the year numbered 4241, the number of works issued on loan being 1163. The number of volumes consulted in the reference library during the year was 6322.

### Report of the Practice Standing Committee.

The Practice Standing Committee report that the usual monthly meetings of the committee have been held. Mr. J. Douglass Mathews and Mr. Thomas Harris were re-elected chairman and vice-chairman respectively. Mr. J. Osborne Smith and Mr. C. H. Brodie were elected hon. secretaries, Mr. Smith taking the place of Mr. Woodthorpe, who resigned. The points raised on the Institute Conditions of Contract referred to in the last report, and also other important questions on these conditions, referred to the Committee by the Council were fully considered, and reports thereon sent to the Council, special attention being called to the decision in the Court of Appeal in the case of Dodd v. Churton (March 19th, 1897) as affecting all contracts. The Lords Justices decided that the giving of extra work nullified the time for completion clause and consequent fine for non-completion. A report was also sent to the Council on the question of the liability of architects for licence as appraisers, intimating that, in the

opinion of the Committee, they are not in ordinary practice liable to this tax. The consideration of the Revised Schedule as to the professional charges to be made by architects was continued and concluded, and the proposed new schedule sent to the Council. After amendment by the Council, assisted by the Chairman and Vice-Chairman of the Committee, this was finally ordered to be issued as an Institute paper at a Special General Meeting on June 27th, 1898. The Schedule, as finally amended and adopted and issued, was printed in the Institute "Journal" of July 23rd, 1898. At the request of the Committee the Council have agreed to obtain counsel's opinion as to the liability of architects under the new Workmen's Compensation Act, and a list of questions to be submitted to counsel was drawn up by the Committee. A suggestion that the Committee should be allowed to interview and advise members of the Institute as to difficulties arising in their practice was not agreed to by the Council, on the ground that this work was already undertaken by one of their own committees. The Committee have considered the London Government Bill, and reported thereon to the Council.

### Report of the Science Standing Committee.

The Science Standing Committee report that they have held six meetings since the publication of the last annual report, with an average attendance of eight members. Mr. P. Gordon Smith was appointed chairman; Mr. W. C. Street, vice-chairman; and Mr. H. D. Searles-Wood and Mr. Max. Clarke, hon. secretaries. The Committee are still awaiting the publication of the results of the experiments for the purpose of ascertaining the strength of different kinds of brickwork. The Committee, having reported to the Council on the subject of standardising the size of bricks to the effect that they should like the matter referred back to the Committee with a view to coming to an agreement with the Brickmakers' Association to fix the standard, appointed a sub-committee to meet a sub-committee appointed by the Institution of Civil Engineers, and a joint standard was agreed to by the joint committee and referred to the Association for discussion. The joint committee have not been able to meet to consider the replies of the Association owing to the absence from England of one of the members of the engineers' sub-committee, but it is hoped that the standard will be agreed on in the course of a few months. On the subject of building regulations for the purpose of reducing the liability of warehouses, &c., to destruction by fire, an interesting paper was obtained from Mr. R. W. Gibson, and read at a general meeting of the Institute. Further information is being obtained.

### Finance.

The accounts of ordinary funds for the year ending December 31st, 1898, show that there was a balance of income over expenditure of £1,241 9s. 10d., the income being £6,592 3s. 11d. The Council estimate for the twelve months of 1899 an income of £6,700, and a balance of income over expenditure of £1,100, exclusive of entrance and final examination fees.

The report having been read, scrutineers for the annual election of the Council and Standing Committees were elected, and auditors for the ensuing year of office were nominated. The meeting then appointed, under Bye-law 43, the Statutory Board of Examiners under the London Building Act, 1894, and other Acts of Parliament, for the ensuing year of office.

The next meeting will take place on May 15th, when Mr. H. H. Statham (F.) will read a paper on "The Architectural Element in Engineering Work," and not, as was previously announced, on "Nature and Architectural Ornament."

The Death of Mr. Joseph Wolf, the great animal painter, took place on April 20th.

The New Technical Institute at Selly Oak, Birmingham, is in course of erection. It will cost about £3,500, including £450 for the land.

## THE ARCHITECTURAL ASSOCIATION.

### SPECIFICATIONS.

AT the meeting of the Architectural Association last Friday evening a paper by Mr. F. W. Macey on "Specifications" was given. Mr. Macey was unable to attend, and Mr. G. B. Carvil read the paper. The president of the Association, Mr. G. H. Fellowes Prynne, was in the chair. It was announced by the secretary that the scrutineers of the votes for the election of the committee were Messrs. W. A. Jeckells, A. Smithiers, and W. A. Webb.

Mr. Macey's paper was as follows:—

There has been so much recently written upon the subject of specifications, that it is difficult to suggest any new or original ideas, and I fear that the few remarks I have to make may be somewhat wearisome to many present, and seem like going over old ground. But those who have not given the subject any special consideration may find some of the suggestions not wholly unprofitable.

And if further excuse is necessary, I do think that to hear a question discussed creates a more lasting impression than that of mere reading.

#### The Specification.

A specification may be either lengthy or curtailed, according to the particulars given upon the drawings. Some engineers favour a short specification and prefer to put as much written information as possible upon the drawings, one reason for this being that engineers usually supply a number of detail drawings with their contract plans, which enables them to put many notes upon those drawings. On the other hand, architects do not usually supply many detail drawings, consequently somewhat lengthy specifications are necessary.

To my mind, either method may be adopted if the requisite information be clearly given.

I can conceive of a set of plans prepared and written up so fully in detail that a specification as a separate document might become unnecessary; this sometimes happens in a certain class of work. On the other hand, I can scarcely imagine a specification so full in detail as to dispense altogether with the plans, unless it related to a very small and simple erection or to general repairs or decorations.

But without further discussing these two methods I would ask you to assume that both plans and the specification are necessary for general work; I will then suggest a form of specification which shall be curtailed and yet shall not detract from a full and clear description of all parts of the work.

A specification should not supersede the particulars given upon the drawings, but should more fully explain those parts which the drawings do not clearly illustrate, or which are in any way obscure. It is impossible to show every detail or give every particular upon the drawings, consequently a full description of those parts becomes absolutely essential in the specification.

I take it that the plans give the general arrangement of the building, and the specification should describe the details of that arrangement. The plans should have figured upon them every important dimension, such as the lengths, widths, and heights of the various distinct parts of the building; the thickness of walls; the depth and width of the concrete foundations; the sizes of floor joists, roof, and flat timbers; the widths and heights of doors and windows; and all other similar and important parts and items. It is seldom that plans to a small scale are so accurately drawn as not sometimes to be obscure with regard to the sizes of certain parts unless these parts are given in figures.

The only other particulars in writing to be put on the plans would be the names of the rooms and other parts of the building, together with any notes or references which might assist the description in the specification. With regard to small scale drawings, do not labour the elevations by showing every

brick and slate. Working drawings will be far clearer without too many lines, and there is no need to finish them like a picture.

But in the specification I would include everything except the general dimensions of the various parts of the building. Of course, the sizes of the joists and roof-timbers are always described in the specification, as well as sometimes being given on the plans; and I see no harm in stating the thickness of the various walls, the depth and width of the concrete under the walls, or any other detail of the building. A specification which is full but at the same time concise and to the point will prevent mistakes and misunderstandings when the building is in progress. Presuming, then, that the plans are before you, but not in too great detail, and that you have decided to write a rather full specification—what, then, is the first consideration?

You must have a complete knowledge of your subject—that is, a full grasp of the details of building construction, and of the value and properties of materials. In other words, you must know what you want to describe, and, knowing that, you must be acquainted with the

#### Requirements

attendant upon those wants; and you may take it for granted that until you are proficient in these matters you will never be able to commit to writing the proper descriptions needful to the erection of a building.

Therefore, I say that a complete knowledge of all the requirements and details of the various trades coming within the scope of the architectural profession is the first consideration to efficient specification writing; and I might also add a knowledge of the various Acts relating to buildings. But it may be said that it is impossible to know everything, and when in doubt the only way is to put a provisional amount to cover any such point, and to obtain afterwards the information from a friend or specialist. This is true, and may be the only course to adopt at the time, but ready and accurate knowledge will benefit all parties concerned.

The question then arises: What is the best way to obtain such knowledge? I know of only two ways, study and observation. What I do myself is first to read any works obtainable which bear upon any doubtful point, and I would also add that much useful information can sometimes be gained from trade catalogues. I then discuss the matter on every possible occasion with anyone I come across who has any knowledge of the subject, and, further, I keep my eyes open and learn all I can from what is going on around me. You have only to pass down any street where building operations are in progress to gain many practical hints.

#### The Draft Specification.

You now proceed to write the draft specification. This is often hurriedly written, much being left to alter and supplement when revising for fair copying. This is a great mistake. A draft specification should be written with care and thought. Being fresh to the matter, even so dry a subject creates a certain amount of interest, and if you concentrate your mind upon the subject you will be less liable to omit many small items. Therefore, let the first draft be as complete as possible.

I might suggest that when engaged upon the plans, it will be found of great assistance if notes are made of any obscure item coming under your observation at that time.

When sending out a number of fair copies see that they all agree.

#### Architect or Surveyor?

There is one matter which I should perhaps have referred to sooner. Should the quantity surveyor write the specification for the architect? In the abstract it seems absurd to ask such a question were not this practice so frequently followed. Personally, I think the architect should write his own specification, and not delegate the work to another. A quantity surveyor cannot know what is in the architect's mind, therefore it is

impossible for him to describe fairly that which embodies the architect's best ideas. It is unjust to the quantity surveyor to ask him to attempt to do so. It is also unjust to the client, and the architect has no right to accept payment for work done by another. One other word with reference to the quantity surveyor. When he takes out the quantities it is usual for him to make notes of any omitted items on the architect's specification. Should he not do so, however, the architect must run through the bills of quantities and adjust the specification to them before the contract is signed. Reverting to the subject-matter, a full specification will save many an anxious moment. Constant disputes occur with the builder, many extras crop up owing to imperfect wording and omissions—ordinary care would prevent all this. And remember always that a specification is a legal document.

Bearing somewhat on this incomplete description of work, attention might be called to the fact that one so often sees in a specification wording to this effect:—"That the builder is required to perform a certain work all complete," or "all as required," or "as necessary." This generalising shows the architect's ignorance of what is required; and it is not reasonable to ask a man to estimate for something of which you yourself do not know the requirements. Consequently, you either get an unfair estimate or an incomplete work, or else a squabble ensues with the builder as to what was intended or required. Should you ever be in this difficulty of not knowing what is necessary, then the best plan is to put a provisional amount and let the item work itself out in execution. Therefore, let your terms be definite and clear. Some make a great point as to which is the correct word to use, "provide" or "supply." I think it very unimportant. There certainly is a slight difference; but, at the same time, to provide you must supply, and to supply you must provide.

#### Describing the Work.

Agreeing, then, upon this point that a specification must be somewhat full, and, consequently, lengthy, what then is the best way to curtail the descriptions without detracting from the merits of the document. There are several ways. Many items which will apply to several parts of the building under similar conditions may be generalised. Thus, take, for example, the skirtings to a building. A general clause applicable to all skirtings may be inserted, somewhat to this effect: All skirtings to be rebated to floors, tongued and mitred at angles, tongued at heading joints, housed into architraves, returned and mitred at ends, and fixed to double splayed narrow-framed grounds with dovetailed backings and filling out blocks, and plugged to walls. The only further description then necessary will be to refer to each particular skirting such as:—

Attic skirtings 7in. by 1in. plain deal.

First-floor skirtings 9in. by 1½in. moulded deal.

And so on.

Here, then, the description of the fixings to each separate class of skirtings is avoided. In the same way the backings to door and window linings, and many other items where the conditions are similar, may be generalised.

Further, if any detail drawings are supplied with the contract plans, which I fear is not often the case, a specification may be much shortened without detracting from its efficiency by merely referring to the detail drawings in question, and at the same time mentioning any particular feature not readily gathered from those drawings.

Thus, in about three lines, may be stated all that is necessary, which otherwise would perhaps occupy a dozen or twenty. But I fear, until it is the custom to supply detail drawings with the contract plans, very much cannot be made of this point.

(To be continued.)

Whitgift Church has recently been opened after renovation and the addition of a new chancel, at a cost of £1,250.

## Bricks and Mortar.

EFFINGHAM HOUSE, ARUNDEL STREET,  
May 3rd, 1899.

"I know what it is to live in a cottage with a deal floor and roof, and a hearth of mica slate; and I know it to be in many respects healthier and happier than living between a Turkey carpet and a gilded ceiling, beside a steel grate and a polished fender. I do not say that such things have not their place and propriety; but I say this, emphatically, that the tenth part of the expense which is sacrificed in domestic vanities, if not absolutely and meaninglessly lost in domestic discomforts and incumbrances, would, if collectively offered and wisely employed, build a marble church for every town in England; such a church as it should be a joy and a blessing ever to pass near in our daily ways and walks, as it would bring the light into the eyes to see from afar, lifting its fair height above the purple crowd of humble roofs."—JOHN RUSKIN.

**St. Paul's: The Outlook Improving.** THE discussion about the St. Paul's decorations still continues. Among recent protesters is that useful body, the Society for the Preservation of Ancient Buildings. There seems a likelihood that at last the accumulated protests will prove at least in some degree effective. The Decoration Committee have abandoned their early policy of ignoring criticism. Lord Brownlow, a member of that committee in a recent letter to "The Times" said: "The views expressed by all who have taken an interest in the matter will be certain to receive the most careful consideration of the committee at its next meeting. I venture to express my conviction that the deep interest now taken in the Cathedral by all sections of the public will tend to render easier the task of bringing the decorations to a satisfactory conclusion, and, therefore, is a subject for congratulation to all concerned in the work." This is a striking contrast to, as well as a great improvement on some of the utterances of those responsible for the Cathedral decorations.

### The New Jamaica Bridge, Glasgow.

THIS bridge, which crosses the river Clyde at the foot of Jamaica Street, has been in the course of reconstruction for the last three years, and it will be formally opened during May. The former bridge was erected on the same site in 1835, from designs by Telford, and was said to be one of his best works. The arches are of granite throughout, while the piers are faced with the same stone, the granite of the old bridge being redressed and used again. To secure a reliable foundation all the piers and abutments have been sunk 60ft. below low water level, and from 20ft. to 30ft. below the foundations of the quay walls. Each pier is supported by four cylinders, each 15ft. in diameter, these being connected at low-water level by semi-circular granite arches, on which are built the solid piers which support the main arches. The wings and abutments are also supported by cylinders, those for the abutments being similar to those for the piers, but those for the wings being considerably smaller and built of brickwork instead of steel and concrete. The parapets are of polished granite throughout, and are the old balusters and copstones redressed and polished.

### An Old Devonshire Tower.

"Is Exeter to let one of her few remaining features of antiquity slip out of her hands and go for ever, or is she not?" This is a question asked by a correspondent of the "Exeter Flying Post" concerning St. Sidwell's tower. It is proposed either to destroy this most interesting fifteenth century tower, or to rebuild it from the clock face upwards. Our contemporary's correspondent says, "Renovate it, if you like, but keep it exactly as it was when our pious predecessors in the fifteenth century raised stone after stone upon lines directed by the master mason

himself." Perhaps, as is suggested, it would be better to let the old stonework remain, and where necessary in order to insure the stability of the tower, fresh stones, replicas of those which originally stood, could be added. This plan would be better than destroying an interesting relic.

### Star Castle, Scilly.

St. Mary's Island, in the remote Isles of Scilly, is being fortified. Not since the days that immediately preceded the Commonwealth have those islands been the scene of any warlike operations, and the most modern (so to call it) fort of any kind in the group is the curious redoubt built on the headland called the Garrison, above Hugh Town, in the time of Queen Elizabeth. This is a fortification with seven salient angles, called from its star-like ground plan, "Star Castle." It does not seem to have been injured when the Commonwealth Navy took possession of the Scillies. From the picturesque point of view, it is exceedingly interesting, but as a defence it has been, of

DRAWN BY C. G. HARPER.

course, for very many years past beneath contempt. The new forts now under construction on this plateau will overlook St. Agnes Island and the intervening roadstead, in one direction, and Hugh Town and its harbour in another. These are the only two means of approach to St. Mary's Island, the capital of the archipelago, and the guns will sufficiently cover the fairway to most of the other islands. Those that are not thus commanded may, from their wild and storm-beaten position, be safely left to their natural defences, the bristling reefs that encircle them, which have often brought many a good ship to destruction on this ill-omened coast.

### A Gladstone Tablet.

THERE is a talk of embellishing some one of the metropolitan residences of the late Mr. Gladstone with a mural tablet commemorating its connection with the most commanding figure of the present generation. One of these residences is in Harley Street, and was that occupied by Mr. Gladstone when his windows were smashed by a furious Jingo mob. We hope that this will be the one selected, as it will be a much more graceful memento of a regrettable incident than the iron shutters put up outside the windows of Apsley House by the Iron Duke to commemorate a similar outrage perpetrated upon him by a discontented concourse of Reformers in the early part of the present century.

### Fire Prevention.

A large fire generally results in a number of letters being sent to the Press which are of a more or less sound and practical character, and the fire at Hyde Park Court has produced an unusually large number. The Earl of Fortescue sends a letter to "The Times," in which he says: "Having determined to improve the arrangements for extinguishing fire, should any break out in my country house, Castlehill, I last year made on the hill close behind it a new reservoir (with the provision for keeping it full) holding 50,000 gallons, nearly 50ft. above the highest point of the roof, with a 6in. pipe leading straight down from it at a very steep angle for the supply of several standpipes and hydrants, with 2½in. hose outside the house, sufficient to command all the premises." This is a very fine arrangement—where possible. Mr. T. H. Baylis wrote on April 27th to "The Times" a letter which makes some good suggestions on the prevention of fire. A part of his letter runs as follows:—"I regret to say that in Government and other public buildings

the inside hydrants are not attached; it would take several minutes to bring them into action, when seconds are too valuable to be lost in adjusting them. I strongly urge the necessity for regular fire drills . . . and one of the drills ought to teach how to put out a fire in its infancy, by closing the doors and beating it out at once by rugs, mats, pillows, or other means usually at hand."

### The Abuse of Advertisement.

Under this heading a letter was published in "The Times," of April 26th, from Mr. Richardson Evans, Hon. Sec. of the National Society for Checking the Abuses of Public Advertising, 7, Great College Street, Westminster, London, S.W., in which he says that, "those who are interested in the efforts made to stay the plague of advertising disfigurement will hear with satisfaction that in an omnibus Bill, introduced by the Edinburgh Corporation, powers are sought for subjecting advertising display to municipal control. It should be said, for the honour of Ireland, that the Dublin Corporation attempted last year to establish a right of checking the grosser forms of the abuse, but were advised that, as the law stands, there is no authority to restrain. The action taken in the capitals of the two sister kingdoms may be paralleled by proceedings in many of the governing bodies of English cities. This circumstance is encouraging, so far as it refutes the strange superstition that the evil is regarded with indifference, while it ought to stimulate our own County Council to take prompt steps in the direction indicated by the architects' memorial, which is, I believe, still under consideration. It would not be respectful to the Private Bill Committee to speculate concerning the nature of their decision on the Edinburgh clauses. They are strongly opposed, of course, in the interest of certain trades. May I suggest that some, at least, of these timid worshippers of Diana of the Ephesians distress themselves superfluously?" In his concluding remarks, he says: "There is no fear—or ought I to say no hope?—that posters, 'artistic' or commonplace, will disappear. There will be plenty of room for them in their proper places. Can anyone seriously imagine that abundance of outlets for the advertising instinct will not be allowed under a system of control, administered by a council elected by the whole body of citizens?"

### St. Dunstan's Church, Fleet Street.

WE give the following abstracts from a letter in "The Times," of April 27th, sent by "a member of Fleet Street," hoping they will further the commendable intentions of the writer, who desires to call attention to a project that is on foot to interfere with the open spaces around St. Dunstan's Church. "The present Church of St. Dunstan in the West is, I submit, one of the most noteworthy features in Fleet Street. It was erected in 1831-32 under an Act of Parliament, whereby trustees were authorised to pull down the then existing church, acquire further land, and build a new church. The architect was Shaw, and, doubtless with a view to effect, open spaces were left on the east and west sides of the new church, and such spaces at the present day enable a clear view to be obtained of the fine Gothic tower which forms the principal feature of the building. To in any way interfere with these open spaces would, in my opinion, be an act of vandalism; yet it appears that on the 24th ult. an agreement was entered into between Harry Hoare, Frederick George Hilton Price, and Sir Christopher William Baynes, trustees under the above-mentioned Act, the Law Life Assurance Society (Limited), and the Rev. Henry Lionel James, the rector, and Charles Edwin Noverre and Edmund Seth Daw, the churchwardens, whereby, conditionally on a faculty being obtained, it was agreed to sell the open space on the west side of the church to the society to enable it to build thereon an extension of its offices." All interested in City churches and London street architecture will agree, we think, that to build on these spaces would be quite unjustifiable.

## Enquiries Answered.

The services of a large staff of experts, including all those engaged on "Specification," are at the disposal of readers who require information on architectural, constructional, or legal matters. Questions should in all cases be addressed to the Editor.

### DRAWINGS IN THE BUILDERS' JOURNAL.

In reply to H. M. F. (London, N.W.), who suggests that a further selection of measured drawings should be published in the BUILDERS' JOURNAL, we may say that a number of drawings of the kind desired are in hand for publication. We are always glad to receive suggestions from our readers.

### BUILDING CONTRACT.

To the Editor of THE BUILDERS' JOURNAL.  
HITCHEN.

DEAR SIR,—Could you inform me what my position is as regards a building contract? I signed a contract to restore and make certain additions and improvements to a mansion, and the extras and deviations were to be measured and valued by the architect, whose decision was (according to the wording of the agreement) to be final and binding. On the completion of the job I send in my bill of extras and the architect makes an award, which comes several hundred pounds below the amount of my claim. He positively declines to give me particulars showing how he arrives at his valuation of the extras, and I want to know what course is best to adopt under the circumstances. I only want what is just and reasonable, and am quite willing, and have more than once offered to meet him in the matter, or have it valued. Will you kindly give me your advice.

CONTRACTOR.

I do not think that "Contractor" has any remedy. He and his employer have delegated to the architect the duty of measuring the work done and valuing it. If the architect has, without fraud or collusion with the employer, performed his duty, the contract renders the result binding on both the parties to it, no matter how negligently or unskillfully the architect may have acted in the matter. The case seems a very hard one, and "Contractor" would do well to have the documents and full facts laid before counsel for his opinion.

H. P. B.

## Correspondence.

### BOOKS ON BRICK AND STONE WALLS.

To the Editor of THE BUILDERS' JOURNAL.  
LONDON, S.W.

SIR,—Your correspondent "Perplexed" (p.153, No. cexviii.), will find all the information he requires with regard to the thickness of retaining walls, counterforts, abutments, &c., in Hurst's Architectural Surveyors' Handbook. (Spon, Charing Cross, 5s.) an invaluable little work which should be in every surveyor's library. Mr. Hurst was a clerk of the Works in the War Department and had considerable experience in these matters. JOHN HEBB.

### FITTING UP AND SANITATION OF COW HOUSES.

To the Editor of THE BUILDERS' JOURNAL.  
ROCHDALE.

SIR,—With respect to the reply to the query on the above in your issue of the 12th inst., I beg to furnish the following additional references:—

"Specification," II., p. 477; III., p. 249.

"Sanitary Record," January 14th, 1898.

"Surveyor," April 1st, 1898, p. 340.

"Councillor," August 6th, 1898, gives letter from Local Government Board to Royal Agricultural Society on cubic air space registered and the recommendations of the "Royal Commission on Tuberculosis."

"Sanitary Inspectors' Journal," October, 1897, p. 105. S. S. PLATT.

### REGISTRATIONS OF ARCHITECTS.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—That there is a *prima facie* case in support of the belief that architects and the public alike would profit by an Act as indicated above, is shown by the fact that the professions already closed, such as Law and Medicine, &c., are unanimous in holding that they have very greatly benefited by legal Registration and we should like, in reply to the correspondent in your issue of April 19th, to point out briefly a few of the many ways in which the "Act for the Registration of Architects" now before Parliament, would benefit the profession of architecture.

First the pupil would have set before him some definite object in the shape of compulsory examinations, which must lead him to acquire the habit of concentrated study, the impetus for which at present only partially exists; having passed the examination, and being duly registered, the architect would step at once into that recognised position in the profession which is now only attainable, except under most exceptional conditions, by years of waiting and working. The temptation to secure work by the suicidal policy of cutting fees, or to increase the income by means of illicit commissions, of which we hear so much just now, would be done away under a statute which would render unprofessional conduct punishable by striking the offender off the roll, probably after a warning from the Central Council. Then, again, the architect would have the satisfaction of knowing that his scale of charges would be accepted without question of custom or precedent, his expert evidence in a court of law would, of necessity, have a far greater weight than is at present the case, while the public recognition of his status would bring about that *esprit de corps* which is now so sadly lacking in the profession—none would be below a fixed standard of education, consequently all would be able to meet upon the level with a degree of confidence in each other which is now necessarily conspicuous by its absence.

One great point in favour of legal registration is that it would put a stop to that overcrowding of the profession caused by the influx of incompetent and unqualified persons, who, although possessed of no previous training or sense of the fitness of things, obtain a share of work which should rightly go to the trained practitioner.

With regard to the disadvantages of registration, we cannot conceive of anyone who has given the matter reasonable thought seriously bringing forward objections to placing the profession of architecture at least on a level with the other closed professions, and we would undertake to say that there is no argument against registration which cannot easily be refuted.

As has already been noticed in your columns, the state of Illinois and the provinces of Quebec and Ontario have already sought and obtained legislation closing the profession to incompetence in those parts; though, while we are a long way behind Canada and the States in this respect, it must not be supposed that nothing has been done to remedy the existing state of affairs.

Some fourteen years ago the Society of Architects was instrumental in framing and introducing into Parliament a Bill for the Registration of architects, which has passed its first reading, and although much opposition has been and is offered to the measure, owing apparently to a strange misconception as to the likely result of registration in quarters where one would naturally look for initiative and support, yet the Bill will most certainly eventually become law. The Society of Architects—who, as a legally incorporate body of recognised standing, does uphold the principle of registration—will, in the interest of its members and of the whole body of the profession, support the Bill by every means in its power.

There are many points we have necessarily left untouched, but space is limited, though we hope to be allowed further opportunities of referring to the subject.

In opening your columns to a correspondence

on this important matter, you are taking the lead in a movement which is likely to be brought prominently before the profession and the public in the near future.—Yours faithfully,  
C. McARTHUR BUTLER.  
Secretary, the Society of Architects.

## Keystones.

The University College Technical School, Cardiff, is in need of enlargement, partly owing to accommodation being required for the plastering class.

The Statue of the Queen, by W. H. Thornycroft, R.A., erected by the Corporation of Durban to commemorate the Diamond Jubilee was unveiled on April 19th.

A new Church at Cardiff is being erected near the south-eastern entrance to Roath Park. It will involve an outlay of about £10,000. Mr. Edgar Fawcner is the architect.

The New Aberdeen Parish Council Offices have just been occupied by the officials. Mr. A. Marshall Mackenzie, A.R.S.A., is the architect. The cost has been about £8,000.

The New Private Lunatic Asylum for the West Riding is now being erected by the County Council at Scalebor park, at a cost of £115,000, and will give accommodation for 210 patients.

A New Public Hall at Kirkpatrick-Fleming has been erected by the villagers, in commemoration of the diamond Jubilee of her Majesty. It has cost £750, £300 of which has as yet been raised.

Aberdeen Fish Market is considered in need of extension, and the Town Council and Harbour Board have been asked to spend £3,760 on the strengthening of the wharf to bear the extra weight.

A new Fire Brigade Station which has been erected at Paisley, at a cost of between £7,000 and £8,000, was opened on the 13th inst. Mr. Moncur is the architect, and has been assisted by Mr. Rowe.

Dangerous Structures.—The inspectors of dangerous structures report that two chimney stacks at 95, Fleet Street, E.C., are dangerous, and that the parapet of the party wall between 93 and 94, Fleet Street is in a similar condition.

Church Restoration at Surfleet.—A fund is being raised for restoring the parish church at Surfleet, near Spalding. The total amount required is £2,000. When £500 is raised it is proposed to proceed with the restoration of the nave.

A large Stained Glass Window has been unveiled in St. Kerverne Church in commemoration of the wreck of the "Mohegan," and it is proposed to erect a Cornish cross over the graves where so many of the passengers and crew were buried.

Mr. Henry L. Florence, Vice-President R.I.B.A., the present Grand Superintendent of Works has been re-appointed to that office in Grand Lodge for the ensuing year, by the Most Worshipful Grand Master, H.R.H. the Prince of Wales.

A new Deep Water Dock at Seaham Harbour has been started. Messrs. Pearson, of Westminster, are the contractors for the building of the dock and piers, which will be formed of concrete blocks, weighing thirty tons each, faced with granite. The operations are expected to take about four years to complete.

Woolliscroft's Brick Paving.—In our issue of April 19th there appeared a notice of Messrs. Woolliscroft's system of brick paving, in which it was stated that a part of the roadway of High Street, Islington, has been laid with these bricks. Lest visitors to the Building Trades Exhibition should waste time in searching for this brick paving, it may be well to state that the above indication of the locality was not quite accurate. The brick paving in question is laid in Upper Street, Islington, about a hundred yards from the Agricultural Hall, going towards Highbury.

## Masters and Men.

**The Johnstone Builders' Labourers** have struck work for an advance from 5½d. to 6d. per hour.

**The Huddersfield Joiners** struck on April 29th for an increase of wages from 7½d. to 8½d. per hour.

**The Labourers at Stirling**, in the employ of the masons and kindred firms, have struck for an increase of ½d. per hour on their present wage of 5½d.

**The Bothwell Quarrymen** were granted, on May 1st, an advance of ½d. per hour, making the wage now 7½d. per hour, and the cranemen an advance of 2s. per week, making 30s. per week.

**The Leicester Builders' Labourers** are on strike for an advance of ½d. per hour on their present wage. The Midland Federation of Builders threaten to stop all labourers within their area; 728 men are receiving strike pay.

**The Felixstowe Bricklayers** recently struck work for an increase of 1d. per hour on their present wage of 7d. The masters offered ½d. rise, but this was refused. Very few of the men have remained in the town, as plenty of work was found elsewhere.

**The Operative Masons of Perth** some time ago made application to the masters for an increase of ½d. per hour on their present wages of 8½d. and 9½d. per hour. The employers have declined to accede the demand and a strike is very probable.

**The Sheffield Carpenters and Joiners** and the local Master Builders' Association had a conference recently, when it was decided that the men should have their request granted for an advance of ½d. per hour on their present rate of wages, to commence from May 1st.

**The Sunderland Bricklayers' Labourers**, having struck for an advance of ½d. upon their wage of 6½d. per hour, have caused the Masters to lock out the whole of the trade to the number of over 400, and they have given notice that they intend to reduce the labourers' wages to 6d. per hour.

**The Dispute at West Hartlepool** led to a serious outrage on April 24th. A builder's labourer, named Jordan, working on a house in course of erection, was followed by two other labourers, with whom he had some words. The pair seized Jordan, and, it is alleged, threw him to the ground, breaking his leg, and causing him other serious injuries. The assailants are in custody.

**The Bradford Corporation** have offered to the employees of the Streets and Drainage Committee a revised scale of wages on the basis of limiting the hours to 49½ per week, with overtime at the rate of time and a quarter, and Sunday work at the rate of time and a half. The men's leaders have declined to accept the scale, asking for a larger increase; the Streets and Drainage Committee have reaffirmed their previous decision.

**The Edinburgh and Leith Joiners** state that there are between sixty and seventy men working in Edinburgh and Leith, and that since the strike began 150 men have been sent to jobs outside the city. A meeting of the Committee of the Master Joiners took place on April 24th, when a reporter was informed that the meeting was of opinion that no circumstances had yet arisen to necessitate the calling of a general meeting of the masters. They desired it to be stated that there were from 300 to 400 men working at present in Edinburgh and Leith, and that the workmen were going back to their work at the old rate of wages.

## THE DISPUTE IN THE BUILDING TRADE.

**T**WO thousand members of the Italian Colony attended a meeting in Hyde Park on April 23rd, to protest against the circumstances in which Italian labour is being introduced into London in connection with the Plasterers' strike. It is said that 250 men have already been brought over, and that more are coming. The Italians state that they are on the best of terms with the British workman, they sympathise with the strike, and they are ready to join their trade unions. It is alleged that the Italian plasterers who have been brought over were not informed of the real state of affairs. The Italians were promised their fares to London, a minimum of two months' work, employment for an indefinite period if they proved good craftsmen, and an indemnity of £20 apiece if for any reason work could not be provided. The meeting at Hyde Park passed a long resolution, a copy of which was at once left at the Italian Embassy by a deputation, calling on the ambassador and the press to take action to make the true facts of the case known in Italy and this country. Mr. T. Costigan, secretary of the London Master Builders' Association, states that the Association's agents clearly informed these workmen that a trade dispute existed in London in consequence of the unreasonable demands of the London plasterers, although it was possible that, out of the hundreds of men engaged, a few might be found to state the contrary. The immediate object of the engagement of Continental plasterers was to fill the places of workmen who persisted in practices which, apparently every one, except themselves, regarded as not only objectionable, but indefensible. The services of Continental plasterers would, he stated, obviously be required for a long time, until the increased supply of apprentices had become duly qualified mechanics. Mr. Costigan adds that his association is paying these Continental workmen the full London rate of wages, which is about double the rate they can earn in their native country.

At Newport, the men employed by Mr. Dyson Parfitt, the secretary of the Newport Master Builders' Association, struck work on April 24, owing to his having imported three plasterers to take the place of his men on strike. Mr. Parfitt has had the secretary of the Newport Building Industries' Federation put on trial for alleged intimidation of and incitation of men against these three plasterers, and it is expected that the whole trade in Newport will be locked out by the masters this week.

The Bradford Amalgamated Builders' Federation passed a resolution of April 26, condemning the action of the master builders in reference to the proposed general lock-out, which was described as "contrary to all rules agreed upon between employers and men; six months' notice being required by either side before any such action is taken." It was further resolved to earnestly appeal to societies outside the building trade to support the operatives, both morally and financially; and that in the event of the master builders locking out the whole of the men in the building trade, the Bradford Federation at once offer to receive work from any proprietor.

A lock-out in Swansea is probable, for three months ago the plasterers and joiners tendered notices to cease work unless they received an advance on present wage rates. This notice terminated last Saturday. An effort has been made to bring the matters in dispute to a settlement, but up to now this has failed. It appears that masons, joiners, and plasterers at Swansea have been paid the same wage rate. In June last the masons obtained an advance of ½d. per hour, and now the joiners are asking for the additional ½d., whilst the plasterers have put forward a claim for an additional 1d. per hour. The joiners have been offered an increase of ½d. per hour. This has not been accepted. It is said that some

150 plasterers and 200 joiners are affected, and there is a remote possibility of the masons and others being locked out.

The quarterly meeting of the National Association of Master Builders of Great Britain and Ireland took place at Birmingham on April 27th, Alderman Houldsworth (Bradford) in the chair. The request in a letter from the Scottish Building Trades Federation asking to become affiliated with the Association was unanimously agreed to. The report of the deputation appointed to meet the operatives in conference was then received, and it was decided to form a Builders' Foremen's Society for the whole of the allied building trades. The chief business for consideration was the plasterers' lock-out, and the question was whether a general stoppage of all the other branches of the building trades should be ordered. This step will affect 300,000 men. Among the items on the agenda paper was a motion authorising a general meeting of the association to be summoned for the purpose of making a levy and, if necessary, of defining the procedure in connection with the plasterers' dispute. The only information that was supplied to the Press was the following resolution, which, it was said, had been unanimously passed:—"That this meeting recommends the National Association to ask the whole of the building trades' operatives' unions for a definite assurance that they have no sympathy with and will not support in any way the National Association of Plasterers in the present dispute, and that if such an assurance is not forthcoming from all of them by May 6th, the question and terms of a general lock-out shall be settled at a meeting of this council." The approximate number of members of the National Association of Plasterers was stated to be 10,558, and the number locked-out 4116.

A vote has been taken by the members of the Northern Counties Federation of Builders upon two propositions—first, whether there shall be a general lock-out of all branches of workmen in the building trades in the federation unless the plasterers' dispute is settled forthwith; and, secondly, whether there shall be in the Northern Counties a general lock-out of labourers in the employment of members of the federation in case the disputes at Sunderland, Gateshead, and Middlesbrough are not settled. The returns are not yet complete, but it is understood that a majority in favour of both propositions is assured.

The Yorkshire Federation of Building Trade Employers, at their meeting on April 28th, instructed the Hull master builders to lock out 25 per cent. of their men. In the event of the dispute not being settled by May 5th, it was further resolved to give instructions to the whole of the members of the Yorkshire Federation to immediately lock out 25 per cent. of the operatives in their employ. This will not only at once affect Yorkshire, but it is extremely likely that it will precipitate matters in the country generally, more particularly in the north. At the Birmingham meeting on Thursday the representatives from the Northern and Lancashire and Cheshire centres favoured a much stronger resolution than the one actually adopted. The Yorkshire Federation will now seek the support of all the federated districts, and will enforce their resolution, independently of any action on the part of the Executive of the National Association in regard to the general dispute. The cause of this latest ultimatum was that a section of the union bricklayers in Hull refused to work with non-unionist plasterers.

It is stated that the plasterers' strike in Birmingham is at an end, and that the whole of the 178 men who were originally locked out have returned to work. In several instances it is stated by the men that architects had made requests to the operatives' association that men should be allowed to work for them instead of for the builders, and this was permitted, though it was asserted that the master builders were cognisant of and connived at what was done. As a consequence some of the employers had sent for their plasterers back again, and had severed their connection with the employers' organisation.

## Professional Practice.

**Aberdeen.**—The Aberdeen School Board are erecting several new schools in the town. The new Kittybrewster School, to accommodate 1,112 pupils, is almost completed, internally and externally, and operations are now in progress for the laying-out of the playground. The Board has introduced its own system of heating and ventilation—a modification of the Key system—into this school. The modification consists mainly in that, whereas under the Key system the air is heated by passing through one large coil in the main duct, under the modified system the heating area is increased by introducing coils into the branch ducts as well.—The Old Aberdeen School, of 562 places, has the mason work finished, and the plumber and slater works are well advanced. It is expected that it will be opened in December.—The new Hanover Street School is being erected partly on the site of the old school and partly on adjoining land, and is designed to accommodate 985 pupils. The old buildings having been demolished, the masons have completed the walls up to the level of the top of the first floor, and the beams and joists of the ground and first floors are being laid.—The tenders for the new Mile End School have just been decided upon, and the following contractors have been accepted:—Mason work, James Gauld, Gilcomston Park; carpenter, Alexander Hall, Mile End; slater, Adam and Co., Hutcheon Street; plasterer, Stephen and Gibb, Hutcheon Street; plumber, James F. Anderson, Bath Street; painter, Mason and Son, Queen Street; steel and ironwork, George Bisset. The total amount of the contract price is practically £12,000. The new school, which will accommodate about 1,150 pupils, is to be erected on the vacant piece of ground bounded by Gordondale Road on the west, Mid-Stocket Road on the north, and Beechgrove Place on the south. The school will stand practically in the middle of the ground, running north and south, with the main front towards Gordondale Road—in which will be placed the main entrance to the ground. It will be a three-storey building, built of grey granite, the ordinary walls being of Rubislaw, and the more decorative features of dressed Kemnay granite. The main front of the school—facing westwards—is marked by two projecting gable-forms, one at either end, that rise to the full height of the building, each finished in the form of an effective pediment, pierced by a decorative circular window. The front wall between these gable-forms is slightly recessed. The boys' entrance will be placed at the north end, and the girls' entrance at the south end. The chief architectural features in the building, apart from the gable forms in the main front, are to be seen in the decorative heads of the windows, the moulded string courses that run along the building above the ground floor and first story, and the series of pilasters that run round the west, north, and south fronts on the second story. Surmounting all will be an elaborate overhanging cornice in Dantzic redwood. The front and back portions of the building, internally, will be divided by a wide longitudinal corridor, to which access will be gained by the main doorways at either end, and in which will be situated the main staircase leading up to the first and second floors. The accommodation on the ground floor will consist of head teachers' rooms at either end of the main corridor; along the west side of the corridor four class-rooms for infants; and along the east side of the corridor a large gymnasium. On the first floor will be assistant teachers' rooms, and eight more class-rooms; on the upper floor a music room, a manual instruction room, a science room, and a cookery room, with five class-rooms for advanced pupils. A janitor's lodge is to be provided within the enclosing wall at the south-west corner of the ground. The architect for the new school is Mr. A. H. L. Mackinnon, Union Street.—The Board have also in hand various minor building schemes. A new gymnasium and cookery and

manual instruction room in connection with the King Street School have just been opened, and have cost between £1,600 and £1,800. These building schemes of the Aberdeen School Board will cost between £50,000 and £60,000, in addition to the £17,000 for the Central School scheme, at present in abeyance.

**Hexham.**—At their annual meeting on April 18th the Hexham Board of Guardians approved of the plans for the new vagrant wards to the workhouse, submitted under the *nom de plume* of "Arcadia," the author of these being Mr. T. Leslie Anderson, M.S.A., of 4, Royal Arcade, Newcastle-on-Tyne. It was decided that the premium of £20 should be held over until after the Local Government Board had approved of the plans, and a contractor was found willing to carry out the work for the amount of the architect's estimate, £2,000.

**Perth.**—New offices are in course of erection on the site of the old Post Office, Perth, for the General Accident Assurance Corporation, Limited. The old Post Office has been entirely demolished, and the contractors are now proceeding with the erection of the structure. Owing to the uncertainty of a solid foundation, it has been found necessary to excavate over the whole area to a considerable depth. In the course of these operations the workmen came across what are supposed to be the abutments of the old bridge of Perth. Advantage has been taken of the excavations to form a basement floor, which will be set apart for fireproof safes, store rooms, boiler, engine, and dynamo rooms. The ground floor will be almost entirely taken up by a large counting room having accommodation for seventy-seven clerks, while a portion will be devoted to the counter and space for the public. On this floor are also the assistant manager's room, rooms for the heads of departments, telephone room, waiting and cloak rooms, and lavatories. On the entresole floor, between the ground and first floor, are the lady typewriters' rooms and retiring rooms. The first floor contains a second large apartment, with accommodation for thirty-six clerks. There are also situated here rooms for heads of departments, a large Board room and ante-room, and the general manager's room, having private lobby and retiring apartments. On the second floor are extra clerks' rooms, keeper's house, clerks' luncheon room, kitchen, and other accommodation, while the attic floor contains extra storage accommodation. The principal elevations are to be built with yellow freestone from Woodburn Quarry, Cumberland, with polished granite doorways and red stone columns in the colonnade of the second floor. Internally the walls of the principal office will be lined with marble and finished in oak. The principal staircase will also be in marble and oak, while the Board rooms will be panelled in mahogany. The whole building will be of fireproof construction, will be heated with steam and thoroughly ventilated, and the artificial lighting will be by means of electric light. The work is being carried out under the direction of Mr. G. P. K. Young, A.R.I.B.A., while the contracts, so far as settled, have been entrusted to the following tradesmen:—Mason work, Messrs. R. Brand and Sons; joiner work, Messrs. James Hay and Sons; plumber work, Mr. James MacLeish; plaster work, Mr. Alexander M'Ritchie, Dundee; slater work, Mr. James Buchan, Perth; glazier work, Messrs. G. R. Douglass and Son; iron work, Messrs. Mather and Son, Edinburgh.

**Woodford (Essex).**—The Woodford School Board have had a scheme for the erection of new schools in the George Lane district under consideration for some time, and plans have been prepared for a school for 750 children together with accommodation for a cookery centre. At a recent meeting of the Board it was decided to proceed at once with a block to accommodate 488 children and the cookery class room. The plans for this block have been approved by the Education Department and tenders will shortly be invited. The Architect is Mr. E. Tidman, C.E., F.S.I., Victoria Street, Westminster.

## Under Discussion.

### BRITISH ARCHÆOLOGICAL ASSOCIATION.

The tenth meeting of the Session was held on the 19th inst.—Mr. Bloshill, hon. treasurer in the chair. The hon. secretary, Mr. Patricks, announced that the Congress would be held at Buxton, from July 17th till the 22nd. Mr. Dack, of Peterborough, then read a paper on "Old Peterborough Customs and their Survival." The Rev. H. J. D. Abtley, hon. secretary, read a paper by Miss Russell, on "Some Recent Observations on the Vitrified Forts and Drystone Brochs in the North of Scotland and elsewhere." The paper elicited considerable discussion, the chairman remarking that it was not the first time that the subject of vitrified forts had been brought before the association, but more evidence of the vitrification was required. Mr. Gould remarked that these forts were not necessarily to be taken as early work; in several instances pieces of Roman tile had been found in their construction.

### ARCHITECTS AND SECRET COMMISSIONS.

At a special meeting of the Council of the Glasgow Institute of Architects, held on April 24th, Mr. David Barclay, F.R.I.B.A., president, who was in the chair, explained that the meeting had been called to consider the principle of the Bill, recently introduced into the House of Lords by Lord Russell of Killowen, relating to illicit commissions. The President stated that one of the objects of the Institute is to insure that the business carried on by its members would be free from anything dishonourable, and that they welcomed any action, through such a Bill or by any other means, which would insure fair trading in business and honourable dealing amongst all professional men. By Article 10 of the Articles of Association of this Institute every member is required, as soon as possible after his election, to sign a declaration that he will not have any interest in any trade contract for work which it is his duty to superintend or pass; nor will he receive or accept any pecuniary consideration or emolument from any measurer or tradesman working for a client under his supervision; but shall in every case receive payment for all professional services from his client direct, and not otherwise. It would seem, however, from the comments on Lord Russell's Bill which have appeared in some of the public prints, that this is not fully understood, and that architects, along with others, are assumed to be commonly in receipt of such double commissions. He believed that the profession in Scotland was singularly free from this taint. The following resolution was then unanimously passed:—"That the Council of the Glasgow Institute of Architects, in the interests of honest trade, and to show its disapproval of illicit commissions, in whatever form, resolves to support the principle of Lord Russell's Bill, and that this resolution be communicated to the Royal Institute of British Architects, and that this Council expresses its willingness to support that body in any similar action it may take in favour of the principle of the Bill."

### DISCOVERIES AT GLASGOW CATHEDRAL.

At the monthly meeting of the Glasgow Archaeological Society on April 20th, Mr. P. Macgregor Chalmers read a paper on "The Early Fabric of the Cathedral, with notes on the recent excavations." A short historical sketch of the early structures was given, bringing out prominently the probable relationship of each to the site of St. Mungo's altar, in the saint's own church. Under this altar, doubtless, the saint was buried. The site may be recognised to-day in St. Mungo's shrine. The church—the choir only—founded by Prince David, was in the Norman style, of the type of Dunfermline Abbey, or of much of the work of Durham. This choir must have been

destroyed at an early date, since there is evidence that a second choir was erected in the time of Bishop Ingelram (1164-1174). Of this fabric an interesting fragment remains in the old wa'l shaft in the lower church, marking, doubtless, one of the angles of the apse of this early south aisle. To this choir Bishop Joceline began to add a nave. Wynton says he enlarged the church in 1181. As the choir was again destroyed, this work was interrupted. Of Bishop Joceline's restoration a great deal more remains than is currently supposed. The north wall of the north aisle, the lower part of the north and south transepts, the general arrangement of the present vaulted landings leading to the aisles of the upper church, and almost the entire south aisle of the lower church, with its walls and vaulting, are of this period. The object of the recent search under the floor of the Cathedral, which was undertaken by permission granted by the Government, was to determine if any part of the ancient foundations had been allowed to remain. As a preliminary to this description, Mr. Chalmers indicated the results of a similar search at Jedburgh Abbey, carried out by him some time ago. At Glasgow the search went to prove that all the old foundations had been removed. It was doubtless found necessary to do this owing to the method adopted for the foundation of the present cathedral. It was found that the pillars are not carried down below the pavement level as pillars. A great wall, about 8ft. thick, seems to run continuously the whole length of the choir from east to west. It goes down a great depth, and reaches at the top to within 9in. of the floor. The four pillars of the shrine are also founded upon a four-square wall. One of the other interesting discoveries was the finding of two of the original glazed red brick floor tiles. These were exhibited at the meeting, and were compared with almost identical tiles found at Glenluce Abbey, which Mr. Chalmers is at present engaged in repairing. A series of interesting photographs were shown. These included one of the painted panels on the vaulting of the church. This contained four of the Ten Commandments. The last photographs shown were several of the remarkably beautiful carved bosses in the lower church, each carved with a beautiful face, undoubtedly portraits. The identification of the persons represented was to a large extent free from difficulty. One is a portrait of Bishop William de Bondington, who built this part of the church; another is a portrait of King Alexander II., who died in 1249. The other two portraits—those of a man and a woman—may be identified as Isabella de Vallonüs, lady of Kilbride, and Sir David Comyn, her husband. These carvings are unique in the Cathedral. They can hardly be considered in any other light than as a record in stone of a great benefaction. Mr. Chalmers referred to other such records in the Cathedral. Isabella de Vallonüs granted her "whole land, which is called the forest of Dalkam," to the Bishop and Church of Glasgow before 1250. The charter was confirmed by John de Balliol on September 14th, 1250.

**The Public Health Acts Amendment Bill** was read a second time in the House of Commons last Wednesday, and was referred to a select committee.

**A Shelter and Hospital** for the reception and isolation of poor patients suffering from infectious disease is to be erected on the site of the City Mortuary in Golden Lane, London. The superficial area of the new premises will be 2941ft. and the premises will consist of four storeys, the general management rooms and caretaker's apartments being on the ground floor. On the first floor will be the rooms for the patients suffering from disease. On the second floor will be the dormitory accommodation or shelter for families displaced by the outbreak of infection under circumstances which render the removal of the patient himself impossible. Ten beds will be provided for each sex. The third floor is to be held in reserve for further hospital accommodation.

## New Companies.

### Arvon Brick and Tile Company, Limited.

This company was registered on April 20th with a capital of £16,000 in £1 shares, to acquire, take over as a going concern, and carry on the business of brick, tile, and terracotta manufacturers and merchants, brick-earth, slate, clay, and building material merchants, builders, contractors, &c., now carried on at Carnarvon under the styles of "The Pebllick Brick Co." and "The Seiont Brick Company," and to enter into an agreement with U. Bromley, E. Pierce, and R. Evans. Registered without Articles of Association.

### Bagworth Brick Company, Limited.

This company was registered on April 19th with a capital of £10,000 in £1 shares, to lease from the Countess of Warwick certain lands at Bagworth, Leicestershire, and to carry on the business of brick, tile, terracotta, and earthenware manufacturers, clay and brick-earth merchants, coal and coke merchants, builders, contractors, &c. The number of the directors is not to be less than three nor more than five. The first are: H. Simpson Gee, John Roberts, and John F. Neal. Qualification, £100; remuneration, £100 each per annum.

### Carnells, Limited.

This company was registered on April 15th, with a capital of £10,000 in £1 shares (of which 4000 are Preference), to acquire and take over, as a going concern, the business now carried on as "Carnell and Co.," at Enfield, Middlesex, and to carry on the business of builders, contractors, decorators, brick and tile manufacturers, builders' merchants, etc. The number of the Directors is not to be less than two, nor more than five. The first are: H. K. Bridger, of 2, Danes' Inn, Strand, London, W.C.; A. Armfield, of 2, Central Buildings, Lancaster Road, Enfield, and H. W. Carnell, of Lavender Villa, Lavender Road, Enfield. Qualification £50. Remuneration, £300 per annum divided between them. Registered office: 5, Central Buildings, Lancaster Road, Enfield, N.

### Richard Bennett and Company, Limited.

This company was registered on April 18th with a capital of £12,000 in £10 shares, to acquire and take over as a going concern the business now carried on by William Sayer at Slack Lane and Thorncliff, Derby, under the style of "Richard Bennett and Co.," to enter into an agreement with the said vendor, and to carry on the business of brick, tile, pottery, and earthenware manufacturers, and merchants, builders' merchants, builders' contractors, decorators, &c. The number of the directors is not to be less than two nor more than five. The first are: Mrs. Elizabeth Bennett, of The Lindens, Utttoxeter New Road, Derby; William Sayer, engineer, of The Mount, Rowditch, Derby; and Richard C. S. Bennett, brickmaker, of The Lindens, Utttoxeter New Road, Derby. Qualification, £500. Registered office, Slack Lane, Derby.

### Wharfedale (Ilkley) Estate Company, Limited.

This company was registered on April 18th, with a capital of £55,000 in £10 shares, to enter into an agreement with Marmaduke F. Middelton, of Ripon, for the acquisition of certain lands on the north bank of the River Wharfe, near Ilkley, York, to enter into an agreement with Thomas Horsman, to develop, turn to account, and deal with such property, and to carry on the business of builders, contractors, decorators, stone merchants, brick, tile, and pipe makers, lime burners, &c. The first directors (to number not less than three nor more than seven) are: Henry Sutcliffe, Henry Ellis, Hugh O. Arnold Foster, M.P., Victor Edelstein, John K. Empsall, John T. Hemingway and John Illingworth. Qualification, £2,000. Remuneration, £350 per annum divisible. Registered office: 1, Piccadilly, Bradford.

### S X Brick and Cement Company, Limited.

# Moore's Patents Company Ltd.

Registered Offices: 73, DIGBETH, BIRMINGHAM.

THESE window patents cover the only complete and up-to-date windows on the market, and are now in use with the following advantages over the ordinary antiquated pocket frames or other costly and complicated sorts. Our frame, being of **Solid Material**, it is much more substantial and labour is saved, in sawing, planing, and a lot of carpenter's time putting it together.

The sashes are made in the usual way and are slung so that they are always bearing on the inner beading; consequently they cannot rattle.

While both sashes can be regulated in any position with the hand, a child can also regulate them in like manner with the sliding handles.

A self-fastener operates when the sashes are closed, making it impossible to open them from without, while it pulls the meeting rails tight together, and ensures them being locked.

These sashes can also be regulated when high up by bringing the end of the cord down, or at a distance, by carrying it to any part of the compartment or building.

By stitching the end of a new cord to the old, and pulling the latter out by the other end, it is replaced in a minute by the new. Should it at any time break, the sashes are secured against falling, and a domestic can lace in a new cord in a few minutes, avoiding the unpleasantness and expense of bringing strange workmen into the house.

Simply and only by lowering both sashes to the bottom and turning in the hinged beading and withdrawing the parting bead, these sashes can be turned inward like a door on their hinges, for cleaning, &c., during which time they cannot lift off only when desired. This will prevent hundreds of accidents and save heavy damages under the Employers' Liability Act.

These windows are warranted watertight, and, as it is impossible to open them from without unless a smash is made, and being without doubt the most simple, cheap and efficient yet introduced, they are wanted everywhere, and on this account this Company can only take orders to execute them in rotation and as soon as the additional machinery is completed for turning out very large quantities.

Moore's Patent Faught Opener beats all records for cheapness and simplicity, as one cord operates it without cog or screw-gear.

Moore's Patent Door Spring does not require oiling. It is so simple it can be put on a door in a few minutes. While it closes the door gently, it will hold it open. It costs very little, and cannot get out of order.

## COMPETITIONS.

### PLUMSTEAD VESTRY. TO ARCHITECTS.

PROPOSED MUNICIPAL BUILDINGS AND PUBLIC LIBRARY AT GOSSAGE ROAD, PLUMSTEAD.

The Vestry of the Parish of Plumstead invite Architects to submit DESIGNS for their proposed new MUNICIPAL BUILDINGS and PUBLIC LIBRARY, which must be delivered to the Vestry Clerk at the Vestry Hall, Maxey-road, Plumstead, not later than NOON on JULY 27th, 1899.

The contemplated expenditure is £40,000, and premiums of £100, £75, and £50 will be paid to the authors of the Designs placed first, second, and third respectively by Mr. EDWARD W. MOUNTFORD, F.R.I.B.A., the Assessor appointed by the Vestry, whose decision shall be final.

Plans of the site and particulars of required accommodation, and instructions and conditions of competitions, may be obtained on and after APRIL 27th, 1899, on application to me at the Vestry Hall, Plumstead.

By order,

EDWIN HUGHES,

Vestry Hall,

Maxey-road,

Plumstead,

April 25th, 1899.

## THE BUILDING TRADES' EXHIBITION.

A SECOND survey of the Exhibition at the Agricultural Hall amply confirms the opinion we expressed last week that this is the largest and most comprehensive exhibition of the kind that has yet been held. There is scarcely any one of the numerous industries involved in building that is not fairly represented. In the matter of arrangement a great improvement has been made as compared with the exhibitions of previous years; the grouping together of exhibits of the same character—electrical, smoke-abatement, road-making and so on—is convenient for purposes of comparison as well as in other ways. During the past week visits have been paid to the exhibition by the Institute of Builders, the Association of Municipal and County Engineers' and the Surveyors' Institution. To-day the Clay-workers' Institute are holding their annual meeting and dinner at the Agricultural Hall, and to-morrow the Society of Architects will pay an official visit. We resume this week our detailed examination of the exhibits. In order that we may deal more or less adequately with the large number of stands that are worthy of notice, this week's number is enlarged by the addition of four extra pages.

### THE OPENING CEREMONY.\*

The Exhibition was formally opened at noon on Wednesday by Professor G. Aitchison, R.A. After making a tour of the building, in company with a number of other distinguished visitors, and examining many of the more notable exhibits, Professor Aitchison presided over a small meeting held in the gallery, and delivered a very interesting address, which, however, owing to the noisy efforts of workmen and others engaged in putting the finishing touches to the stands, was, unfortunately, inaudible to a large section of the audience. Professor Aitchison began by referring to the importance of the industries represented at the Exhibition. He pointed out that no building of brick, stone, or concrete could be erected without lime or cement, at least in this country, though we read of Babylon being built of bricks and asphalt. The inventor of mortar was not known, but it was known that the pyramids of Gizeh were put together with it. It was to the necessity for limestone and fuel that were due the destruction of so many temples and other grand classical monuments.

### The Uses of the Exhibition.

Viollet le Duc gave a long list of all the trades involved in building. They had come to this Exhibition to see new inventions and new applications of machinery to the builder's craft. The show was more or less useful to everyone, but was particularly so to the architect. The application of machinery to all sorts of productions had been of immense advantage to those engaged in building. As an example of the usefulness of this application of machinery, Professor Aitchison mentioned that on one occasion he wanted to use some square moulded balusters, but the expense of working these by hand was too great to allow of their use being thought of. He found, however, at a previous Building Trades' Exhibition, an exhibit that had been worked by machinery, and this enabled him to adopt the style of balusters desired.

### Steam and Electricity.

One of the ancient Roman poets spoke of "dreadful war yoking the red dragons to her iron car," but the elemental dragons, said the Professor, had been yoked by the moderns to the golden car of peace. The ancients had used the fall of water and the force of wind

for mills and ships, but just before our time the application of steam had increased our power of production at least a hundred fold, while the advances of electrical science—which were well demonstrated in this exhibition—opened a vista which was amazing to contemplate.

### High Wages and Bad Workmanship.

One of the great revolutions of recent times had been the increased wages of the working classes; but, like other revolutions, this had not been wholly advantageous, for it had been the means of encouraging the manufacture of rubbish. Up to a comparatively late period England was celebrated for the excellence of her workmanship; English cabinet work was known abroad for the excellence of its wood and fitting; and English firms, he hoped, were still celebrated for the excellence and durability of their machinery; but in some classes of manufacture it had become almost impossible to get anything really good. There was an insane desire to have things cheap, without regard to their excellence and durability, or even their temporary utility. The bulk of English cabinet work was very different from what it once was; small fastenings having the appearance of solid brass would bend in the fingers as if they were lead, while sash-lines and chair bands were made of stuff scarcely more durable than tinder.

### An Exception.

In certain trades there was a counterpoise to this passion for rubbish; in all kinds of sanitary appliances perfection of workmanship was one of the necessities. This was an immense advantage to the workman and manufacturer; it taught them to be thorough, careful, and accurate, and not to scamp their work, for the tests which sanitary experts had learned to apply, instantly discovered imperfect work or materials.

### Colour in Building.

Professor Aitchison then turned to a consideration of the question of introducing colour in building work. Twenty or thirty years ago, he said, he had pointed out the enormous advantage it would be in manufacturing towns to have the whole outer faces of buildings covered with enamelled bricks, or enamelled terra-cotta. This was sometimes done with white or pale coloured bricks in cases where the light for the fabric itself or neighbouring buildings had to be considered, but the appearance of such buildings was rather more hideous than if they had been built of ordinary brick. There were ridiculously few buildings of enamelled brick-work or earthenware where any attempt was made to give them beauty of form and colour. This was due to three causes: to the wretched leasehold system; to the time required, and the accidents both to shape and colour of fine earthenware, inherent in the potter's trade; and to the desire of people to get artistic design for nothing.

### The Use of Glazed Surfaces.

As to the advantages of the kind of building he advocated, Professor Aitchison pointed out that dirt and soot do not cling so much to a polished as to a rough and porous surface, and that which does stick is easily washed off. But what he chiefly insisted on was the great importance to mankind of beauty, both in form and colour. The works of Nature were all more or less beautiful, and those beauties were surely intended for man's purification, solace, and delight. In great towns, therefore, where Nature's beauties were shut out and where the sky was obscured by smoke and dust, there must be a lowering of man's intellectual and moral powers, unless those gifted men who could impart beauty were employed to confer those beauties they had culled from Nature on the habitations and the utensils of townspeople. The Professor quoted Charles Garnier's description of what he hoped Paris might become, and concluded with the expression of a hope that this country might furnish to the whole world artistic productions that might vie with the works of Flaxman, if they did not equal the superhuman excellence of the Greeks.

A vote of thanks to Professor Aitchison was proposed by Mr. J. W. Swan, F.R.S., who

said that we in England suffered from our conservatism. We were a conservative people; that was a source of strength, but also of weakness. English people generally were too prone to adhere to old methods when new ones had been found which ought to supersede the old. Means were required, such as this exhibition afforded, for making known the improvements that had taken place in the building arts. The motion was seconded in a few sentences by Sir Arthur Blomfield, A.R.A., and heartily carried. Professor Aitchison's acknowledgement of the compliment concluded the proceedings.

### CROSSLEY BROS., LIMITED.

Messrs. Crossley Bros., Limited, of 10, St. Bride Street, are showing the following engines:—One eight manpower nominal horizontal gas engine, which is capable of giving a maximum effective horse-power of one and a half, at its normal speed of 270 revolutions per minute. One ten horse-power nominal horizontal gas engine, which is capable of giving a maximum effective horse-power of twenty-two, at its normal speed of 180 revolutions per minute. One two horse-power nominal horizontal oil engine, which is capable of giving a maximum effective horse-power of four and a quarter, at its nominal speed of 230 revolutions per minute. One four horse-power nominal high speed special electric light gas engine, with extra-heavy flywheel and extend bearing, capable of giving a maximum effective horse-power of 13·4 at its normal speed of 250 revolutions per minute. This engine is being employed to drive the electric lighting installation of the stand, which consists of six arc lamps and forty-eight sixteen candle-power incandescent lamps. All the above, except the oil engine, are shown in operation.

### THE EASILY CLEANED WINDOW COMPANY.

The E.C.W. sashes are on view at No. 106 Stand in Row F. The exhibitors claim that their method is the simplest and safest, as all sashes and fanlights can be cleaned from inside. The patent sashes, casements, and fanlights are adaptable to any window without alteration to the frames, and can be supplied ready to fit to new or old frames, solid or cased. The firm is willing to supply any architect with working drawings if he wish the builders to make the sashes, the fittings only being supplied by the E.C.W. Co.; and they specially invite architects and builders to inspect the patent at their stand, or at their offices at 15, Chester Street, Shrewsbury.

### EDWIN PALMER.

Palmer's Patent Wire-supported Travelling Cradle is now so well known that a notice of it is almost superfluous; but Mr. Palmer, of 250, Westminster Bridge Road, London, S.E., anxious that all the building public may become personally acquainted with its merits, exhibits a large size model of his "cradle" in full working trim. It needs but half an eye to see that it is destined, in course of time, to beat the old-fashioned cradle off the field, or, shall we say, the house front.

### SISSONS BROS. AND CO.

As we recently (in our issue for April 19th) drew attention to this firm's speciality—Hall's Sanitary Washable Distemper, it is superfluous to repeat here the particulars there given. It may suffice now to say that Messrs. Sissons Bros. and Co. show at their stand the varied applications of this material to all classes of work.

### W. G. AND L. ENGLAND.

It might with truth be said that of the inventing of different styles of reversible windows there is no end; and, carrying candour a point further, it might almost have been said that the reversible window, which had not some fatal defect or else required an apprenticeship in order to become acquainted with the vagaries of its working, still remained to be invented. Another point which has seriously hindered anything like a general

\* This report appeared in the Second Edition of our last week's number, published on Thursday last.

adoption of any style of reversible window, however desirable from every point of view such a general adoption might be, has been the question of costs. On account of the extra work involved, reversible windows must always be more expensive than windows not so fitted; but in the windows exhibited at their stand by Messrs. England, of Summer Lane Saw Mills, Barnsley (London representative, Mr. H. F. Pickering, 84, Melbourne Grove, East Dulwich, S.E.), the usual objections seem to be met in a simple and practical manner. Here we find an ordinary sash frame with sashes hung in the usual manner, excepting that the weights are attached to independent stiles to which the sashes proper are pivot hung at their exact centre. Both sashes and stiles are rebated so that when the reversing sashes are in their ordinary position, and a couple of flush bolts—one on either side at the head—in each are shot, draught proof sashes are secured that slide up and down in the ordinary way. In addition to the simplicity of construction and action and, of course, consequent thereon, we are informed that the cost very slightly exceeds that of ordinary sashes and frames. These windows should have a future before them.

#### THE ANDERSON PATENT PIPE COUPLING SYNDICATE.

This pipe coupling is designed to obviate the necessity of wiped solder joints, and is applicable to all kinds of block tin, lead, and lead to iron pipe connections. As applied to lead pipes, the ends are flared—a pair of special lead-pipe expanding pliers being employed—to fit the interior of the coupling (of brass); a special conical casting is then inserted between the two ends of the pipes and the coupling is tightly screwed up, making a joint which, it is claimed, is absolutely tight under any pressure. A further advantage is that the joint can be uncoupled and recoupled indefinitely without injury to the connection. Further particulars may be obtained from the Syndicate at Clun House, Surrey Street, London, W.C.

#### RIGBY, BATTCOCK, AND CO.

This exhibit comprises specimens of the various kinds of brushes and tools used in the painting and decorating trades; the quality of these goods Messrs. Rigby, Battcock and Co. (50, Bethnal Green Road, London, E.) claims to be "second to none." Specially noteworthy are their copper banded brushes and tools; and a description of their exhibit would scarcely be complete without reference to a couple of relics in the shape of stumps of what were once distemper brushes, the bristles showing remarkably even wearing properties, and still (so the firm claim) retaining their "spring."

#### JOSEPH WEDGWOOD AND SONS, LIMITED.

An elegant exhibit, in a special position, is that made by the above-named firm, of Etruria, Staffs., and Hutton Garden, E.C. (London agent, A. Richards). It shows in a pleasing and tasteful manner the application of glazed tiles to both internal and external decorative purposes. The interior of the building presents a complete scheme of decoration in the "Adams" style, entirely ceramic, treated in four tones of one colour, which at once convinces one that tile decoration can be made "restful enough for ordinary living rooms." With this is introduced with pleasing effect original Jasper plaques; these have subjects upon them modelled by such masters as Flaxman, Tassie, Hackwood, &c.; their beauty, therefore, needs no description. This style of decoration is particularly suitable for hall, smoking, or billiard rooms in private houses. On the exterior of the stand are seen examples of richly coloured schemes and bright warm tones, which lend themselves to the exterior decoration of public buildings (so desirable in this cold, grey climate), or the vestibules, saloons, and smoking rooms of hotels, theatres, &c. The oak mantel within the building has been specially made for this exhibit by the well-known firm (established over a century) of Messrs. Thomas Edwards

and Sons, Newcastle-under-Lyme, who have also furnished the room. The Jasper frieze in the overmantel is made from the original models of Flaxman, and represents the twelve dancing hours following the chariot of Aurora. The panel in the mantel is also from the original moulds, the subject being the nine muses. There are also a collection of vases, and specimens of all classes of tiles for walls, floors, &c.

#### ABRAHAM THOMAS COOPER.

Mr. A. T. Cooper, of 92, Moray Road, Finsbury Park, London, N., is at hand with his well-known suction and vacuum pump; his periodical seances with this appliance, in combination with the exhibit of relics comprising all manner of unconsidered trifles gleaned from the otherwise unfathomable fastnesses of choked sinks and drains, suggest latent possibilities in the shape of hidden treasures, when his pump, to which no obstruction seems sacred, once gets to work. Mr. Cooper also exhibits samples of Cooper and Bryant's patent "clinch" lock—"absolutely burglar proof." The advantages claimed for this lock over others are: (1) That, the bolt being constructed with an aperture at the end which slides over and clinches the catch firmly, the door is securely fastened, so as to prevent

trouble was experienced from crooked pieces or bad joints." This speaks volumes for the care which the firm takes in executing its orders.

#### THE PATENT VULCANITE ROOFING AND ASPHALTE CO., LIMITED.

Vulcanite roofing—flat roofs covered with vulcanite and converted into gardens and promenades—seems to be steadily growing into favour, if we may judge from the photographic views of completed jobs issued with the catalogue of the Patent Vulcanite Roofing and Asphalt Co., Limited, of Dace Road, Old Ford Road, London, E., and Belfast. Samples of this material, also of asphalt damp-course, and felts for general building purposes, are on view at their stand; and those interested should make a point of visiting it, or of writing to the company for a catalogue.

#### LOWE'S PATENT SANITARY PIPE JOINT SYNDICATE, LTD.

The joint supplied by this firm is claimed by the makers to be a perfect and reliable water-tight joint as soon as it is completed. The patent consists in the use of bitumen for the joint, doing away with a socket altogether.

SHOWING METHOD OF MAKING LOWE'S PATENT SANITARY PIPE JOINTS ON SURFACE OF GROUND BEFORE LAYING IN TRENCHES.

any person from prizing the door open from the outside, and (2) that the catch which fastens the large bolt also slides a shutter over the keyhole, thus preventing picking or tampering with from the outside.

#### JAMES STIFF AND SONS.

This Lambeth firm are exhibiting a splendid collection of architectural terra-cotta work. The first thing that meets the eye in looking at the stand, is a richly carved Corinthian capital in terra-cotta. This is in very high relief, and forms a splendid centre to an interesting exhibit. Various styles of terminals, trusses, cantalivers, medallions, pedestals, vases, &c., in buff and red, are being shown. Sanitary stone ware is a speciality of the firm, and many specimens of their work are to be seen at the stand. Messrs. Stiff and Sons had an extraordinary task to perform some time ago. An order was given them to supply and send out ready for placing about 30,000 cubic feet of terra-cotta, to be manufactured from drawings made some 7000 miles away. They successfully accomplished this feat; and the architect states that "each piece fitted exactly into the place intended for it, and no

The joint is made by smearing the ends which butt with clay in a plastic condition. A cast iron collar is then fitted over the joint, and the bitumen is poured through a hole in the top. This mixture flows round the pipe, filling up the space between it and the collar, and completes the operation. The firm are demonstrating at their stand the strength of the joint by means of air pressure. The accompanying illustration shows the method of making joints on surface of ground, before laying in trenches. The address of the syndicate is, 315, Dashwood House, New Broad Street, London, E.C.

#### ENGRAVED WOOD, LIMITED.

A good selection of artistic wood panels, pediments, brackets, mouldings, &c., for a variety of purposes, will be found at this exhibit. The elegantly designed panels turned out by this Liverpool firm are much cheaper than those done by hand, and being wood throughout, are not liable to the drawbacks that seem inseparable from composition panels. Special attention should be paid to the patent chamfered panels, of which some splendid patterns are shown.

AN OVERDOOR (6FT. BY 1FT. 9IN.). EXHIBITED BY THE WOOD CARVING COMPANY, LIMITED.

### THE WOOD-CARVING CO., LIMITED.

This stand is, perhaps, one of the most artistic in the Exhibition. The front is formed of a Saracenic finement, and is a splendid piece of work. The firm are making a great speciality of this kind of work, and also their carved wood over-doors, a number of which are shown on the stand. The one here illustrated is typical of what they produce. Specimens of hand-carved panels, pediments, spandrels, capitals, and brackets are being exhibited, and the workmanship in all cases is excellent. Examples of mouldings for dados, picture frames, cornices, &c., made by the firm, complete this very pretty exhibit. The address of the company is Windsor Street, Birmingham.

### THE SANITARY LEAD LINING AND PIPE BENDING CO., LIMITED.

The patent lead lined pipes and fittings introduced by this firm are an important innovation. The firm claim that owing to the precautions taken, it is impossible for the lead lining to collapse. These pipes can be cut with facility to any length required. The lining is non-corrosive, and the iron casing so protects the lead as to render perforation or indentation a matter of impossibility. The Sanitary Lead Lining and Pipe Bending Co., Limited, of Cremorne Wharf, Lots Road, London, S.W., state that the pipes have been subjected to severe heat tests, and boiling water has been passed through them without any injury to the lining. At the exhibition a very extensive display of the pipes is being made.

### EWART AND SON.

Messrs. Ewart and Son, of 350, Euston Road, London, N.W., have a very large exhibit, a special feature of which is the hydraulic ventilator. This is driven by means of a water jet, and costs about one halfpenny per hour to keep going. It seems to be perfectly noiseless. The "Pagoda" soil pipe, made in copper or zinc, is a new thing, and admirably serves the purpose for which it is intended. Messrs. Ewart have succeeded in producing a porcelain enamel which rivals iron in hardness. The bath on which it is used is called the "Ewart agate porcelain bath." Although the enamel is so hard, it expands with the metal it covers. The geysers and heat radiators supplied by this firm are too well known to need describing here, but mention must be made of the fact that the "Acme" geyser supplies boiling water in the remarkably short time of one minute.

### BROAD AND CO. LTD.

Messrs. Broad and Co. Limited, of Paddington, who were the pioneers in introducing white enamelled ware into general use for drainage appliances, exhibit an excellent assortment of interceptors, grease and gully traps, channel pipes and junctions, manhole covers, and sanitary specialities generally. Their impermeable pipes are of so excellent a quality as to render the water pressure test

superfluous, but this test is still applied by them to these particular pipes, as also to salt glazed ware. They make a strong point of the design and configuration of their traps, &c., ease of flow and accessibility being leading features. This firm also exhibits samples of various kinds of bricks, brick-making forming an important branch of their business; amongst the samples may be found an exceedingly useful wire cut engineering brick, now being made at their Southall Brickworks; this brick is peculiarly hard, and has a ring like true metal. Broad and Co.'s patent sink is a most useful improvement on the old pattern; and will doubtless be largely used.

### W. P. BONWICK.

Mr. W. P. Bonwick, of 40, Clinton Road, Bow, London, E., is the manufacturer of "The Flaming Kitchener Cheek," which is a patent fuel saver and a smoke consumer. This patent cheek is made of the best Stourbridge fireclay, and is perforated with holes. These holes lead into central passages having exit at the top, through which the flames are drawn from the hottest part of the fire. Combustion takes place, and very little smoke or soot passes into the flues. "The Flaming Fire Brick" also serves the same purpose. Mr. Bonwick is illustrating the value of his patent at his stand at the exhibition.

### J. MITCHELL AND CO.

This firm occupy a prominent position on the ground floor, and the special feature of their stand is the enamelled fireclay bath, which is convenient and at the same time attractive in appearance. An article in great demand is their syphon closet, which is made in one piece. The firm claim that it is impossible for the closet to empty itself and so unseal the trap. They are exhibiting a new range of urinals which do not need a sparge-pipe, as the flushing rim is in the ware. The patent inspection valve is a very useful arrangement, as it affords ready access to the clearing arm of the sewer gas interceptor. The address of the firm is Craven House, Drury Lane, London, W.C.

### J. C. BROADBENT AND CO.

Although the employment of silicate cotton—sometimes termed "slag wool," the material being a mineral fibre, somewhat resembling wadding or cotton wool, prepared from slag, the refuse from iron smelting furnaces—for fire-proofing and sound-proofing purposes is no new thing, the material has not, perhaps, so extended an application as it might have were it better known outside the building trades. Favourable notice must therefore be given to the exhibit of J. C. Broadbent and Co., of Redcar, Yorks, and 93, Basinghall Street, London, E.C., who show a large sectional model of a building in which silicate cotton is used in every possible direction where its application would be of advantage. This exhibit seemed to attract a good deal of attention from visitors at the Exhibition.

### THE MURAL DECORATIONS SYNDICATE, LIMITED.

The Mural Decorations Syndicate, Limited, of 50, Milton Street, London, E.C., have one of the most attractive stands at the exhibition. At each end of the stand is a room, the walls of which are built with their patent terra-cotta and wire lathing for fireproof partitions. A dome, also made with the terra-cotta and wire lathing partially covered with their patent fibrous plaster, is over the space between the two rooms. The dome is supported by four columns, the centres of which are covered with the terra-cotta and wire lathing and fibrous plaster. Panels and statues made from the patent plaster are on view, and are very beautiful. The advantages claimed for the mural decoration are that it is solid in relief, that it does not alter, cringe, crack, or move after being hung, and that its artistic beauty cannot fail to charm. The claims of the company seem to be in the main justified; of the artistic beauty of the exhibit there can be no doubt.

### ASPINALL'S, LIMITED.

This firm's ordinary enamel is too well known to need any describing, but "Wapicti" is a recent success. It is a washable distemper, and has the properties of a strong disinfectant and antiseptic agent. It dries with a dull, flat surface, producing an effect not unlike fresco-painting. There seems to be no limit to the number of colours to be obtained. "Wapicti" is manufactured expressly for stopping the suction of porous walls, &c., and is a superior and effectual priming for new woodwork, saving coats of much more expensive paint. It will not decompose, chip, crack, or peel off, as is the case with size. An article of this description has long been the want of the decorating trade. "O" enamel is a good article; it gives a brilliant gloss, works easily, and dries hard. It is intended to be used for inside work. For outside work the Indian enamel is especially suitable. Both of these enamels are made in various colours. Inside the stand a door is on view which has been painted with the "O" enamel. It has a good appearance, and the enamel has set very hard.

### THE EMDECA METAL DECORATION COMPANY.

The decoration manufactured by this firm is unique. It is made of thin, flexible, gauze zinc sheets, which can be cut with ordinary shears and bent round the sharpest angle without injury to the surface coating. It is as easy to fix as ordinary artistic wall coverings. Paste made of two parts of ordinary whiting, and one part of white lead, well ground and thoroughly mixed with ordinary varnish, is the adhesive used. This is applied with a trowel or mason's scraper to the back of the sheet in a thin and even layer. The sheets can be applied to wood as well as to plaster, but not to walls or ceilings newly rendered with Portland cement. There are a number of attractive designs being exhibited, which are sure to commend themselves to visitors. The firm can work from a new design if a

sufficient guarantee to warrant the extra expense of making it is ordered. The Emdeca Co's. Offices are at 97, Queen Victoria Street, London, E.C.

#### GEORGE SKEY AND CO., LIMITED.

Messrs. Skey and Company, Limited, of Wilneote Works, near Tamworth, are showing an excellent combined sink standard and waste. It is made in stone ware, white, buff, or brown glazed to match the sink. The most important advantage in connection with it, is that one side is entirely open and the trap or pipe is thus exposed, so that when it is necessary to remove or clean the trap or pipe, this can be done without any trouble. These sinks are supplied with either one standard or two standards. Skey's channel and gully trap is claimed to prevent the suction of sewer gas or bad smells into the house through the sink waste, and to be self-cleansing. A variety of other sanitary appliances can be seen at this stand, among which may be mentioned the firm's salt and brown glazed kitchen sinks, sink bends, stoneware sink traps, improved manhole "channel" traps, Trew's grease traps, white and buff glazed channels, channel curves, and Roger Field's sewer gas interceptor. The red and buff chimney pots shown are well shaped, as is also the firm's spiral vent, which, they informed our representative, has sold in thousands on the coast.

#### THE LIMNER ASPHALTE PAVING COMPANY, LIMITED.

The interior of this stand is made attractive with a number of photographs. On each side of the stand is a long table on which will be found specimens of the asphalt made by the firm. Their rock asphalt is principally from Ragusa, in Sicily, and from their own mines at Montrotier, Bassin de Seyssel. The article is quarried in the usual manner and brought to England in the natural state. Refined bitumen, Bridport grit, and asphalt powder are being shown in great variety. The address of the firm is 2, Moorgate Street, London, E.C.

#### THE FIREPROOF PARTITION SYNDICATE, LIMITED.

This exhibit takes the form of a small shed composed of the Cunnah-Wright patent dove-tailed corrugated iron sheets for partitions, walls, floors, &c. They are fire, sound, vermin, and damp proof, and can be rapidly erected. Sections of the Cunnah-Wright patent laths are also being shown. These are intended to supersede all wood laths; they are perfectly fireproof. The stand also includes specimen bricks painted with Blundell's petrifying liquid. This material is an excellent substitute for glazed bricks, and produces a surface like porcelain. The standard colours are white and red. The address of the syndicate is 25, Billiter Buildings, London, E.C.

#### THE KETLEY BRICK CO., LTD.

The exhibit of this firm of manufacturers of terra cotta ware is one which cannot easily be overlooked. It takes the form of a fine doorway, suitable for an entrance to a gentleman's grounds. It is about 18ft. high, and is capable of being enlarged. It is built with their B.B. brand of best pressed facings. They have also a general display of brindle, panels, kerbings, garden edgings, &c. The address of the firm is Magersfield, Brierley Hill, Staffordshire.

#### W. GRIFFITHS.

This stand fully illustrates the value of the speciality manufactured by Mr. W. Griffiths, of 39, Hamilton House, Bishopsgate Street Without, London, E.C. It has the appearance of having been built with glazed bricks, but on application to the gentleman in charge our representative was told that the bricks had been treated with "Opalite." This is a patent material for glazing bricks and wall surfaces. The exhibitor claims that the material is imperishable, and does not lose its beautiful polished surface by exposure. It is not limited as regards colour, several tints being obtain-

able. This glaze can be applied to old brick-work equally as well as to new, and, as it is cheaper than ordinary tiling, its wide adoption is only likely to be a matter of time.

#### ROBERT ADAMS.

The exhibit at this stand comprises models of the various manufactures which are each and all specialties of this firm, whose place of business is at 65 and 67, Newington Causeway, S.E. They include various single and double action spring hinges, door springs, opening gear for fanlights, lantern lights, &c., the "Caledonian" being very effective. Mr. Adam's exhibit of fanlight openers is perhaps the most comprehensive and varied that has yet been brought together. The "X IT" double swing doors, with Victor spring hinges and frame door bolts, deserve special mention; the striking feature of the latter being that whilst any rush at the emergency doors instantly releases the bolts, allowing the doors to swing outwards, yet

THE SECRET STAY FAN OPENER.

SKYLIGHT GEARING.

feature of which is a hollow spindle connected with a tap at the top, a turn of the plug of which will at once indicate if the pipe communicating with the valve is free or choked. A combination radiator and towel airer is also exhibited, this being formed of lengths of wrought tubing united at the junctions by iron cast *in situ*.

#### W. PARKINSON AND CO.

Messrs. Parkinson and Co., of Bell Barn Road, Birmingham, have a very attractive array of gas cookers for domestic and hotel use. The Victoria patterns of gas fires in various designs and enamelled black are in evidence on the stand. Parkinson's patent breakfast griller is no doubt an excellent affair to cook one's breakfast, especially quickly and cleanly. The patent prepayment gas meter supplied by this firm is used in conjunction with the "P. P." cooker, and this is certainly a good combination. The meters are supplied in both the wet and dry forms.

THE "EMPRESS VICTOR" DOOR SPRING.

VICTOR SPRING HINGE SINGLE ACTION.

THE VICTOR PNEUMATIC SPRING SINGLE ACTION.

EXHIBITED BY ROBERT ADAMS.

from the outside the doors are securely fastened, a key being necessary to gain admittance. Reversible windows are also shown fitted with the Pullman patent sash balances (spring) in place of the usual weights, a metal ribbon replacing the customary cords of weight hung sashes.

#### THOMAS POTTERTON.

Mr. Potterton, of Cavendish Works, Balham, S.W., who is now associated with Mr. Frederick Dye, exhibits his well-known dual hot water boiler, as adapted for heating from the kitchen fire, the two halves of which form a zig-zag flue, and thus expose a large heating surface to the action of the heat escaping into the chimney. Upon superficial observance it would seem that a boiler with so many angles and corners would offer a great inducement for a good collection of "fur," and, still further, offer great difficulties in the way of its removal. But "the proof of the pudding is in the eating," and Mr. Potterton asserts that they give no trouble in either direction, experience having proved that the only deposit takes place at the lower portion—that in direct contact with the fire. Potterton's indicating safety valve is also shown, the

#### THE CRANSTONE ENGINEERING WORKS, LIMITED.

Hoisting tackle of different kinds forms the principal exhibit of this firm, whose works are situated at Hemel Hempstead. A dinner lift is also shown; but the chief item of interest is a patent self-sustaining, quick-speed, sack hoist, the only quick-speed hoist, so the firm claim, which is self-sustaining. But there it is, ready to sustain its reputation as well as its load before anyone who cares to inspect it and critically test its capabilities.

#### JOSEPH KAYE AND SONS, LTD.

Kaye and Sons' stand always seems to be a centre of attraction in any exhibition; and visitors who may be drawn thither by other than feelings of curiosity will find the exhibit worthy of a close inspection. The name of Kaye has long been associated with much that is novel and of value in the way of locks and fastenings, and their automatic safety railway carriage door lock is so well known that it is almost superfluous to draw attention to it. The firm's panel door fittings, also, are highly ingenious, providing that doors with which they are fitted, whilst perfectly secure as against intrusion from the outside from anyone

not duly provided with a key, nevertheless, instantly yield to a slight pressure from the inside, throwing the doors open outwards. Kaye's locks and fittings for ordinary doors also display considerable ingenuity in their design, and indicate the firm's best efforts to baulk the enterprise of Mr. William Sykes. The works of Kaye and Sons are at Hunslet, Leeds, and the firm's London address is 93, High Holborn, W.C.

#### BRILLIANT SIGN CO., LTD.

This firm's stand is resplendent with a display of numerous examples of "Brilliant" concave metal letters and lettering, &c., in wood, glass, metal, enamel, and opal, for all kinds of effective display, for tablet and window decoration, and for any and every advertising purpose. Readers who desire to know further of the company's specialities should apply for specimens and prices at 38, Gray's Inn Road, London, W.C.

#### THE MOSAIC MANUFACTURING CO.

This firm's exhibit comprises varied examples of their specialities in the way of Roman and Venetian marble mosaics, Venetian glass mosaic, and ceramic mosaic, in many pleasing patterns, with a nice range of colouring. Pattern sheets and further particulars may be had from the company at 119, Pentonville Road, London, N.

#### THE WELSBACH INCANDESCENT GASLIGHT COMPANY LIMITED.

The company have made good use of the special position allotted to them, and have a striking display of the illuminative and decorative goods they manufacture. Claiming to have a monopoly of the rare earths with the salts of which their "mantles" are impregnated, the Welsbach Company (of York Street and Parmer Street, Westminster, S.W.) claim that the average life of their mantles is ten times that of any of the manufactures of competing companies. Of the advantages of the incandescent lights over the ordinary burners nothing need be said, the facts being too firmly established to need any additional bolstering up. But the beauty and attractiveness of the light is much enhanced by the elegantly designed fittings shown, and not less so by the beautiful designs in glassware used in conjunction therewith.

#### T. C. FAWCETT LTD.

This Leeds firm (Whitehouse Works, Hunslet) are exhibiting several specimens of their hand and power brick and tile making, pressing and repressing machines, and also samples of the various manufactures for which they make special machinery. The firm seemed to be doing business, for we noticed three of their exhibits were ticketed as "sold" early on the day following the opening ceremony.

MASON'S PATENT NON-SLIPPING STAIR TREAD,  
EXHIBITED BY THE SAFETY TREAD SYNDICATE, LIM.

#### DOWSON, TAYLOR, AND COMPANY, LIMITED.

Armoured fire-proof doors, consisting of two or three thicknesses of wood and covered on either side with tinned steel sheets of small size, fixed without solder, is the exhibit of Messrs. Dowson, Taylor, and Co., Limited, of 14, Victoria Street, London, S.W. It might seem a peculiar idea to use wood in the construction of anything desired to be fireproof; but when it is considered that the steel armour effectually excludes air, and that consequently sufficient oxygen could not reach the wood so as to support combustion it is easy to realise that such a door possesses many advantages over a door made of solid iron, which, in addition to being heavy, easily and quickly twists under the influence of excessive heat.

#### THE SAFETY TREAD SYNDICATE LIMITED.

The prevention of accidents to life and limb is a worthy aim, and the The Safety Tread Syndicate, Limited, of 15, Barbican, London, E.C., have this object in view. The manner in which they are prosecuting it is by means of non-slipping stair treads, hydrant and man-hole covers, coal plates, etc., all covered with their speciality, Mason's patent, unwearable, non-slipping treads. The treads are a combination of steel, iron, or other hardened metal with lead. One advantage they possess which should make them invaluable to hospitals, is that they are comparatively noiseless, the lead only coming into contact with the feet. Worn steps can be repaired by this system much more cheaply than with stone. Every step of the Tower Bridge is covered with this arrangement, and the number of government buildings in which it is used should render any further recommendation unnecessary. The accompanying illustration shows the manner in which worn stone or concrete steps are renovated with the "unwearable" non-slipping treads. For worn stone or concrete steps, cut mortice holes for caulking nuts in tread of step, as shown at A and B in the illustration. Chip down the face of the tread on step at ends (if not worn) the thickness of the patent covering, so as to obtain the original level of tread. Put the covering in position, and test the same with spirit level both lengthways and across the step. Then run in caulking nuts with lead. When these are fixed, the patent covering can be taken off, the steps made up with cement or concrete, and the covering refixed. Care should be taken to chip away back of step, as shown in the illustration, so as to give a dovetail key to the cement, or whatever material is used for making up the back of steps. If 3½ in. nosing only is desired, no bearing irons are required, only caulking nuts.

WITHOUT

WITH

THE ANTI-SPLASH TAP, MANUFACTURED BY  
THE ANTI-SPLASH SYNDICATE.

#### NEWMAN WILKINSON.

Mr. N. Wilkinson, of 2, Gresham Buildings, Basinghall Street, London, E.C., is exhibiting a novel arrangement which fits on to any ordinary water tap, and prevents splashing. This anti-splash is made of excel silver, a metal claimed to be perfectly hygienic and non-corrosive. The illustrations given above of a water tap without the nozzle, and one with it, render any further description of its action needless. Mr. Wilkinson is also exhibiting a variety of electric lamps.

#### YATES, HAYWOOD, AND CO.

This exhibit comprises a large collection of high-class wood and iron mantelpieces and overmantels, some of the designs being exceedingly chaste. In addition thereto the goods on view comprise a varied selection of stoves, interiors, and mantel registers. Shown in operation are specimens of the firm's patent "Quadrant" kitcheners, and the patent "Guinness" self-setting range. Messrs. Yates, Haywood, and Co.'s address is 95, Upper Thames Street, London, E.C.

#### THE INCANDESCENT ACCESSORIES AND MAINTENANCE SYNDICATE, LIMITED.

In addition to a good display of daylight and incandescent burners and mantles, together with accessories of a varied and pleasing description, the Syndicate are showing what they term the "Thrifty" incandescent burner—a special, mantleless burner of an improved argand type. Whilst not throwing so good a light as the ordinary burner with mantle, this burner is worth attention as obviating the expense of mantles, which many find to be a great drawback. Further particulars and prices may be gleaned by addressing the Syndicate at 11, Farringdon Road, 59a, Farringdon Street, or 24, Hatten Garden, London, E.C.

#### MOORWOOD, SONS, AND CO., LTD.

Occupying a large stand against the wall of the hall, Messrs. Moorwood, Sons, and Co., Ltd., of Sheffield, and 15, Southampton Row,

"A" DESIGN.

"B" DESIGN.

"MANSFIELD" VENTILATORS. EXHIBITED BY THE MANSFIELD PATENTS COMPANY, LTD.

Holborn, make a large exhibit, primarily devoted to cooking-ranges and appliances suited for hotels, clubs, institutions, &c. A ventilating ward stove may also be mentioned, and several fireplace suites of elegant design are worthy of close inspection.

**THE MANSFIELD PATENTS COMPANY, LIMITED.**

This firm has a stand which contains so great a variety of sanitary appliances that we will not attempt to enumerate all of them, but will select a few of the most important. The "Mansfield" closet basin is one which ought to be durable, as it does not contain any perishable or corrosive materials, and brass ferrules are conspicuous by their absence. Rigid iron bends do not find a place in its manufacture, and, therefore, there is no lack of vibration. The "Mansfield B" block for connecting lead soil and drain pipes is a more lasting affair than a brass ferrule. To obtain an iron pipe junction which will stand any pressure or strain, and be proof against leakage of gas or water, is not easy. The "Mansfield" Company claim that their patented sanitary iron pipe junction possesses these advantages. Many other things are also shown, including several patent chimney pots, heating radiators, and ventilators. The "Mansfield" ventilator, of which we give three illustrations, is an excellent arrangement. The address of this firm is Mansfield, Notts.

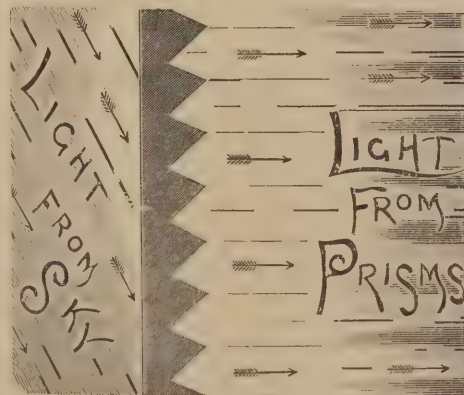

**BRITISH LUXFER PRISM SYNDICATE, LTD.**

This exhibit is a remarkable one in many ways, but the awkward lighting of the stand does not do justice to the articles exhibited. In the design of the Luxfer pavement lenses a radical departure has been made from all other pavement prisms. The latter attempt, unaided, to throw the light to the rear of a basement; the former throw it downward, and upon a plate of window prisms which, in its turn, throw the light horizontally into the apartment. The whole of the Syndicate's window glazing, whether plain, ornamental, or prismatic, is of the style they describe as "Electroglass." Briefly, the pieces of glass are cut to pattern and size and laid upon a forming table; strips of copper ribbon are then placed between each adjacent piece of glass; the joints are temporarily soldered, and the whole sheet is then immersed in a copper depositing bath, in which the deposited copper forms a flange on each side of the glass, securing it firmly in position, and also filling up all interstices caused by irregularities in the cut edges of the glass, thus making, as it were, a continuous sheet of glass and metal. The compactness of "Electroglass" may be judged when it is stated, and evidence to prove the statement is not wanting, that when a sheet of it is subjected to flames until it is red hot,

and then played upon with cold water, though each square of glass may be fractured into a thousand pieces, its homogeneity is such that the plate remains intact and thoroughly fireproof. Fire will never reach beyond it until the woodwork in which it may be fixed is burned away. The syndicate are also showing some neat and intricate specimens of electroglass as applied to the doors of bookcases, and also what, for want of a better term, we may describe as electroglass lead lights, the usual lead strips being replaced by the copper strips with the electrical deposit on either side. Electroglass is an undoubted triumph, as also are the Luxfer prisms; and the fire-resisting qualities of the former are tested before anyone interested upon any day at the Syndicate's Works, 16, Hill-street, London, E.C. Those interested, but unable to

attend, should send for a Manual of Luxfer-prisms and Electroglass. The illustrations show one of the Luxfer prisms with a sectional diagram.

**WILLIAM BROWN.**

The "Bricklayer Steeplejack," as Mr. Brown, of 55, Beechey Street, Oldham, terms himself—he claims the distinction of being the only "jack" who is a practical brick-setter—has a stand by the wall, on which he makes a good display of various items used in the pursuit of his highly dangerous calling, as well as a number of photographs of jobs he has successfully negotiated, such as imparting rigidity and plumbness to shafts which had acquired a more or less decided tendency to assume the horizontal position; lengthening stacks whose already giddy height was deemed insufficient, without stoppage of works; and razing to the ground those whose weather-beaten sides were no longer able to stand the strain and stress of tempest. A feat in the latter category of which Mr. Brown is proud—it creates a record—is the throwing of a shaft 210ft. high, and piling up all the débris within 80ft. of the base, a feat witnessed by over 30,000 people, and of which Mr. Brown says in his own forcible way he "meant to do something, or be under it when it came down." Mr. Brown exhibits several contrivances of his own invention, one being a building-in holdfast to take a copper tape lightning conductor with a detachable clip, and another being one that should, if better known, be of use to the building trade generally—patent clips to replace ropes for lashing scaffolding. When lengthening chimneys whilst work is still going on beneath, the heat generated is sufficient to char ropes, consequently their use on such jobs is attended with great risk, hence the clips which, in point of time saved, must effect a great economy in the cost of scaffolding a building. Samples of special close textured bricks, specially made for chimney work by the Whinney Hill Plastic Brick Company, are also exhibited, and various styles of terminals for lightning conductors;

A ROOM BEFORE THE APPLICATION OF THE PRISMS.

THE SAME ROOM WITH THE PRISMS.

but the most elaborate exhibit is a polished copper nine-pointed "magnet," or terminal designed as an architectural feature for capping spires, &c.

#### J. B. STONE AND CO.

The stand of Messrs. Stone and Co., of Chiswell House, 135, Finsbury Pavement, London, E.C., representing the Fox Machine Company, The New Britain Machine Company, and the S.A. Woods Company, seemed to be a centre of attraction, much interest being apparently manifested in the exhibits, possibly on account of the intricate work being done upon a 36in. band saw with laminated wood driving and saw straining wheels, the band saw in use being exceedingly fine. The Fox trimmers were being shown in several sizes trimming the edges of boards, an adjustable fence, perfectly rigid at any set angle, allowing cuts to be made in any desired direction. These machines worked exceedingly well and with evident ease, the cuts being as smooth as if dressed with a finely-set smoothing plane. We were informed that several thousands of them had already been sold in London alone. A combination rib and cross-cut saw bench with disappearing saws, a railway cut-off saw, a 24in. thicknessing machine, a surface planer with sliding tables for easy access to the cutter bar, and a wet or dry knife grinder, were also shown at work. A noticeable feature of the installation was the slackness of the driving belts, gripping of the pulleys being secured by double spiral grooves cut in their face.

#### T. W. PALMER AND CO.

Messrs. Palmer's exhibit comprises unclimbable iron fencing and gates, hurdles, galvanised cisterns, dustbins, &c. Their works are at Stockwell, and their offices and showrooms at 5, Victoria Street, Westminster, S.W.

#### GEORGE JENNINGS.

The well-known sanitary engineer of Lambeth Palace Road, London, S.E., exhibits a good collection of his improved sanitary and building appliances, comprising baths, water closets, lavatories, sinks, urinals, bonding bricks, damp-proofing courses, drain pipes, traps, &c.

#### JOHN TANN.

John Tann, of 11, Newgate Street, London, E.C., who boasts a business pedigree in the safe line of over 100 years, has a good show of various kinds of fire and thief-resisting safes, &c.

#### ASHTON AND GREEN.

This firm, whose business address is 11, Bevis Marks, London, E.C., have a good show of chimney-pieces in marble, enamelled slate and wood, stoves, interiors, tile hearths, curbs, baths, sanitary goods, and general builders' ironmongery, together with a selection of ranges in operation, showing the many improvements effected by the firm in this class of goods.

#### THE OWEN STONE CO., LIMITED.

The Owen Stone Company, whose works are at Worpleston, Surrey, with offices at 22, Austin Friars, London, E.C., exhibit several specimens of their stone both in a rough and finished form. Owen stone, it should be mentioned, is an artificial product of a creamy colour, prepared from dry quartz sand, dug in the vicinity of the works, and mixed in a dry state with a percentage of hydraulic lime. Still in a dry state, the mixture is packed into moulds and placed in a steel cylinder into which water, near the boiling point, is admitted. As the lime slakes, the material, having no free play, is compressed within itself, which tends to render the resultant stone very compact.

#### THE BRITISH COMPO BOARD CO.

The present partial deadlock in the building trade—so far as plastering is concerned—is the extremity which provides the opportunity for

the introduction of plastering substitutes, and the British Compo Board Co., of 18, Roscoe Street, London, E.C., are attempting to improve the occasion by showing at their stand the adaptability of their product to replace the plasterer with his attendant mess. Compo board consists of fillets of wood about 1in. wide and 1/4in. thick, the grain of adjacent pieces running in contrary directions, cemented together with a fireproof cement. On either side of the wood core compact, damp-proofed paper boards are cemented, and when the whole is pressed between iron plates a very compact substance is produced. Compo board is manufactured up to 4ft. wide and 18ft. in length, and thus readily lends itself to treatment for covering ceilings, walls, partitions, &c., large expanses of the material being easily broken up by affixing mouldings to its surface. It takes paint or distemper well, is fixed by nails in the ordinary way, and will doubtless command a large sale for many purposes where a large smooth surface is an advantage.

#### CHAS. ATKINS AND NISBET.

What is "Stripso?" "Stripso" is a composition for the rapid removal of paint, varnish, &c., without occasioning any damage to the wood; and this preparation, so Messrs. Atkins and Nisbet (of 1, Water Lane, Great Tower Street, London, E.C.) allege, has not the slightest injurious effect upon any part of the work. Shown in use at the stall, it certainly seemed to be all that was claimed for it.

#### J. SAGAR AND CO.

Woodworking machinery makes a brave show in this year's exhibition, and Messrs. J. Sagar and Co., of Canal Works, Halifax, whose machinery bears a reputation of the highest class, are well to the fore with a full line of machines to suit general requirements. Their "Premier" combined hand and roller feed surfacing, thicknessing, and moulding machine is a standard tool, accommodating stuff from 1 1/2in. to 7 1/2in. in thickness, and up to 20in. in width. Circular saws, band saws, a fourcutter moulder, a vertical spindle moulder, a tenoning machine, a mortising and boring machine, planing and knife-grinding machines, complete the list of a useful and high class exhibit.

#### W. AND C. JOHNSON.

A good collection of various hardwoods in boards, plank, and square is shown by Messrs. Johnson, of 118, Hoxton Street, London, N.E. Specially deserving of mention are some very fine quality oak, walnut, and mahogany squares and boards; also a fine board of American whitewood, 3ft. 3in. wide.

#### SAMUEL WRIGHT AND CO.

Plain and decorative fibrous and fireproof plastering is the exhibit of Messrs. Wright and Co., of Crown Works, Andre Street, Amhurst Road, Hackney, London, N.E., a special feature being made of fibrous plaster slabs, with a perfectly smooth face, of which Messrs. Wright are supplying a quantity to a job at Nottingham which was stopped owing to the plasterers' dispute. The firm also manufacture artificial stone, and were exhibiting samples thereof.

#### THE EDISON AND SWAN ELECTRIC LIGHT CO., LTD.

This well-known electric lighting firm has, perhaps, one of the most striking exhibits. It is in the form of a kiosk, and shows nearly all their latest improvements in electric lighting. Special attention should be paid to the Ediswan closed motor, which is thoroughly dustproof, and has a patent clutch pulley. A variety of high voltage switches is being shown. The attention of the visitor is sure to be drawn to the beautiful brass electrolier suspended from the roof of the stand, and it is almost certain that he will be attracted by the Queen lamp. This is a prettily-designed lamp; its light is covered with a delicately-shaded opal top, and its whole appearance is artistic. A quality it possesses is sure to make it a popular lamp, i.e., a large increase of light without a greater

consumption of current. They have a life-size bronze statue of a page holding an electric light in the centre of the stand, which is a fine ornament for a hall. Although the stand is at the end furthest from the door of the electric lighting appliances section, the eye will, perhaps, be first drawn to it, owing to the trade mark of the firm, "Ediswan," in various coloured lights, being placed on the top of the front of the stand. The address of the firm is 36, Queen-street, London, E.C.

#### GEORGE B. DAVIS.

Mr. Davis, of Westminster Sanitary Works, Great George Street, London, S.W., has a very nice exhibit opposite the stand of THE BUILDERS' JOURNAL. A large number of lavatories are being shown, among which is the "Empire" twin lavatory. This is a novel arrangement of the basins, and is of special advantage where space is limited. Although the lavatory is but 3ft. wide, it affords every facility and comfort for two persons, in fact more than with a straight lavatory of greater width. A bath made of sheet copper that is being shown is not a very pretty affair to look at, but it has qualities that recommend it. By a very simple manipulation a spray plunge, wave, douche, or shower can be obtained when taking one's morning constitutional bath. It is an excellent bath, although clumsy in appearance. Examples of patent stall urinals, "syphonic" closets, ventilating apparatus, all kinds of baths, improved quick waste sinks, help to make a very complete exhibit of sanitary articles.

#### JAMES WOODWARD.

Mr. James Woodward, of Swadlincote, near Burton-on-Trent, has a very large stand at the Liverpool Road end of the hall. It is devoted to a large number of stoneware pipes and connections, channels for manholes, intercepting traps, glazed bricks, urinals, and closets. The "Archer" patent jointed pipe is being exhibited; it is a pipe for laying in waterlogged ground. Ewing's X-centric shoulder pipe is being prominently displayed, and the pipe is suitable for sewers, drains, and electric cables. It has a gas and watertight joint, and the mode of laying consists in placing a roll of clay or plastic round the bottom of the socket before the pipe is driven home. The socket is then packed with Portland cement in the usual way. Mr. Woodward is showing a case of glazed bricks in various colours, which are certainly well made.

#### HALL AND BOARDMAN.

Messrs. Hall and Boardman, of Swadlincote, Cadley Hill Collieries, near Burton-on-Trent, occupy a very prominent position at the Exhibition. There is a very large selection of sewerage pipes and fittings on view—not an attractive exhibit from the spectacular point of view, but worthy of the attention, nevertheless, of those interested in sanitary matters.

#### DIESPEKER AND COMPANY.

We noticed this stand at some length in our last week's issue, but by a printer's error it was stated that the firm had laid about 1500 yards of mosaic for the Metropolitan Asylums Board; the quantity should have been 15,000 yards. The error was corrected in our second edition.

#### THE NEWELLITE GLASS TILE CO., LIMITED.

The Newellite Glass Tile Co., Limited, of 139, Cannon Street, London, E.C., are showing their patent wall tiling. By means of the Newellite patent process a sheet of opal glass of any colour is converted into an opal tile of great beauty, soft tone, and high reflecting power, which, properly fixed with a backing of cement to a wall surface, is practically indestructible. By means of a second patented process a design in any colour or colours can be transferred and permanently burnt into the surface of this tile, with the result that at a very slight cost an effect is produced equal to the most beautiful specimen of decorative glass, faience, or ceramic ware.

**JAMES GIBBONS.**

This stand has an artistic display of brass-work of nearly every description. The top of the stand is surrounded with embossed brass which is very finely executed. Nearly every description of locks seems to have found a place in the show case, and Mr. Gibbons can fairly claim to be a builder's complete ironmonger. The E. C. Reversible window is a simple affair, and the outside of the window can be cleaned from the inside. He is showing two kinds of this window, one which can be put into existing cases, and another which has to be put in when the house is being built.

**WILSON AND CO.**

In addition to the articles mentioned last week as being exhibited by Messrs. Wilson and Co., of 24, Harrison Street, Gray's Inn Road, London, W.C., may be mentioned their "safety" pavement lights. These pavement lights prevent slipping, and also meet the objection made to the projecting studs on the surface of pavement lights, especially in front of shops and at entrances. The upper portions of the frames are made entirely of lead, and constitute a firm and even hold for the foot, as well as forming a much more sightly pavement light, as the lead is finished quite flush with the glass. Messrs. Wilson and Co. also make these pavement lights with the lead bars partly intersected with ornamental tiles or mosaic work.

**THE KAURI TIMBER CO., LTD.**

The Kauri Timber Co. (West Australia) Ltd., whose agents are Messrs. Fry, Morgan & Co., of London, are exhibiting a great many samples of jarrah wood, polished and unpolished. The specimens shown illustrate the value of the wood under certain conditions. Some athletic accessories made from the pine are being exhibited, and the make and finish of these is very good.

**THE MOSAIC MANUFACTURING CO.**

At stand No. 52, Row B, the Mosaic Manufacturing Co., of 119, Pentonville Road, N., are exhibiting a number of very fine samples of Roman and Venetian marble mosaic. The original designs of many of the floors recently executed by this firm are also on view. Their stand, which has been formed so as to allow a passage from Rows B to A, is paved with black and white Roman mosaic.

**MESSRS. GIBBS AND CANNING.**

This firm is exhibiting a very fine buff terra-cotta porch, which has been specially designed for the exhibition by Mr. C. H. Townsend, A.R.I.B.A. It is typical of the work they turn out. White and salt glazed bricks are a speciality of the firm, whose address is, Glascote, Tamworth.

**THE WADE DISINFECTANT SYNDICATE, LIMITED.**

This syndicate is exhibiting its patent self-acting "Government" disinfectant, which will fit any flush tank or cistern. The apparatus consists essentially of a containing vessel, from the upper surface of which, and communicating with the interior, rises a curved tube, the free end of which descends to within about an inch of the bottom of the cistern. On the upper surface of the containing vessel, and flush with it, there opens a small bore tube for the ejection of the disinfectant, the quantity of which is regulated by a sliding tube in which the free end of the tube terminates. The action of the disinfectant is purely automatic.

The Wigan Carpenters and Joiners have been awarded an advance of  $\frac{1}{4}$ d. per hour on their present wage by the arbitrator appointed by the Board of Trade. The workmen asked for an advance of 1d. and a reduction in hours from 54 $\frac{1}{2}$  to 49 $\frac{1}{2}$ . The award gives no reduction in hours, and is to come into operation on September 1st.

**SMOKE ABATEMENT SECTION.**

"Smoke" is in the air. In other words, the subject of the pollution of the atmosphere by coal smoke is beginning to attract serious attention. That a smoke-laden atmosphere is bad from every point of view is admitted; and, although it is asserted that the prevention of this contamination is not only possible, but even easy and profitable, these theories yet remain to be converted into proven facts. So long has the smoke fiend been with us that we have almost ceased to cavil at his objectionable presence, except at such times as a "London particular" holds in its murky embrace the vomit of a million sooty uptakes. Now the old order changeth, and things in this particular direction are to become new—that is, if the Coal Smoke Abatement Society can accomplish the aims of its founders. As a step in the right direction, a Smoke Abatement section is found located in King Edward's Hall; but in spite of the fact that medals, designed by the eminent president of the society, Sir William Richmond, were offered as awards, the section cannot be pronounced a decided success. We were hoping to find—and were disappointed in not finding—a goodly display of inventions faculty competing for public favour. Whilst stoves fed with oily or gaseous fuel are certainly coal-smoke preventers, they leave the larger problem untouched. But an Englishman loves a coal fire—something he can poke at; then what is wanted, if we are to retain our national characteristic, is some method of insuring that the products of the combustion of coal shall not escape into the atmosphere, which we have to pass through our lungs, laden with carbon in the form of soot. "Soot," said Dr. Julius B. Cohen, in a lecture delivered before the Leeds Philosophical Society, "is not pure carbon; it contains about 15 per cent. of a thick oil, by virtue of which it adheres tenaciously to everything, so that much of it cannot be removed by rain. Then, not only should we gain from an hygienic point of view, but also from the architectural standpoint, if the smoke nuisance could be successfully combated.

Owing probably to the disappointing character of the majority of the exhibits, the gold and silver medals offered by the Coal Smoke Abatement Society have not been awarded. Bronze medals, however, have been awarded to E. E. Pither for his "Ever Radiant Stove" for anthracite coal, and to the London Warming and Ventilating Company for their Anthracite Drawing-room Stove. The judges were Messrs. Raphael Meldola, F.R.S., H. A. Des Vaux, M.D., Stephen H. Terry, M.I.C.E., Ernest Newton, G. Wyld, M.D.

**HY. ROSSELL AND CO., LIMITED.**

This firm, whose address is Waverley Works, Effingham Road, Sheffield, exhibit an automatic attachment connected to the furnace door of a steam boiler, by means of which, at each time of firing, an amount of air is admitted in sufficient quantity to ensure perfect combustion of the gases generated, and at the precise moment required.

**ERNEST E. PITHER.**

At this stand a "Dual" kitchen range is shown in action, burning "slack" coal, of which the average consumption of a 5ft. range is set down at 5 $\frac{1}{2}$ cwt. per week. The construction of the fire of this range is peculiar; for, although the fuel is fed at the top in the ordinary manner, the flue opening is at the bottom, consequently all smoke given off by the coal is drawn through the fire and entirely consumed, the residue from the flue taking the form of a grey dust, without, apparently, a trace of carbon left behind. Mr. Pither, whose address is 36, Mortimer Street, Cavendish Square, London, W., also exhibits an independent smoke-consuming range, "The Thrifty," and a galley stove designed upon the same principles, for an exhibit of which, in the nautical section of the Cookery and Food Exhibition at the Imperial Institute, the firm was awarded a diploma, of which they are justly proud. Independent heating

apparatus, designed upon the same lines, is also a speciality of the firm, and one of these boilers, with an 8in. fire, consuming 6 $\frac{1}{2}$ cwt. of slack per week, is giving a hot water supply, consisting of four baths and thirteen draw-off taps, to twenty families and eight workshops in a block of London County Council buildings. In connection with this exhibit, Milne's anti-down-draught chimney-pot is shown. Strongly made of galvanised iron or steel, and painted

COOKING RANGE. EXHIBITED BY  
ERNEST E. PITHER.

a terra-cotta colour, it has much to recommend it as a substitute for the usual unsightly "tall-boy." Its action being syphonic, the main flue is not affected by atmospheric depression, and the up-draught is very considerably increased; whilst there being no loose or revolving portions, no impediment is offered to the sweep's brush when the flue requires cleansing.

**RICHMOND & CO., LTD.**

At this stand Messrs. Richmond, whose show rooms are at 132, Queen Victoria Street, London, E.C., are exhibiting "The Quaker Grate," a stove designed to burn coke or anthracite coal, and for which it is claimed that it is the first successful appliance of the kind calculated to occupy the place of the ordinary English open fire grate, while competent to burn the cheapest description of fuel; hitherto, it has been impossible to burn such fuel, except in closed stoves, which have a dull appearance and yield a "stuffy" heat without ventilating the room. In "The Quaker Grate" a wire gauze blower creates a strong draught through the fire, without obscuring the glow of the fuel. A feature of this grate is a rocking bottom, whereby the contents of the fireplace can be freed from ashes to the last morsels of combustible fuel. It can also be used for burning ordinary coal where the chimney gives any trouble due to defective draught. The cost of fuel, with coke at 6d. per bushel, is set down at from 2d. to 3d. a day only. In the Arcade Messrs. Richmond have another stand with a "penny-in-the-slot" installation, comprising a prepayment gas meter, a "Model" gas cooker, a pendant light, and two gas brackets, the whole being such as many gas companies will fit up and supply to users on rent. A good feature of these gas ranges is that all the internal fittings can be immediately removed should they from any cause become choked and need cleansing. Another point meriting mention is that the usual burner at the front of the hot plate is divided into two parts, each governed by its own top, so that a separate set of holes is used for either boiling or grilling, they being arranged so as to perform their work in the most effective manner. Several other designs of gas stoves are also on view.

**THE DOMESTIC CRATER COMPANY, LIMITED.**

This company is attempting to fight the smoke demon by means of a simple appliance, the object of which is to consume the smoke and waste products by converting them into radiant heat. This is accomplished by supplying heated air to the centre of combustion. An iron, tunnel-shaped grating is placed in the fire-grate, and a fire of coal or coke built over and around it; the tunnel is thus surrounded with glowing fuel which

heats the air within it to a very high degree. The constant stream of superheated air which thus flows through the fuel compels perfect combustion. Many of these tunnels are being shown at the stand of The Domestic Crater Co., Ltd., of Bourdon Street, Berkeley Square, London, W., and the extreme cheapness and usefulness of the article, together with the important features, which must not be overlooked, that it can be adapted without the slightest alteration to any existing grate,

andirons, and has a very attractive and natural appearance. The "Salamandre" close stove, with a mica front, automatically regulates the draught, and is shown at the stand in working order. The anthracite coal, which is burnt in a number of the firm's stoves, gives off no smoke when burning. The firm claims that it has great heating powers and requires less attention than ordinary coal. The "Cheminée" stove, which is here illustrated, has a heating capacity of 4,500 cubic

## ROAD-MAKING MATERIALS AND PLANT.

This section of the Exhibition has been organised by our contemporary "The Surveyor." One of its divisions is a loan exhibit. A sectional drawing of a Roman roadway has been lent by Mr. W. Banks, of Rochester. This road was constructed across marshy

A VIAGRAPH RECORD OF PART OF THE VICTORIA EMBANKMENT BETWEEN TEMPLE STATION AND TEMPLE GARDENS. UNEVENNESS 152FT. TO MILE. (HALF SIZE.) EXHIBITED BY J. BROWN.

should make it popular. For use with kitcheners special fire-brick appliances are made, supplied with single, double, or triple tunnels, according to the size of the fire.

### THE BELCHER SMOKE PREVENTER COMPANY.

This company, of Ethelburga House, 70 and 71, Bishopsgate Street, London, E.C., exhibit the "Belcher" apparatus, which is applicable only to steam boilers, and which has for its object the prevention of smoke by raising the combustion of the fuel to the highest degree, and at the same time affording increased efficiency in generating and maintaining steam. The apparatus consists of an air pipe fitted with regulating discs, and with various valves and tubes fixed on the outside of the boiler, by means of which a forced draught of air and steam is introduced into the furnace. By means of a "spreader" in the inside of the furnace the draught is concentrated upon the fuel.

### THE LONDON WARMING AND VENTILATING COMPANY, LIMITED.

At the stand of the London Warming and Ventilating Company, Limited, will be found a number of stoves specially adapted for

feet, and will burn continuously with anthracite coal for twenty-four hours at a cost of 3d. The stove is provided with a regulating plate, which works automatically, thus ensuring the exact amount of draught required for the proper working of the stove, and at the same time acting as a ventilator.

### THE INCANDESCENT FIRE MANTEL AND STOVE CO., LTD.

As a means of burning coke or anthracite coal in an ordinary grate, the above company, of 53, Victoria Street, Westminster, S.W., show their method of insuring the requisite supply of air necessary to the proper combustion of non-bituminous fuel, the "mantel" consisting of a wire grille to the lower portion of which a series of fireclay tubes is attached.

### S. CLARK AND CO.

A display is made at the stand of this firm—address, Park Street, Islington, London, N.—of gas and oil heating stoves of various forms and sizes and for all purposes. They are all constructed upon the "syphon," or condensing principle, all the products of combustion not condensed being again passed through a hot chamber, wherein perfect combustion then takes place, making these stoves safe for use anywhere. Special mention may be made of the "Syphonette" series of stoves, which are constructed so as to radiate a downward heat, throwing the warmth generated therein upon the floor of the apartment.

### PERRY'S CERTAINTY SMOKE CURING COWL CO.

Although having only a very indirect bearing upon the subject, the exhibit of this firm, whose address is at 178, London Wall, E.C., is found in the smoke-abatement section. Their cowl can be fixed to any ordinary chimney, and having a series of pockets arranged round the sides, air currents are caught in whatever direction the wind may be travelling, thus, it is claimed, always creating an up draught in the flue, whilst a conical hood prevents any down, even though a gale be blowing.

St. Jude's Vicarage, Wolverhampton, has just been erected in Tettenthal Road, at a cost of £2,200. The building is of red brick, with stone dressings and tiled roofs. The contractor was Mr. James Herbert, and the architects were Messrs. John Weller and Sons.

**The Sett-making Trade.**—A conference took place on the 19th inst. between the Scottish Quartermasters' Association and the Aberdeenshire Branches of the Settmakers' Union, when the employers conceded the following increases on the prices on the various sizes of setts:— $3\frac{1}{2}$  by 7 setts from 8s. to 9s. per ton; 3 by 6, from 10s. to 10s. 6d. per ton; 3 by 5, from 8s. to 8s. 6d. per ton; 4 by 7, from 6s. 6d. to 7s. per ton. It was also agreed that the rate per hour for day work be increased from  $7\frac{1}{2}$ d. to 8d. per hour.

ground, and its foundations are very deep. A photograph of a portion of Roman road-paving has also been lent by the same gentleman. Mr. J. W. Bradley, of Wolverhampton, has lent several maps and portraits. An old engraving of the first iron bridge ever erected is among his collection. It was designed by Pritchard, of Shrewsbury, in 1777, and Keynolds and Darby, of Coalbrookdale, were the builders. A photograph of John London Macadam is being shown, which was specially taken for the "Surveyor" Exhibition from a bust in the possession of the Museum Committee of the Bristol Corporation. The Worcester Victoria Institute Committee contribute a fragment of Roman concrete and a photograph of Roman tessellated pavement.

Mr. C. Mayne, municipal engineer of Shanghai, lends the exhibition a sample of road metal, "Diorite Porphyrite," from the Shanghai Municipal Council's Quarry at Ping-Chiao, 150 miles south-west of Shanghai. In spite of difficulties in obtaining dynamite for blasting, the output of the quarry for the last year was 16,781 tons. At the quarry a ten-ton traction engine and a Blake stone-crusher are in use, and rain gauges, thermometers, &c., have been fitted up. The stone, broken to a  $\frac{3}{4}$ in. gauge at the Council's depôts in Shanghai—allowing for interest and depreciation, quarry, freight, &c.—costs 4s. per ton.

Another interesting exhibit, also lent by Mr. Mayne, is a Chinese wheelbarrow, constructed of oak, at a cost of about 16s. The wheel is 3ft. in diameter, and has an iron tyre  $1\frac{1}{2}$ in. wide by  $\frac{1}{2}$ in. thick. Sometimes in the streets of the foreign settlements at Shanghai about fifty wheelbarrows may be seen travelling one behind the other, each carrying two barrels of English Portland cement and pushed by one man. Very frequently, however, a load is carried on one side of the barrow only, so that the edge of the  $1\frac{1}{2}$ in. tyre cuts into the macadam road like a knife, to the great damage of the municipal roads. It has been found, after repeated experiments, that granite broken to pass through a  $\frac{3}{4}$ in. ring, and rolled in the usual manner, is the only kind of macadam roadway that will stand this severe traffic. During 1898 the extraordinary number of 52,546 of these wheelbarrows were licensed by the municipality.

We will now deal with the exhibits of some of the various firms interested in road-making materials and plant.

### J. BROWN.

At this stand the principal exhibit is Brown's patent Viagraph, a new instrument for testing road surfaces. The appliance is, in principle, a straight-edge applied continuously to the road surface along which it may be drawn, and conveying an apparatus for recording on paper a profile of the road surface, and indicating a numerical index of the unevenness of the surface. These taken together give a fair estimate of the quality of the road at the part tested. The specimen

THE CHEMINÉE STOVE. EXHIBITED BY THE LONDON WARMING AND VENTILATING CO. LTD.

burning anthracite coal. Particular attention ought to be paid to Ye Olde Yule Log Gas Fire. This is fitted into a Louis XV. mahogany mantelpiece, brass dogs and bright steel

section here reproduced is from a test recently applied to a portion of the Thames Embankment—about as bad a road as could be found anywhere. The records of the instrument are likely to be valuable to surveyors wishing to test various methods of road maintenance, or to convince local authorities of the need of improvement. Particulars concerning this ingenious appliance can be obtained from Mr. E. Shrapnell Smith, 98, Duke Street, Liverpool.

THE HARD YORK PATENT STONE COMPANY.

The Hard York Patent Stone Company's "Non-slip" stone is used for footway paving, steps, landings (moulded or plain), window and door-heads, window cills, building blocks for docks, harbours, &c., and plain and decorated panels. It is made from the "Silex" stone, which we noticed last week, and is non-slippery. It is made at a great hydraulic pressure, and has a foothold and colour equal to the best hard York stone, and the texture of natural stone is copied with great exactness. Its durability is undoubted, and the quantities used by vestries and in government works go far to show its worth. The address of the Hard York Patent Stone Company is Lightcliffe, Halifax.

W. DUFFY.

No one interested in street paving should fail to examine the system of dowelled wood pavement which is the patent of Mr. W. Duffy, of Gainsborough Road, Victoria Park, N.E. The method employed is to secure the hard wood blocks together by means of dowels or bonding keys of a special type. Thus fastened together, the blocks mutually support each other, so that the weight of the traffic is distributed over a considerable area, and the danger of a block here or there tilting or becoming loose, is almost entirely avoided. This distribution of the load also tends to preserve the blocks from destruction by the concussion and stresses to which they are subjected.

ALBION CLAY CO. LIMITED.

A notable exhibit in the road drainage section is that of the Albion Clay Co. Limited, of Burton-on-Trent. The Company are showing a representative selection of their specialities, most of which are very well known. Among these may be mentioned Syke's Patent Street Gully, which has several distinct advantages as compared with most other gullies. It is so constructed that the water descends and rises again over a diaphragm before it escapes, so that all road detritus is prevented from entering the sewer. It has an exceptionally deep seal and is very easily reached for cleansing. Electric conduits made with any number of ways and electric lamp boxes of a specially convenient kind are among other exhibits we noticed at this stand.

THE ROAD-BREAKING CO., LIMITED.

The Road-Breaking Co., Limited, of Broadway Chambers, Westminster, London, S.W., are exhibiting their special scarifier. This machine is quite separate from the roller operating it, and is attached to it by a suitable coupling, immediately behind and in the centre of it, ensuring uniformity of action and reducing to a minimum the jars and strains inseparable from this class of work. The machine works backwards and forwards with equal facility, no turning of the roller being necessitated even in the narrowest of roads. Another of the Road-Breaking Company's scarifiers, Hosack's Patent, has been designed to meet the requirements of engineers and surveyors who prefer the road scarifier to form part of the engine. Its action may be best explained by stating that by turning either of the hand wheels the worm is caused to revolve in the worm quadrant, and thus the tools are easily adjusted to the required depth for the work in either direction.

WORSHIPFUL COMPANY of CARPENTERS.  
THE ANNUAL EXAMINATION IN CARPENTRY AND JOINERY  
will be held at Carpenters' Hall, London Wall, on JUNE 14th, 15th, 16th, and 17th. Certificates and Medals are awarded to successful candidates.  
Free Lectures to candidates and others will be given on the subjects at the Hall on THURSDAYS, 4th, 11th, 18th, and 25th MAY, and 1st JUNE, at 7.30 p.m. The first lecture will be by F. R. FARROW, F.R.I.B.A., on "Strength and Strains in Wood."  
For full particulars and list of lectures, apply to S. W. PRESTON, Esq., at the Hall.

SANITARY INSPECTORS' EXAMINATIONS.—An Associate of the Sanitary Institute thoroughly PREPARES CANDIDATES for the above Exams. by correspondence; no books are required.—For particulars and testimonials apply, "Certified Coach," 31, Herbert-road, Plumstead, S.E.

ANSELL and MALLOWS, Architectural Draughtsmen and Quantity Surveyors, 21, Buckingham-street, Strand, W.C.

R. I. B. A. EXAMS. PREPARATION, personally or by correspondence, in three, six, nine, or twelve months' courses. Architectural Lending Library. Special three months' finishing courses.—For full particulars apply to Messrs. HOWGATE and BOND, Associates R.I.B.A., Perchard House, 70, Gower-street, W.C. (close to the British Museum)

CIVIL SERVICE COMMISSION.—Admiralty Assistant Surveyors and Assistant Civil Engineers. First places at both Examinations in March.—MIDDLETON and CARDEN, 19, Craven-st., W.C.

MASON'S CHISEL, STEEL,  $\frac{1}{2}$  to  $1\frac{1}{8}$  octagon, 12s. to 16s. per cwt.; Chisels, 6d. lb.; Best Cast Steel for Lettering Tools, &c., from  $\frac{1}{4}$  d. lb.—E. DEALEY, Moore-street, Sheffield.

APPOINTMENTS VACANT.

The charge for Advertisements under this heading is 1s. 6d. per insertion not exceeding four lines, and 6d. per line afterwards, prepaid. Three insertions may be had for the price of two.

WANTED in an Architect's Office in Westminster, PUPIL. No premium required.—Address Box 549, care of Brown's, 17, Tothill-street, Westminster.

ARCHITECT'S JUNIOR ASSISTANT REQUIRED at once. Apply, stating qualifications and terms, to JAMES R. WIGFULL, 14, Parade Chambers, Sheffield.

A VACANCY has occurred in an old-established Brighton Architect's office for a PREMIUM PUPIL. Good opening for a smart youth.—Apply "C. A. S.," BUILDERS' JOURNAL Office.

APPOINTMENTS WANTED.

YOUNG ARCHITECT, A.R.I.B.A., ASSISTS in the PREPARATION OF DRAWINGS, TRACINGS, &c., at his own Office. G. SCOREB, 28, Newman-street, W.

QUANTITIES prepared, specifications written, works measured, and variations adjusted by reliable London Surveyor. Over twenty years' experience. Special terms by arrangement.—"Surveyor," office of the BUILDERS' JOURNAL.

MANAGER or GENERAL FOREMAN seeks RE-ENGAGEMENT. Thoroughly practical. Used to taking entire charge of factories or large jobs. Twenty-five years' experience. Good references.—Address "D. R.," 2, Grove-lane, Hackney, N.E.

SURVEYOR'S GENERAL ASSISTANT REQUIRES RE-ENGAGEMENT to work under principal in taking off, working up, and outside measuring; good references; moderate salary; southern counties preferred; commence at once.—Box 1051, BUILDERS' JOURNAL Office.

PERSPECTIVES. E. BECKITT LAMB, 31, Craven-street, Strand, W.C.

TRACINGS. MISS GADSBY, 6, Wine Office-court, Fleet-street, E.C.

ADVERTISER will be at liberty June 1st, requires POSITION as REPRESENTATIVE or GENERAL MANAGER of firm who manufactures building specialities, decorative line preferred; good draughtsman, designs, and used to Limited Companies' methods; moderate salary.—Box 1049, BUILDERS' JOURNAL.

ARCHITECT'S and SURVEYOR'S QUANTITIES PREPARED quickly and accurately on special terms. References.—ADAMS, 28, Eldon Chambers, 30, Fleet Street.

## An Architectural Causerie.

### "Making the Ugly."

THIS phrase will have vogue for a time; it seems to express a truth and it

answers well to current opinions as to the state of the arts at this moment. As Lord Salisbury intended it, we must understand that Art is losing always more and more of the sanction of antiquity and is therefore despaired of by Academicians and by all who have acquired their ideas from the jargon which is called art criticism. To give up the forms of beauty which were invented and were appropriate three hundred years ago, or three thousand, is like giving up an old creed; and, by all who still accept it, those who cannot are regarded as mere atheists, however sincere they may be in seeking for new light and a purer faith. The innovators in matters of art just now, having the example of a great victory before them, won by the "atheists" of the third century, may be excused if they do not adopt the despondency of Lord Salisbury, and if they even venture to see in the ugliness of some modern art a hopeful sign of new life and of beauty, to be one day developed. The embryo is rarely beautiful, but, if it contains the germ of a healthy organism, its natural forces moulding all assimilable matter that comes within their reach, will create a form which will have its own appropriate type and be recognised as beautiful or ugly, according as the force has acted freely on plastic matter, or with difficulty on more obdurate material. For ugliness is generally the result of force acting under impediments, as when a sculptor has no clear idea or purpose and he strikes ignorantly, or a builder is baffled by the incompatibility of the materials he is compelled to use. Ignorant force is always unavailing, and material which is master and not servant gets itself into meaningless and ugly forms. Ugliness, therefore, may be supposed to come from the lack of clear purpose and the want of underlying system. It is less likely to be found in the work of men who are steadily applying natural laws in their design than in that of another school which aims no higher than the adaptation of forms which have been good in their proper time and place. The ugliness of much modern work is of this last—barbaric kind; it is not, however, that referred to by Lord Salisbury. What he had in mind was rather the ugliness of the ironclad and the fort—if these essentially modern things may be called ugly:—the ugliness—equally questionable—of rudimentary design, unable as yet to attain its ideal.

The two kinds are essentially different and, according as we prefer one or the other—for our choice just now seems to lie only between kinds of ugliness—our art will either sink deeper and grow feebler or, it will clear itself from the tangle and obstruction with which the decayed and now useless art of former time has clogged it. It is worth while, then, to think a little about this second

when the authority of tradition was still great, a factory engine would have been set up with a framework of Doric columns, cast in iron, and cranks were shaped like legs with joints. Nobody had yet thought of finding the proper mechanical equivalents for stone pillars and human legs when the material became cast iron. Was machinery more beautiful in those days? We have

A COMPETITIVE DESIGN FOR ST. ANDREW'S CHURCH, AYR. JAMES A. MORRIS, ARCHITECT.

kind of ugliness, that which the artists who dined with Lord Salisbury are so nobly "struggling against." Let us see on what it depends—what it really is. In the first place it is the result of a daring disregard of consecrated forms. The connoisseur who looked always for his "brown tree," would have found ugliness plentiful to-day, and he also who abides by "five orders" and certain "periods" would never give his approval to buildings which are designed according to no laws but those of Nature. Fifty years ago,

come to think that when each part has its appropriate form studied firstly from the mechanical conditions, the machine is more shapely as it is certainly more rational. So designed it is, in the strictest sense natural, and pleases mind and eye, just as in a higher degree does some fine animal. Machinery is the black beast of every railer at modern ugliness. Well, it does not, nor ever will belong to the higher orders of beautiful things because of its limitations. It is an organism of low type. Let us go a step

higher. Is not a modern railway station in all respects better than those first ones which depended for ornamental character on certain "fixings" borrowed from the details of Greek or Gothic architecture? We may say of some of the smaller stations built recently that they are among the best and most hopeful beginnings of good architecture we know. The same causes have produced them which led to the reform of the machinery, only, the constituent material of the buildings being diverse, more variety was attainable by them in form and colour, and more scope was offered to the inventive faculty. These instances show us that the second and most valuable character of unconventional design is that it is governed strictly by natural laws. In this lies its strength and our hopefulness. We are glad, then, when Lord Salisbury tells us that the tendency of every change that is going on is towards this ugliness of the ironclad. We do not agree with him, however, when he says that "the whole current of modern thought is opposed to the beauty which appealed to the cultivators of art in earlier years." On the contrary we find that the two are strictly allied. In appealing to nature our designers must find themselves in sympathy with all the best work of antiquity. How far our laureated and fashionable art is removed from that of the great periods is abundantly shown by the applause which greeted Lord Salisbury's question—"What is constitutional government from the point of view of art?" What indeed is constitutional government and freedom to well-dressed people who think only of privilege? To the citizens of Siena in the thirteenth century it was something worth having—very precious indeed, and their artists knew how to express that. The noble picture by Lorenzetti in the Sala della Pace would be classed by the diners on Saturday as a very mediocre affair and "ugly," but in it was the possibility of the future greatness of Italian art. The other kind of art, that which doffs its cap to foolish patrons and does not dare to be true, to be ugly even, if that imperfection be the price to be paid for sincerity, is a declining art. Between the two the world has to choose if it would rather have life made beautiful than have many thousand academic pictures, and it behoves all true artists to see that the judges with whom the decision rests understand clearly the issue. It is, fundamentally, between freedom and authority. To authority the world naturally turns for guidance; it would save itself all trouble of thought, all responsibility of choice, and so it becomes the dupe of one imposter after another. In matters of art it is the tyranny of worn-out forms which checks spontaneity and creates artificiality. Let us never cease protesting. When we are asked if some new mode is "correct," let us say boldly yes, or explain that nothing is correct in art but what is based on natural laws, and that loyalty to those laws must always precede the consideration of beauty. But is not beauty the aim of art? Yes; surely, only it must be the beauty which grows naturally out of the work, as the beauty of a flower is the final expression of its purpose, not its original motive. While the artist sets himself thus resolutely to work; the perfect form, the ultimate expression of the thought which moulds or binds together brute matter to make of it a new organic body, may still be wanting, but he need not despair. If he does not arrive there are others coming after who will carry forward his work, and the final perfection will witness to a common feeling of reverence for law, for Nature and sincerity. It is thus that National Art is made. In its earlier stages it may be rude, ungainly; but, inspired by the right instinct, it will be the solid basis on which every ornament of grace and fancy may be set.

### Colonial Architecture at Earl's Court.

The Greater Britain Exhibition at Earl's Court is well done, and offers several interesting points for observation. Practically the main buildings remain as they were, with new decorations and some minor improvements. Quite new, however, is the charmingly arranged Egyptian street, with its public buildings surmounted by domes and minarets, its shops and cafés ornamented with handsome screens—marvellous specimens of cabinet work wherein minute pieces of hardwood are arranged in weirdly diversified geometrical patterns. Of course, the street has been constructed of timber framework, covered over with fibrous plaster. It affords a capital example of the fine, realistic effects obtainable with this material, which lends itself to all kinds of uses, is easily bent, takes the most elaborate moulded decorations, and looks as well if coloured as if left plain white. Its weathering properties, as proved out of doors here at Earl's Court, are extremely good. The old street of Picturesque England shows another use of this fibrous plaster in connection with timber and tiles. Well worthy of a visit is the Native African Village, with its collection of mud and willow wand huts—so closely allied to the wattle-and-daub primitive architecture of Devon. There are forty huts, circular in form, and with a diameter of 12ft. The natives did their own building. A wind pole is stuck in the ground, and a circular mound is formed at the requisite distance from it. Into this mud "footings" stout, supple willow wands are fixed, bent over, and fastened to the top of the centre pole. Then more willow branches are woven between the uprights, and the close lattice work is finally covered with a thick coating of mud. One section is left clear as a doorway. As a rule, the floor is merely trodden hard; at Earl's Court it is cemented, for sanitary reasons. It is interesting to know that plans and sectional drawings of these huts were submitted to, and solemnly passed by the London County Council. The lake has been considerably enlarged, its capacity has been increased from 1,372,380 gallons to 1,512,720 gallons. It takes over three weeks to fill the lake, which receives draining from surrounding paths and gardens. The lake was formerly entirely cemented, but to prevent leakage, part of the bottom and the sides have been asphalted. Towering above the lake is a light, and not altogether inelegant structure known as a Canadian water chute; a deck of hard wood with maple runners being supported on the series of diminishing trestles. Down this declivity canoe-loads of happy folks are to be shot onto the waters of the lake, the canoes being so constructed that as soon as they strike the water they rise and glide onwards. People and boats are to be hauled up the dizzy heights by cable power. The Empress Theatre has been rearranged; the arena measures 160ft. by 180ft. and will accommodate some 400 Africans and Europeans when they assemble in mimic battle. In the various sections occupied by Colonial Governments many things of value have been gathered. Mining and mining machinery are conspicuous; also precious ores and refined metals. Both Queensland and Victoria send large and valuable collections of timber. It is, perhaps, a pity that the pioneer side of Colonial life is not more strongly brought out. Models, or pictures, of huts and houses in every corner of our Empire would have been instructive. However, as it is the Earl's Court Show has its educational value, helping to familiarise the public with diversified forms of architecture and styles of decoration.

G. C. R.

## A "BUILDERS' JOURNAL" COMPETITION.

### DESIGNS FOR A COUNTRY HOUSE.

IN accordance with our announcements, we have arranged a competition, to be open to all our readers, for designs for a country house.

All intending competitors should read carefully the following details, which have been revised and amplified since the original announcement of the competition.

To avoid any possible misconception as to our object in publishing these revised conditions, it may be well to state that the original particulars were given to us by a relative of the client during the client's absence abroad. It was not until his return to England that we were able to obtain the fuller and more definite particulars which are here given. As a set-off against any possible inconvenience that may have been caused to any reader who may have set to work directly the first statement of conditions appeared, we have doubled the premiums originally offered, so that the premiums are now **Twenty Guineas, Ten Guineas, and Four Guineas.**

As the competition is intended to meet the requirements of an individual correspondent, we append a statement of his wishes and, in making the awards, preference will be given to designs which most nearly comply with the following requirements:—

"I want a house long and low, with a large square entrance hall, to be used as a comfortable sitting-room, a wide staircase, and a gallery going partly round hall, a dining-room and boudoir for a lady, about six bedrooms, and three servants' rooms, with comfortable offices, &c. I want something a little unusual, either dark stained wood and thatch, or old timbers and thatch, and all kinds of angles and windows."

The house is to be built on a level site on the crown of a bank overlooking a large garden which is surrounded by woods. The grounds in which the house is to be built cover an area of 6½ acres, and are situated in the neighbourhood of Hythe. The house will face N.W., but the main entrance is to be at the back, facing S. The drainage runs N.N.E. The house is to be long and narrow; the roof may be thatch or tiles, but not slate; large eaves are desired. In addition to the requirements given above as to the rooms, it is desired that there should be a small study and two bathrooms—one in connection with the best bedroom. No stable is required. The cost of the house should be from £1,500 to £2,000.

Any intending competitor wishing to view the site can obtain the exact address by communicating with the Editor.

Premiums will be awarded for the three best designs, viz.:—

First Premium	...	£21 0 0
Second Premium	...	10 10 0
Third Premium	...	4 4 0

The services of a well-known architect will be secured to act as assessor. The three premiated designs will be forwarded to our correspondent, who may commission the carrying out of one of them; but it must be understood that our responsibility in the matter ends with the payment of the premiums.

The designs submitted may include a perspective view, as well as plans and elevations, and must be accompanied by a brief specification (that is to say, a description of the house and the materials proposed to be used). They may be drawn to any convenient scale, but must be inked in and be without colour or wash.

Drawings must be despatched so as to reach the Editor of the BUILDERS' JOURNAL not later than May 24th; they must be submitted under a motto, accompanied by the name and address of the competitor, in a sealed envelope.

The drawings will remain the property of their authors, but we reserve the right to reproduce any we think fit.

JAMES A. MORRIS, F.R.I.B.A.

## Men Who Build.

No. 56.

JAMES A. MORRIS, F.R.I.B.A.

**E**MULATING in a manner a prominent characteristic of the subject of our present notice—that of coming to the point, we may at once mention that Mr. James A. Morris is a man whose pronounced personality at once arrests the attention of all who are privileged to come into contact with him. No man, they say, is truly great to his valet, and whether by parity of reasoning, an extended opportunity of seeing Mr. Morris in many phases of his work should in any way militate against an impartial appreciation of that work, we leave the reader to determine.

The illustrations shown here are only such as have readily lent themselves to reproduction, but they may none the less in a manner indicate the versatility of Mr. Morris's practice.

The Spaniards have a proverb, "It is only your friend who can betray you," but any betrayal of the process of Mr. Morris's success would simply divulge the trite secret of *all* success, industry united to patience, tempered by a singleness of purpose and lucidity of ideal.

In a lecture lately given to the Glasgow Architectural Association, of which, by the way, he is honorary president, Mr. Morris, quoting Corot, said: "Truth is the first thing in Art, and the second, and the third." Then he resumed: "If a man knows or cares nothing for this spirit in Art, this ideal, then is the man no true artist, and if he has this spirit, let it be ever so feeble a spark, and does not submit to it, and walk up to it, then is he no true man." This intensity of *morale*, coupled with an indefatigable perseverance, is the whole process, then, of Mr. Morris's success.

Architecture has been not inaptly described as frozen music; thinking in the same conceit, we might translate some of Mr. Morris's work in phrases of the stately pavan, the delicate, dainty minuet, or the brief staccato movement of the coranto. In short, his work, especially his domestic architecture, has a delicate, indescribable charm, in fact, all the quaint quintessence of older numbers. Not the mere transcription of old ideas in the uncouth fitment of modern garb, but rather the deft adaptation of an artistic imagination, and a well stored mind to the absolute utility of modern times.

Patience is genius! there are architects and architects, and the prime factor in the resolution of individuality from the dense current of

commonplaceness is undoubtedly—imagination; but, mere invention will not of itself suffice to bring an artistic harvest to a golden fruition, for, unless the man has industry, the capacity for mastering details, for assimilating the minutiae of his craft, he will never be a great architect, if he even become a successful one. The faculty of rendering details interesting is strongly evinced in Mr. Morris's work, and this may be explained by the fact, that he always tries not only to make them look well, but also to feel pleasant and restful to the touch of the hand; for just as one may close one's eyes when listening to music and hear better thereby, so with mouldings one may feel them rhythmic to the touch as well as to the eye, and learn from two senses rather than from one alone.

If it be possible, that, to the mind of the architectural pedant for a man to be an artist, to have the potent gift of imagination, is to be a criminal, then, we fear Mr. Morris is extremely guilty, and when we consider that it is generally taken for granted that the function of an architect is "to build," and when we know that the different decorative crafts are in a manner left to the freedom of their own will, we must be grateful for every instance that establishes a precedent to the contrary.

Even in these latter days of paramount science when the tendency is to relegate things to the materialistic level of a mathematical equation (as if music were a mere matter of rhythm and ratio, and Architecture an affair of strains and stresses), no one would certainly deprecate an essential regard for the science of construction; but one result of the trend of this mechanical tendency is the introduction of incongruous decoration. The intensity, in fact, of modern competition produces by a natural evolution eccentricity instead of beauty.

An examination of Mr. Morris's work reveals a harmonious unity between building and details, and in his domestic work especially, we find the same scholarly selection, artistic taste, and acute discrimination, from the quaint "tiring pin" on the front door to the naïve set of the chimney pots, while in his larger work, simple forms and strong dominant lines and masses are its prevailing characteristics.

Mr. Morris practised for many years in London, and while there acquired or developed much of that spirit of originality, that recusance of the mere convention, which has since distinguished the work of some of our "newer" men. This element of "newness" Mr. Morris has deftly wrought into the texture of his own invention, and he has given us a local taste graced with the robustness of a large community. Though his work in Scotland was at one time distinguished by the scoff of the uncultured general, and the praise of the enlightened few, it is much to be able to say that his earlier work which, from its

striking originality, was almost certain to meet with such a fate, has now redeemed its welcome, has justified its existence, and to an extent is now a standard by which contemporaries measure the limit of their courage. In short the "fools who came to scoff" have now remained to admire, and where formerly local architecture could only be described as commonplace, uninteresting and tersely bald, we now find the trend has been along the lines initiated by Mr. Morris many years ago.

It is hardly necessary to distinguish between mere artistic facility and the science of architecture. We know that many a man who, by lissom fingers and subtle eye, can inscribe for you an exquisite "note," can no more build a house for you than fly; that in fact the art of sketching, or if you will even, inventing, graceful bits does not of itself constitute an architect. Yet we cannot think that any of Mr. Morris's exquisite "bits," quaint corners, and artistic "notes" have ever been gained at the expense of construction, and it is really remarkable how, as in the case of his own residence, every nook and corner has been utilised and beautified.

Of the examples of Mr. Morris's work shown here one which will eventually be not the least interesting is the Pergola, of which parts are illustrated in our inset plate. This Pergola is about 100ft. long, 8ft. wide, and 7ft. high. It is built of teak, oiled, and forms a long alley across the middle of a high walled garden. It is entered from a wide lawn, shaded with chestnut trees, and is placed axially with the arched opening in the ivy-covered wall between these gardens. At either end of the Pergola are tall circular piers of red rubber brick, against which the teak framework of the Pergola abuts. At its further end, and separated from it by the width of a footpath, thereby gaining a space for strong light between, is an apse of yew, against the dark green of which the semicircular bed of tulips or brightly-coloured flowers, seen at the end of the long dim turf-floored vista, gleams like a jewel. Midway in the Pergola's length, and on either side of it are semicircular spaces to be curtained like the long alley on sides and roof, by roses and wistaria, clematis and honeysuckle, climbing plants of many hues, and bright green creepers; so that the side chambers may, by-and-bye, form cool places of retreat, and yield also an unbroken length to the Pergola alley.

According to Lombroso, talent—genius, if you will—is endemic; and, doubtless, success is often dependent more upon circumstance than the mere textual arrangement of the "grey matter." In Glasgow, the new School of Painting has been locally dignified by the title the School of Progress and Poverty, and it might be a question how far success might be impelled by a chronic condition of "hard-upness."

However, all that not merely by the way, but partly to suggest the fact that in a

AYR WORKING MEN'S UNIONIST CLUB. JAMES A. MORRIS, ARCHITECT.

provincial area, such as that in which Mr. Morris' practice has principally rested, method, style, material, local features and details, are, to an extent, tradition. In such an area, the "family" idea of the mediæval craftsman is to an extent unconsciously emulated and the architect is in closer touch with the builder and other craftsmen than is possible in larger towns.

"Touch" might not be the right word. "Sympathy" one should say; be this as it may, it is hardly too much to say that Mr. Morris' dainty creations, full of delicacy, polish, education, precision, largeness and yet simplicity, could never have been done without that essential intimacy between heart and hand: the innate excellence of architecture welded to the no less valuable excellence of good workmanship.

## HOUSING OF THE LABOURING CLASSES.\*

By P. FYFE.

(Continued from page 189, No. cxxi.)

OF the second class a few words are necessary, because they are a recent growth in Glasgow, creatures of sad circumstances, often of their own making, but nevertheless inexpressibly sad. When, through the death of the breadwinner, or his prolonged illness, or failing health, or loss of steady employment, or, as often happens, through the drunken

\* A paper read before the Glasgow Architectural Society.

habits of one of the domestic partners, the scanty furniture melts away into the pawnshop, the family stand on the very verge of poverty. They cannot get a house—they have little or nothing to put into it, and consequently they fall into the hands of the house-farmer, who is the small capitalist of this unfortunate class, and who demands full—very full—profits for his accommodation. A hasty survey in the city recently revealed the existence of 366 separate houses of this class, lodging 1680 of these, the poorest of the poor.

### Victims of the House Farmer.

What is going on is as follows: A house-farmer rents a whole building from the owners at rents averaging about 7s. 6d. a month per single apartment, and puts in each compartment a bed, bedding, grate, fender, kettle, pots, a frying-pan, a table, two chairs, cups and saucers, plates, knives and forks, spoons, oil-lamp, a jug, a pail, a basin, a scrubbing-brush, a shovel, and a few other odds and ends. Several inventories have been taken of such furnishings, and a liberal estimate of their total value would be 40s. per set. These furnished apartments are let to the sub-tenants at 5s. per week on the average, paid in advance. Now, I am going to assume that the farmer requires to refurnish each such house every six months, which would cost him 80s. per annum; this added to his average yearly rent for it would bring his yearly expenditure up to 170s. per room. For this he draws at the rate of 260s. per annum, which returns him 53 per cent. on his outlay. If this be not usury, levied on the poorest and most unfortunate of our free population, I don't know what it could be called. Of course, it is admittedly a risky business, requiring constant personal oversight to prevent destruction and moonlight fittings in many cases, yet, withal, it involves these people in a mesh out of which, once caught, they can hardly hope ever to escape, and completely bars the way to their possessing again, without benevolent help, the means to furnish a home of their own. We now come to

### The Main Question.

viz., can sanitary dwellings for the labouring classes be erected and rented to them at a tenth part or thereby of their total earnings without involving the undertakers in financial loss? To answer this question we must not theorise, but take such experiences as are afforded us from well-known blocks of such houses existing in the city. I have accordingly selected nine blocks of tenements belonging to three classes of owners, viz., three belonging to the Corporation, three belonging to the Glasgow Workmen's Dwellings Company, and three belonging to private proprietors. These it will be convenient to number 1, 2, and 3 for the first; 4, 5, 6, for the second; and 7, 8, and 9 for the third. In order to solve the problem and keep in constant touch with the labourer's wage I have reduced everything to the level of a weekly rent, and, further, for purposes of strict scientific comparison, I have abandoned the varying unit of the house, and have taken in every case the unit of 1000 cubic feet free air-space in each house, which, as you know, is the legal minimum allowed for all houses to be built after 1892. A house for the labouring and poor classes may mean anything from 1000 to 2000 cubic feet of space, and as air-space to dwell in is the all-important thing for the labourer and his family, it is on this basis my inquiry rests. It will become obvious as we proceed that what are the facts about 1000 cubic feet of house-room are the identical facts about the whole house, about every house in the various blocks, and also about the whole block of houses dealt with. It becomes in each case simply a matter of multiplication by the number of available cubic feet in any part or in the whole, and by the number of weeks in a year to arrive at the exact sum paid or due under each heading.

### Conditions to Avoid Loss.

It will be plain to all that to buy or build house property, and rent it to tenants so that no immediate loss will result, four main conditions must be met. Provision must be made

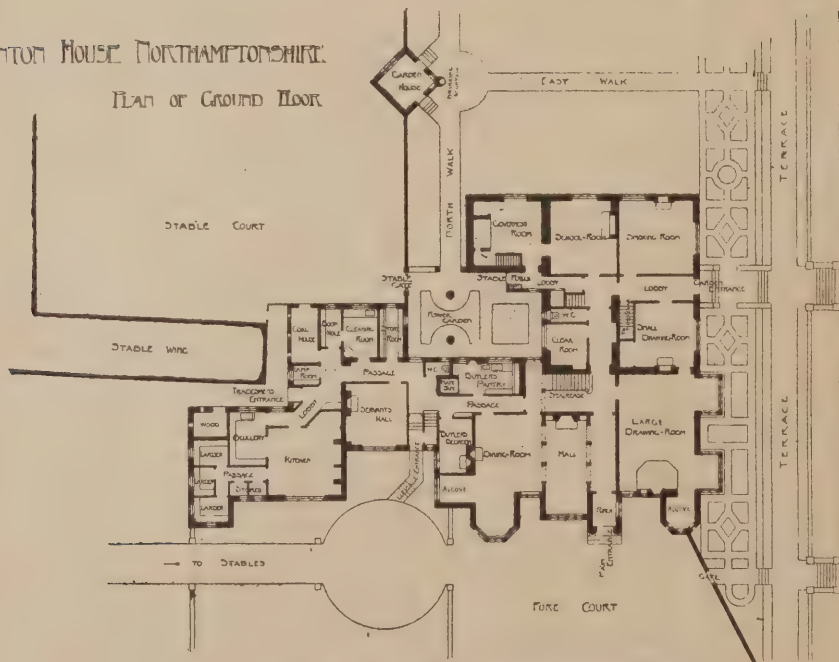

ENTRANCE FRONT.

PERGOLA IN CARRICK HOUSE GARDENS, Ayr.  
JAMES A. MORRIS, ARCHITECT.

for meeting (1) the ground rent; (2) the interest on cost of building; (3) the outlays for management, owners' taxes, and fire insurance; and (4) for actual repairs on the property. Anything which is left over after discharging these obligations may be used to meet future loss due to property depreciation, which may be called a sinking fund, a redemption fund, a reserve fund, or other suitable name, and what thereafter remains may be justly deemed available as profit or surplus over and above the bare interest a corporation, or society, or individual has to pay the capitalist for borrowed money. It is evident at the threshold of the inquiry that we must fix two things, viz., our standard of ground rent, and our standard of bare interest on building capital. It matters little what standard we adopt, as additions or deductions per 1000 cubic feet per week can easily be made from any given basis; but for purposes of exact comparison these two must be laid down on parallel lines.

#### Ground Rent.

Now first as to ground rent, I have taken each site as costing 30s. per square yard, and the ground burden or rent to be covered by rents chargeable on the tenants at 3 per cent. on the cost of the total site at the above rate. Building rent or the bare interest on the total cost of the building is put at 2½ per cent., because the City Registrar informs me that the Corporation can borrow all it needs at this rate. The cost of the respective buildings themselves represents the exact sums paid for them, and in the case of those mentioned in the tables belonging to private proprietors, the very liberal valuation has been put on them, all being old buildings, of 4d. per cubic foot over all outside measurement. It will probably be of considerable interest to property valuers to know that in developing these calculations I find that in such old properties, containing one and two apartment dwellings, the available cubic space for living purposes comes out at between 52 and 53 per cent. of the total over all cubic measurement. That is to say, for every 1000 cubic feet of free air-space a labourer gets to live in, 1923 cubic feet are absorbed in building from the ground level to the ridge of the roof.

#### Some Comparisons.

With these explanations we can now examine the properties selected and compare results. Let us take first Nos. 1, 2, 3, belonging to the Corporation. No. 1 contains forty-eight houses of one apartment and twelve houses of two apartments, is a four-flatted block on the balcony system, and is built of brick. Here the two apartment tenant pays as rent per week for each 1000 cubic feet, 14½d. (Please recollect that all rents now to be spoken of do not include Police-rates, School Board rates, nor Poor-rates, but do include payment for water and stair gas light). Each one-apartment tenant pays as rent for similar space 14s. 4d. 4pence per week, or nearly 14½d. Splitting these weekly rents up, we find the one apartment weekly rent per 1000 cubic feet charged

with the following, viz.: for ground rent, 2s. 2175d.; for interest on building, 7s. 15d.; for management, owners' taxes, and insurance, 2s. 706d.; and for actual repairs, 1s. 208d., leaving a surplus over 2½ per cent. on buildings of 1s. 225. Similarly the figures for the two apartment rents per 1000 cubic feet per week are respectively 2s. 27d., 7s. 296d., 2s. 752d., and 1s. 236d., leaving as surplus, 1s. 186d. per week. Now these conjoined weekly surpluses per 1000 cubic feet per week, multiplied by the total cubic feet in the two classes of houses, and by fifty-two weeks, amount together to £29 12s. 9d., or nearly ½ per cent. on the building cost, and together with the bare 2½ per cent. interest, to nearly 3½ per cent., or exactly £3 8s. 10d. Therefore, here at the very entry of our inquiry, we have a block of buildings which almost meets what we are looking for, viz.,

#### A Self-Sustaining Labourers' Property,

rented within the labourer's means. It may fairly be said that ½ per cent. is not enough to meet contingencies and depreciation, nor is it, even with a Corporation financing, but, on the other hand, it must be taken into account that the cost of these buildings was £6,738 9s. 4d., or 6d. per cubic foot over all measurement. Here I join hands with the Committee of the London County Council in deprecating such high standards of construction and material. Government and municipal standards are in the main good and desirable, but infinitely more important and useful for the poor labourer are good accommodation and low rents, and, in my opinion, where the former makes the latter impossible, elasticity must be found in construction, as there is none in the poor man's ability to pay. Here is the point where the architectural craftsman comes in—where his special knowledge and skill may be employed with the greatest usefulness to his poorer fellow citizens. The question of the greatest urgency is, cannot a large block of labourers' dwellings of four or five flats be properly erected and completed for less than 6d. per cubic foot measuring over all? I think it can. Mr. Robert Scott, the well-known measurer, has certified that the four stone-built four-story tenements belonging to the Corporation in Osborne Street and King Street were erected and completed in all respects for 4½d. per cubic foot; that four similar tenements fronting King Street and Parnie Street, with basements 7ft. high, were left finished for 4½d. per cubic foot; and that six tenements of the same construction fronting Parnie Street and circling into Osborne Street cost to complete them the same—viz., 4½d.

If this be so, then you will be able to say whether brick-built labourers' dwellings should cost more or less.

#### Cost of Building.

But I am now going to assume that a building identical with No. 1 belonging to the Corporation can be finished in every respect and left ready for occupancy for the same sum—viz., 4½d. per cubic foot, and ascertain, in that event, what the new surplus over 2½ per cent. will be. At 4½d. the cost of this building would be £5,053 17s. 1d., in place of £6,738 9s. 4d., which it actually cost, and the interest at 2½ per cent. £138 19s. 7d., instead of £185 16s. 3d. This would allow of a surplus of £75 19s. 5d., or £46 6s. 8d. more than the actual surplus, or £1 6s. 1d. per cent. for reserve, instead of 8s. 10d. per cent. now available. This one example, therefore, proves that with ground at 30s. per square yard charged with 3 per cent. interest, and a four-story block built thereon at the rate of 4½d. per cubic foot, the poorest labourer may have a sanitary and comfortable house on the balcony system for 14½d. per 1000 cubic feet per week, and yield £4 1s. 1d. per cent. of interest on the cost of the building. Should the labourer require that the size of his dwelling be 2000 cubic feet, he would have to pay 2s. 5½d. weekly for it, or fully 9½ per cent. on the average wage of £1 6s. 5½d., and 12 per cent. on the lower average wage of £1 0s. 6½d. Such a house would legally accommodate three adults and four children under ten years. I look upon this No. 1 property as the best in this city for the labouring man, and think it reflects on our Corporation the very highest credit. I have gone so minutely into the figures here that it will be, I imagine, unnecessary to cover the same extent of ground with each of the others. I shall therefore deal with them more generally.

#### Other Block Dwellings.

No. 2 consists of a block of thirty-six single-apartment houses in the very centre of the city. The weekly rent for the 1000 cubic feet here is more than in No. 1, being 18s. 14pence. The increase is due to two causes, viz., ground rent, and surplus over 2½ per cent. on building. The total interest yielded here is 4½ per cent., but the rents are more than the 10 per cent. of earnings desiderated, as each house contains 1832 cubic feet, and hence demands a weekly payment of 2s. 9½d. Block No. 3 is a small property in the Calton district containing fifteen houses of each class on the balcony system. Here the two-roomed tenant pays

INGLE NOOK: BILLIARD ROOM, RED HOUSE, Ayr. JAMES A. MORRIS, ARCHITECT.

18-520d. per 1000 feet per week, or 3½d. more than the tenant in No. 1 block, and without countervailing advantage so far as I can see; while his one-apartment neighbour pays 2½d. less, or 16-339d. The tenants pay more than those in Block No. 1 on every item, excepting for interest on building, and the surpluses over 2½ per cent. are 3-127d. and 2-769d. per 1000 cubic feet per week respectively, thus leaving the total interest on building cost at £4 1s. 5d.

#### An Interesting Experiment.

We now come to a consideration of the blocks of the Glasgow Workmen's Dwellings Company. Here we have two blocks of five-storey buildings with a fine concreted court between them 62ft. in width. The walls are of brick, built hollow and rough cast with cement outside. The two blocks contain eight single-roomed houses and forty-eight two-roomed houses. There is also one three-apartment house occupied free of rent by a resident caretaker, who is a joiner working on the property, and a suite of rooms or recreation hall rented from the Company by the Toynbee Association. There is a difficulty in dealing with these blocks in a comparative way because of these exceptional extras, but in the following figures I have eliminated from the calculations any rentals derivable from the caretaker's house and from the recreation halls, and have tried to ascertain how far the tenants of the fifty-six dwelling-houses could pay for everything, and, if so, what extra surplus would be left over to be added to the £110 per annum the Company receive for the halls from the Toynbee Association. Under this method we find that the forty-eight two-apartment tenants who pay 18-605 pence per 1000ft. per week, and the eight single-apartment tenants, who pay 17-068 pence, can clear off all charges, and leave per 1000 cubic feet per week '688 pence and '607 pence respectively. Multiplying these figures by the total cubic feet in each class, and by fifty-two weeks, leaves a surplus over 2½ per cent. of £14 8s. Had the recreation halls been built as extra one-apartment houses, the rental would have been exactly the £110 which the Toynbee Association are paying for them, so that it is quite fair that this £110 should be added to the £14 8s. to arrive at the true surplus profit. This, then, yields the company a surplus over the 2½ per cent. of £124 8s., which is equal to an additional £1 17s. 4d. per cent., or £4 12s. 4d. per cent. as total interest on the cost of the buildings. But this, favourable as it is, fails to give a correct comparative figure, as we should take into account a special system of renting inaugurated by this company—viz., that of allowing all good, steady, permanent tenants a biannual deduction of two week's rent at Glasgow Fair and at the New Year holidays. Assuming that all the tenants received this bonus, the total surplus would be £154 9s. 6d., instead of £124 8s., or £5 1s. 4d. per cent. of a total interest on cost of buildings in place of £4 12s. 4d.

#### Conclusion.

From our study of these new properties I think I am now justified in saying that in Glasgow the Corporation can erect new dwellings on 30s. ground for the poorest, and rent them on a ten per cent. average earnings basis, not only without loss, but with a small profit, as by employing a jobbing caretaker, and keeping the property in good repair, 1 per cent. is sufficient for the sinking fund. It seems clear that, except in a few new buildings, the rent-paying capacity of the poor is not so much considered as the question—What are the rents for similar houses in the neighbourhood? The law of supply and demand in old properties has free play, but this is not fair play to the poor, because neither builders nor property owners are building houses of this small class, and consequently the demand is o'er-topping the supply. The result of this is only too evident in the very high rents charged. If a study of these figures and suggestions will eventually lead to the building of sanitary dwellings for the poor by the Corporation, or by such Associations as the Glasgow Workmen's Dwellings Company, my labour will have met with a full reward.

## DELLA ROBBIÀ POTTERY.

IN our issue for April 12th we reported two papers on "The Application of Colour to Interior Ornament in Relief," read before the Royal Institute of British Architects on April 10th. In the discussion which followed Mr. Harold Rathbone, of the Della Robbia Pottery (Birkenhead), made some remarks which will probably be read with interest.

Mr. Rathbone said there was nothing more objectionable than the large masses of glazed coloured tilings, with a perfectly flat surface, though it seemed necessary now to get some material which would defy the dirt and smoke and retain its colour-quality and brilliance. The machine-made tilings of the chief manufacturers of the day were intolerable; and in order to make others with an interesting surface and broken colour, the promise of support from the architects was an absolute essential. Permanency in material was also a necessity. It amounted to an insult (or at all events a vulgarity) to put a noble and historic design into a material such as coloured plaster, which was absolutely certain to suffer from the effects of time, although the surface of this material, so long as it lasted, and the variety and softness of colour which could be obtained, made it among the most attractive of all decorative settings for more temporary purposes.

Very fine effects might be secured by the utilisation of simple material in combination with richer material—such, for instance, as large surfaces of Candy's glazed ivory bricks which were made in Devonshire, Van Stratten's green tiles, other tiles which were being made by Conrad Dressler at Medmenham modelled on those used at the Alhambra, bands of plain colour, such as De Morgan's peacock-green tiles now supply, with accents and settings carried out in low relief work, or, if circumstances demand it, modelled in high and rich relief, with coloured grounds rendered in a permanent medium, after the manner of the works of the Della Robbia family made in the fifteenth century, on whose model his firm were endeavouring to work their factory at Birkenhead. All these methods were much more suited to this climate than marble, which so soon gets discoloured. Such glazed work, used in discreet conjunction with brick, produced in architecture the same delightful sensation which was felt in a lesser degree from the shine and shimmer of porcelain and glass on a material of a different nature, such as the every-day white table-cloth.

This difference in texture, and the variety of charming architectural effects of colour and quality, could be obtained by adapting materials of even the same colouring but different textures, such as enamelled terracotta used in conjunction with ordinary red brick. Very beautiful permanent effects could also be produced by the use of mosaic, such as Rust's, amid a green or white tiling introduced as panels in a wall, with accents of rich modelled and glazed ware, telling as jewels of colour within these limits.

Adopting this attitude, with the condition that the decorative settings of glazed ware thus introduced yielded the right perspective of architectural, or one might even term it orchestral, effect required for the building in question, depending mainly on the creamy or light silhouetted outlines and masses against the simple coloured grounds; or, on the other hand, adopting the method of clearly mosaiced or patterned colour, there was little limit to the discriminative uses which the Della Robbian treatment, with colouring sympathetically adapted to our less sunny climate, could serve. The designs of leading sculptors working hand in hand with the architects, or simply the architects' own designs or suggestions, could be carefully and wisely interpreted to suit the potter's art, so as to insure the effect demanded by the architectural conditions. As an instance of this he might be pardoned for citing Mr. Colcutt's construction for the fountain in the courtyard of the Savoy Hotel, for which his pottery had supplied the ornamental treatment and

colouring in glazed material, with a use of mosaic in the basin. Nothing more telling could be used in this temperate sense for wall fountains in the street or restaurant, reredoses, friezes, dado bands of colour, mantelpieces, memorial tablets, tympani for internal or external purposes, &c.; and it had been his pleasure to carry out work on these lines and for each of the objects enumerated.

This was an art which positively had not yet been seriously begun in this country, though the effects to be obtained were rich and delightful, and sufficiently economical in comparison with other methods. The work of the Della Robbias was as fresh to-day as it was when it emerged from the oven 400 years ago; but out of many specimens of coloured plaster he (the speaker) had seen, the colour had sunk in and deteriorated sadly within the last ten years. If glazed ware were made use of in a constructive manner, it ought to be of the simplest nature, and in the main undecorated. The examples of modelled ware taken from moulds and dipped into coloured glaze led to the insinuation among them of a machine-made art which must needs be highly distasteful to their artistic sense for its treacherous quality over monotonous flat surface, but if the simple material made large use of had an interesting and broken surface leading to a pleasant play of light, the effects of Venetian-like colour which could be got by judiciously introduced settings were infinite and delightful.

## Enquiries Answered.

*The services of a large staff of experts, including all those engaged on "Specification," are at the disposal of readers who require information on architectural, constructional, or legal matters. Questions should in all cases be addressed to the Editor.*

### THE COMPETITION FOR A COUNTRY HOUSE.

To the Editor of THE BUILDERS' JOURNAL.

BRADFORD.

DEAR SIR,—If I am in order in asking questions about the above, I should be pleased if you will answer the following, viz.:

1. Will filling in the walls solid with Indian ink be considered as a wash, or should they be left open?
2. Is it in compliance with the rules to send in a perspective done in sepia ink?
3. Should the drawings be mounted on stretchers or boards or not?

W. B.

The walls may be filled in solid, but all the drawings, including the perspectives, must be in line, without any wash or colour. The object of this regulation is that the drawings sent in may be in a form suitable for direct reproduction in our pages. Each competitor may suit his own convenience with regard to the mounting of the drawings.

### RIGHTS OF WATER COMPANIES.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—Am I unduly troubling you in asking your opinion of the following? The Waterworks Company in my town, in giving a direct supply (without meter) insist upon their own fittings being put in, some of which are hopelessly out of date. If you want fittings of an improved type, you must take your water through a low-pressure meter, into a supply cistern with ball valve—in my eyes, an unwholesome abomination. They can, and have, fixed high-pressure meters with direct supply to some premises, but such privilege apparently goes by favour. Can anybody legally demand a direct supply by high-pressure meter?—Yours, &c., G. W.

The answer to this query depends upon the statute under which the Waterworks Company is constituted, and the bye-laws, if any, made thereunder. If you will give information on these points a satisfactory answer can no doubt be given.

## SPECIFICATIONS.

(Continued from page 191, No. cxxvi.)

HERE is another way to shorten a specification. Take, for example, the windows to a building, one or two of which are dissimilar from the rest. I would first describe those, and then refer to all the others on all floors, in all positions, in the one item, and not describe them to each floor separately. Take, again, the external facings to brickwork. Describe any special facing first, and then the whole of the other facings to all parts of the one item without reference to special position. There are many other items which may be treated in this manner. One more suggestion. The wording itself of a specification may be much curtailed by care and practice. You will never be able to write concisely and to the point until you have written many specifications.

Do not labour the wording needlessly nor repeat yourself unnecessarily. In time the requisite language will come simply and quickly.

I want it to be understood that my remarks chiefly apply to the correct form and wording of a specification of which quantities do not form a part of the contract, or perhaps have not even been supplied.

## Tabulation.

Another important point in a specification is that it should be readily understood and clear. To avoid confusion, tabulate as much as possible the various parts of a complete item of work by placing each separate particular under the preceding one. It will take more paper, but then that is always a good fault, for it will make the description clear at a glance. The form of tabulation I would suggest is as follows, which illustrates the description of a roof formed with trusses.

The roof to be formed of, say, six whole trusses and two half trusses, each to be placed 10ft. apart, and composed of the following cantlings, and the whole notched, framed, spiked, and strapped together:—

Tie beams 12in. by 6in., resting on 2ft. 6in. joists 12in. by 3in. tooled York templates.

King posts out of 6in. by 5in.

Principal rafters... 6in. by 4in.

Struts ... 4½in. by 4in.

and so on. Here it will be noticed that each separate component part of the roof is placed immediately under the preceding one until all the items have been described. Thus, at a moment, the sizes and particulars of any one special part of the roof may be seen.

This form of tabulation will be found much clearer than the method which is so often adopted of running on the particulars of the various items line after line without a break. In the same way may be tabulated the descriptions of floors, windows, doors, and many other distinct items severally composed of many parts.

As another aid to the clearness of a specification, divide the descriptions into many clauses, and do not make the clauses too long, nor omit an occasional full stop. Also keep the clauses well apart, and do not crowd them together; any item will then be quickly seen, and you will not have to question to which part of the building a description belongs.

## Trade Headings.

Conceding this point that a specification should be perfectly clear at a glance, a further question arises: Should the work be divided into separate trade headings? As a general principle this is unavoidable, and I think desirable, but I would also say, without hesitation, that very many distinct items of work would be clearer and more comprehensible if the various trades relating to them were not separated, but the complete item of work described under the one heading, placed in whichever part of the specification seemed most desirable. Thus, to illustrate:—

Take an iron casement window, with wood

frame, linings, and the usual glass and fittings. Ordinarily this would come under several trades; but I would describe everything connected with that window under the one heading of, say, joiner—that is, the iron casement, the wood frame, linings, shutters, and finishings, the ironmongery, and glass, with, perhaps, a cross reference in smith, stating that the iron casements are described in joiner. The builder will see at a glance all the requirements of that window, and the client, if he peruse the specification, will also have an idea how it will look when finished. Another example: Take an iron girder. I would describe under smith and founder the girder itself, the templates, cover stone, any cement packing, felt or lead seating, and the painting. Perhaps it might be better to generalise the painting under painter in the one description applicable to all girders and covered up ironwork, and in that case a reference should be put under smith and founder. There will then be no excuse for the painting to this work escaping the builder's attention.

When describing the work to small alterations, repairs, or decorations, it is almost essential to adopt the order of running on the description, regardless of trade headings and formalities. Of course, when work is let to separate tradesmen you cannot adopt this method.

## Conditions of Contract.

A building contract, which is often referred to in a general way as the specification, is understood to include the conditions of contract, the form of contract—that is, the actual agreement—and the specification of the subject matter embraced in the contract. The conditions of contract and the form of contract should only embody, so to speak, the actual legal requirements, which, taken, by themselves, do not affect the description and value of the work and materials. These strictly legal clauses I do not propose to touch upon.

But it will often be found in many specifications that under the leading conditions of contract are placed many clauses which do actually affect the amount of the estimate. This, I think, is a mistake, for at the time of tendering, a builder so often only hurriedly scans the conditions of contract, and when reading them over again, preparatory to signing the contract, may, unfortunately, find there are several items included which he has omitted to price in his estimate. The client does not always see his point, and the builder either has to bear the loss or throw up the work. This remark chiefly applies to a work for which no bills of quantities have been prepared.

But that part of the contract, or, in other words the specification itself, which concerns the actual work and material, should embody every item which may in any way affect the estimate therefore, under the General Clauses, or Preliminary Items as they are often called, I would include the following matters, which are so often to be found only under the Conditions of Contract:—

The date of completion—this requirement may necessitate an extra allowance for overtime or other special employment of labour;

The mode of payment—under certain conditions the builder may require to borrow money to enable him to carry on the work between the times allotted for payment;

Keeping the work in repair for a stated period after completion—this may necessitate an allowance to cover any matter which may crop up under this item;

The insurance fees and fees to any authority should also be included under this heading of Preliminary Items, as also any other matter not coming under a trade heading which may possibly require a price.

Just a hint as to the outside cover of a specification. Put as a reminder in red ink a note of the insurance and date of completion. One is apt to forget these matters.

## Marginal References.

Then as to the marginal references. It will be found a great convenience to all parties if a marginal note is given to each distinct item of work. It will then be seen at a glance where a "bath casing" is placed, or the "spandril framing to a staircase," instead of having to

wade through pages of other subject matter. In addition to the marginal notes, I would put all the principal items under sub-headings, so to speak, in their respective trades; such as all wood staircases under a sub-heading of "Staircases" in Carpenter and Joiner; similarly all casement windows under a sub-heading of "Casement Windows," and all other such divisions of work. And when you come to the many minor items which only require a separate clause to each, these might be put under the one sub-heading "Other Items," or "Other Fittings." These sub-headings should be written across the page.

As to numbering the clauses. This, I think, very important. It will be found of great assistance to be able to refer to the number of a clause in a letter when calling the builder's attention to any special part of the work, as also in the case of cross-references when referring from one part of the specification to another. Each separate clause need not necessarily be numbered, but only each distinct item of work which may embrace several clauses.

As to marginal sketches to illustrate rather involved parts of the specification, I think in many cases these will be found very useful. I would then suggest that the lithographer take them direct from the architect's sketches. If the specification is typewritten or fair copied in the office, then either do all the sketches yourself or else see for yourself that they are copied correctly.

## Provisional Amounts and Prime Cost.

Where should provisional amounts and prime cost items come in a specification? Should each amount come under the trade in question to which it refers, or should they all in a body be put together? I think no hard and fast rule can be applied to this, but small provisional amounts should run on with the subject-matter to which they refer; and distinct and perhaps more costly provisional amounts, and of which there may be no other description in connexion, should be all placed together under the one heading "Provisional Amounts," either immediately following the preliminary items or else at the end of the specification.

The general run of "Prime Cost Items" usually apply more to small matters, and these, I think, should follow the items to which they refer. But if of any considerable amount I would then put them also under the heading "Provisional Amounts."

Should a specification have an index similar to that provided with a technical or scientific work? I think this would be very useful, and it certainly would make a specification a more complete and handy document. The index need only refer to the principal items.

Sometimes it is difficult in a specification to locate the description of a particular part when there is no distinct mark or name on the drawing. Some employ the points of the compass; this is very well if they will apply, but when you get a position perhaps centrally situated, it rather fails in its object. I prefer in such cases to put a number or a letter, and that perhaps in a circle, against the part in question, and so refer to it in the specification. Many of these references will not be required, as the drawings will generally be sufficiently clear to locate the descriptions by referring to the ordinary parts of the building by name or position.

Should an old specification be referred to when describing the work relating to another building? I think only so far as the general clauses are concerned, such as those under the preliminary items, the preambles to the various trades, and the other general covering clauses under those trades. But the details of the work I would write entirely in the first place without any reference whatever to a former specification. All detail descriptions cannot be exactly alike, and you will be far more likely to put in any necessary variation of the detail in question if you think it out as you go along, than if you copy an old description and alter it afterwards to suit, because when you copy an item you cannot properly be thinking out the details yourself.

To obviate omitting, so to speak, any of the

general items common to all work, have by your side a form or tabulated index of the items coming under the various trades. This can be looked down at a glance and all the items extracted which may be required.

### The Word "Best."

There is one word in a specification of which the meaning is often disputed. It is the word "best" when applied to workmanship and materials, especially to materials, and is, I grant, somewhat ambiguous. But I would not use such terms as "best finest," "extra best," "super best," "best best," and so on, but merely employ the word "best" once and for all, and attempt to define its meaning.

Here is a suggested definition of this word:—The word "best," as applied to materials, articles, and workmanship, shall mean that there is no superior quality of material or finish of article in the market, and no better class of workmanship obtainable.

In fact, by defining this word "best," it will only be necessary to mention it in the one clause when stating that all materials and workmanship are to be of the best quality and class.

We are all apt to fall into the error of describing certain materials mechanically, such as timber from a market which has long since been entirely exhausted, or stone from a worked-out quarry, or we use misleading and exaggerated language, "timber free from knots," demanding what, in our own minds, we never expect to obtain. We should only specify what we can get, what we mean to have, and then see that we get it.

At the same time we must not lose sight of the fact that our endeavour must be to obtain the most suitable and best material procurable in the market, and that the work when executed shall be a credit to all.

As to the question of sub-contracts, this, I fear would take some time to discuss, but, as a general rule, let a sub-contract go through the general contractor; but when this is impossible then make the sub-contractor subject to all the conditions of the main contract equally with the general contractor, and in the main contract stipulate that the general contractor is to give every facility to the sub-contractor, and allow him the use of his scaffolding and plant.

### Order and Place.

Having now so far settled the general scope and bearing of a specification, the next step is to put the various items into order and place. As I have before said, we cannot do better, generally, than divide the specification into separate headings or trades as they are called. As to the order in which these trades should be placed, I do not think that very important, only let each trade, if possible, come in the order in which the building would be erected.

Thus the specification would be started with the preliminary items or general clauses, under which heading would come every item that would apply to the building generally as a whole. Then would follow the trade of excavator, this being the first start of the actual work; then the trades embracing the structural parts of the building, such as bricklayer or mason, whichever trade would chiefly apply to the walls. In like manner you would go on constructing the building on paper until it was roofed in, when the trades taking the interior fittings, finishings, and requirements would follow, and finally the decoration and painting.

As to what items each particular trade should embrace, or how many trades the specification should be divided into, that, to some extent, would be a matter of convenience and clearness, consequent on the nature of the building in question. Thus, if pavior is a considerable item, make it a separate trade; but if a very minor point, then the paving may come under the trade of bricklayer. Again, if the drainage is a large item, I would make that a distinct trade, instead of putting it as it is often done, under excavator. Further, floor and wall tiling might either come under pavior, bricklayer, or plasterer, as each of these trades, in certain parts of the country, is performed by the same class of workmen. Many

other items may be treated in the same manner.

Each trade is started with a preamble or the general clauses mostly applicable to all the items under that trade, such as the description of the various materials, and the general covering clauses referring to similar parts of the work in different positions; after which follow in detail the actual items of work. Strictly speaking, a preamble is an introduction or preface, but in a specification the term is applied in the sense of denoting the general clauses and descriptions at the beginning of each trade.

Going more fully into the various items of almost similar description under each trade, I think the best plan, in most cases, is to describe all the items of a similar nature to each floor separately, from the lowest to the topmost story, continuing with other similar items on each floor. But if the description of any item will apply equally over the whole of the building, describe it so, without reference to each separate floor, and thus save useless repetition. As to the exact order of the various items under each trade, I would put them as far as possible in that order in which they would be built. But there is no hard and fast rule to follow in this respect, as in many cases it will be clearer to run them on, regardless of that order.

### Material.

When describing the items, do not omit to mention the class of material, thus state the particular quarry and bed of stone, give the class of wood for the timber and joinery work, and state whether it is rough or wrought. A general clause, such as this, "that all exposed faces of timber and joinery work, except where otherwise mentioned, are to be wrought," will save repetition of this word "wrought."

State if you mean Portland or other kind of cement, the word Portland is often omitted.

And all other descriptions of materials should be clearly defined.

Reverting once more to what is considered the best order in which to place the items of work under the various trades, I know that this is one of the chief difficulties of the beginner, and I will suggest an arrangement for some of the principal items. I have before mentioned that, as a rule, it is best to specify the items in that order in which the work will be built, but that it is not always possible to carry out that order. But I would say that whatever order you once adopt, always follow in all your specifications and in all its parts, so that you will know yourself where to find an item.

I have also said that each trade in every case should start with a preamble, or the general clauses and description of materials.

Now to take the principal items under the various trades respectively. In

### Preliminary Items

I do not think any particular order is essential, but it would be as well to keep the clauses in that order which would mostly run with the order of the work to the building. If old buildings have to be removed, the description would come under this heading of preliminary items. But if a housebreaker is employed, then this work would form a separate and distinct contract by itself. In

### Excavator

Take the surface excavation first; then the deep excavation, such as that to basements and cellars; then the general excavation to the foundations and the attendant items, such as planking and strutting, filling and ramming; and, finally, any other small or particular items. Then describe the concrete foundations, after which the surface concrete and any brick rubbish under, then the concrete floors, roof, and stairs. If the walls of a building are in concrete I would take these immediately after the concrete foundations, of which they then would almost form a part.

Under drainage describe the manholes first, then the pipes with the concrete, then the gullies and other similar items.

The items under the trade of pavior are so

simple that any order might serve, but take first the important items of internal paving, and follow on with the smaller items, and finish with the external paving. In

### Bricklayer

Commence with the general walls of the building, then the damp-course, hoop iron, and other attendant items. Then those parts in cement, such as rough arches, trimmer arches, piers, sleeper walls, half-brick walls, and dry areas. Then the external facings and pointing, gauged or other external arches, dressings, mouldings and ornaments, external glazed brickwork, or flint facings. Then the internal facings and pointing, glazed brickwork, and wall tiling. Boundary and retaining walls and such-like distinct items should come last, and be described separately and completely by themselves. Terra-cotta facings might either come with the other external facings, or be kept as a separate item after the description of the other general work, and before such items as boundary or other walling. In

### Mason

Commence with the rough stone, such as templates and corbels, if not elsewhere described, and follow on with the thresholds, sills, copings, internal pavings, staircases, hearths, and chimney pieces. Then the external paving, steps, and curbs. If the walls are built or faced in stone, I would describe these first completely, with all the labours, mouldings, and ornaments on them, and then follow on with the rough stones and internal items, and finally with the external items, such as paving, steps, and curbs. I would not trouble to keep all stone of a similar nature under the one heading, unless it should happen to come in that order.

### Carpenter and Joiner.

Many make carpenter and joiner two trades. In a large work perhaps it is better to separate them, but in a small work I should certainly keep them together. But it is immaterial whether they are separated or not as long as the descriptions are clear. Personally, I prefer them generally under one heading; you will perceive the reason from the order of the items I will now give you under these trades:—

Lintels, bresssummers, posts, cradling, floor and ceiling joists and plates, sound boarding roof or flat timbers, felt, battens, gutters, and all external joiners' work to the roof or flats, except windows, doors, and skylights, such as rolls, facias, barge-boards, and such-like items.

Then would come quartered partitions, followed on with flooring, windows, skylights, external doors, internal doors, framed partitions, skirtings, dadoes, wall and ceiling paneling, staircases, sinks, water-closets, and bath casings, and other internal fittings, such as shelves, cupboards, and such-like domestic fittings.

Fencing, weather-boarding, or other outside work should be complete items by themselves, and come last.

Half-timber work, with all its attendant items, might, I think, come after the description of the rough timbers.

I would not separate hard words from soft woods, but describe them as they come on each separate story.

(To be continued.)

**An Arts and Crafts Exhibition** will be held at the Art Gallery, Leeds, from the 6th to the 22nd of November next, by the Yorkshire Ladies' Council of Education.

**A Truant School at Dinas Powis** was formally opened recently. The buildings have been built in the Tudor style of Gothic architecture, from plans prepared by Mr. W. H. Dashwood Caple, architect, of Cardiff, who has superintended the erection of the buildings, the contractors being Messrs. E. R. Evans and Bros., of Cardiff. The cost of the buildings, boundary walls, roads, and lodge will be about £14,400. The site was purchased from General Lee at a cost of £1,750.

## LONDON IMPROVEMENTS.

THE Select Committee of the House of Commons appointed to consider the Bill proposed by the London County Council for the demolition of houses in the neighbourhood of St. Mary-le-Strand, St. Clement Danes, Holywell Street and Catherine Street (involving the destruction of the Gaiety Theatre), and the construction of a wide thoroughfare from Southampton Row to the Strand, has, after deliberations extending over a period of nearly a fortnight, passed the preamble of the Bill, subject to certain conditions.

Mr. A. H. Brown was the chairman of the Committee, and the other members were Lord H. Bentinck, Sir. T. D. Gibson-Carmichael, and Mr. Lenty. The Counsel for the Bill were Mr. Pope, Q.C., Mr. Freeman, Q.C., and Mr. Talbot. Petitioners against the Bill were also represented by counsel.

### The Council's Proposals.

Mr. Freeman, on April 21st, opened the case for the promoters, and stated that it was a Bill to empower the London County Council to make a new street from Holborn to the Strand, to widen Southampton Row and High Street, Kensington, and to carry out other street improvements. The projected improvements were the most important that had been brought forward for many years. All through the discussions which had been going on about the Strand improvements there had been two or three desires generally expressed: that a broad street should be opened out from Holborn to the Strand; that Holywell Street should be swept away and its area brought into the Strand; and that the insanitary area in and about Clare Market, which would be immediately contiguous to the line of the new thoroughfare, should be removed. Acting on these views, the Improvements Committee of the County Council had recommended that, without carrying out the whole undertaking, a commencement should be made by clearing away the Holywell Street block of houses, at an estimated cost of £569,000. The Council had adopted that recommendation in July, 1896, and Parliament sanctioned it in 1897.

### What has been done.

The County Council were now acquiring the whole of the property between Holywell Street and the Strand, and they would very soon be in a position to carry out that part of the improvement. In November, 1897, the Council decided to undertake the second part of the general scheme by widening Southampton Row at an estimated cost of £162,000, and that also had been sanctioned by Parliament, and was being carried out. The scheme had been sanctioned for dealing with the insanitary area of Clare Market under the Housing of the Working Classes Act of 1890, the estimated cost being £216,000. The present scheme involved the utilisation of that area. The Council had had in view the carrying out of one homogenous scheme, and the last link of that scheme the Committee were now asked to sanction. The scheme provided for the formation of a street from High Holborn at Little Queen Street, opposite Southampton Row. It would proceed in a southerly direction across and intersecting Great Queen Street, Ardina Street, Vere Street, Clare Street, and Stanhope Street. The street would then read into two branches. The westerly branch, which was to be of the same width as the main street, viz., 100ft., would proceed to Catherine Street and Wellington Street, so as to form an approach to Waterloo Bridge. The easterly branch would pass from Stanhope Street through the New Inn and the Strand to St. Clement Danes Church. The scheme provided for the widening of the Strand to a considerable distance on the north side of St. Mary's Church, and for the disposition of the whole of the site—four acres in extent—within the area bounded by the Strand and the two large semi-circular streets he had described. It had been decided that there should be a

**Handsome Architectural Terminus** at the proposed new street. It would be in a central position, and would be an ad-

mirable site for the erection of handsome buildings; and these would be erected under the supervision of the Council itself. Complaint had frequently been made that in the construction of buildings or the laying out of sites in London no regard was had to combination or general effect. This reproach would not apply to the new site and the new streets. The approach to the new street would be a fine one, even better than those which could be found in Continental cities. It would come with a graceful sweep into the Strand, the Strand being made a wide thoroughfare at that place, with a splendid block of buildings. The gradients would be easy for the convenience of traffic, and the whole of the new streets would be 100ft. wide. The work would be carried out at once in order that the value of sites might not be enhanced by delay. The contemplated alterations would displace 3030 persons of the labouring class, in addition to the persons displaced in Clare Market, all of whom would be provided for by the County Council, partly by the

### Erection of Artizans' Dwellings

on the cleared land, but behind the frontage of the new street, and partly on the Millbank site and elsewhere. The estimate for the necessary works connected with the improvement, and the formation of the new streets, subways, &c., would be £120,000. The cost of acquiring the land, after deducting recoupment, would, it was expected, come to £354,100. To that had to be added the land needed for providing accommodation for the rehousing of persons of the labouring class dispersed. That would be £300,000; making a total estimated net cost of the whole of the scheme of £774,100. The annual charge on the rates on this amount would be less than 1d. in the £1 for the first year, and that did not take account of the amount which would be received under the improvement rate it was proposed to charge. The total cost of land would be £4,442,400; but it was estimated that the recoupment would produce £4,088,300. That was

### A Startling Figure,

but was accounted for by the fact that the character of property in this district would be revolutionised, and the land would let at a greatly enhanced value. The learned counsel dealt at length with the betterment clause. As a rule, in these improvement bills, from twelve months after the completion of the improvement three years were given to find out the betterment value to the owners of property. But, in view of the magnitude of the present improvement, the County Council thought it right that they should have a correspondingly longer period, and therefore they asked for ten years. The County Council asked to be allowed in part to recoup themselves by taking property other than that required for the new street. Thus it would be necessary to provide a new site for the Gaiety Theatre, whose property would be demolished. If the business of the theatre were altogether dispersed and broken up, the cost to the London County Council would be enormous; and the same thing might be said of the "Morning Post" newspaper, which would be displaced. It was only reasonable that the County Council should have power to find

### Sites for the Rebuilding

of these establishments. The clauses for recoupment the County Council regarded as an essential part of the scheme, and without these they would not be able to ask the ratepayers to bear the heavy burden which the bill would involve. Where the condition of property was insanitary, that would be taken into account in fixing the value, and proceedings should be instituted before an arbitrator or a jury, as under the Housing of the Working Classes Act. If the houses were in a proper condition, the only question would be the net value of the property, which would be arrived at by consideration of the net profit accruing from it, plus compensation for compulsory sale. The learned counsel then dealt with the numerous petitions in respect to the bill, among the petitioners being Lord Battersea,

in respect of Dane's Inn, the Duke of Bedford, the Duke of Norfolk, Lord Glenesk, and the proprietors of the Gaiety Theatre. The opposition of the Duke of Norfolk and the Duke of Bedford was principally directed against the operation of the betterment clause in respect of their properties.

### Recoupment and Betterment.

At the resumed consideration on April 24th, it was stated by Mr. G. Shaw-Lefevre that in addition to the new street between Holborn and the Strand, the Strand itself would be widened under the scheme from Wellington Street to the Church of St. Clement Danes. In any public improvement he had always regarded recoupment as the best mode of getting the increment of value arising from the improvement in aid of the cost of the scheme, but there were other cases in which betterment was the best plan. To the south side of the Strand, facing the proposed improvement, it would be absurd to apply the principle of recoupment, and they, therefore, applied the system of betterment there. The scheme would alter the whole character of the district affected, and, in the opinion of the County Council, turn it into a most valuable business locality.

Sir Alexander R. Binnie, chief engineer to the London County Council, said he was responsible for the engineering portion of the scheme. The present scheme has been prepared after consultation with the Institute of British Architects, and it had been specially designed so as to avoid sharp angles and steep gradients. With regard to St. Clement Danes Church, it was not proposed to interfere with the fabric, but only to curtail the churchyard, which was entirely disused, not being an open space. The Committee adjourned until the following day, when Mr. Andrew Young, gave evidence bearing out the statement of counsel with regard to the cost of the proposed improvements.

### Objections Considered.

On the 1st inst. an objection by the "Financial Times" was considered, and Mr. Ram addressed the Committee on their behalf, stating that the new scheme would injure his clients, because it would shut up two streets, which would deprive the buildings of a very great amount of light and air.

The opposition of the vestry of Lambeth was directed to the rehousing proposals of the County Council. Mr. Wheeler contended on their behalf that the site proposed in Lambeth was unsuitable for the increased population, and further, that the district was already threatened with a great increase in consequence of the proposals of the London and South-Western Railway Company. The vice of the scheme was that they were making London too magnificent, too splendid for the people. He urged that the people displaced should be accommodated on the recoupment area.

### The Committee's Conditions.

The Chairman finally announced on May 2nd that the Committee had decided to pass the preamble of the Bill, subject to the following conditions:—"That the preamble is proved so far as regards the Strand and Holborn improvements; that the land south of the Strand be excluded from the betterment area, also the property of the 'Financial Times'; that the number of years in which betterment may be proved be limited to ten, namely, seven for works and three for improvement; that the Danes Court property remain as proposed in the Bill; that the making of the road remain in the hands of the County Council. It is not proposed to re-insert in this Bill Section 133 of the Lands Clauses Act, but that the Sardinia Street works of the Metropolitan Electric Supply Company be reinstated in such a way that there be no interference with the business, and on such a site as will protect them from any proceedings for making a nuisance. With regard to Clause 20, the Committee think some Government authority should give a certificate of approval before property is taken under the valuation provided under Section 21 of the Housing of the Working Classes Act, 1890."

## Correspondence.

### PRESERVATION OF HISTORIC REMAINS.

To the Editor of THE BUILDERS' JOURNAL.

1, GREAT COLLEGE STREET, WESTMINSTER.

SIR,—I have noted with interest, in your issue of the 3rd inst., your remarks on "the rôle of art-critic to the House of Lords" as played by the Earl of Wemyss. You rightly say that we owe thanks to those who take upon themselves the functions of critic and censor in artistic matters of national concern, and you rightly hint that these are functions which might be entrusted to a Government department. I would suggest that another such function might be the preservation of the gifts of the past. We have, in one form or another, a priceless heritage of relics primæval, Roman, mediæval, and modern, and the only statutory provision for their safeguard is the Ancient Monuments Act 1882, which empowers the First Commissioner of Works, under certain circumstances, to take charge of megalithic remains. The National Trust hope during this session to introduce a bill extending these powers to Roman and mediæval remains. I cannot trespass on your space by giving a detailed account of the bill, but I should be happy to give all information in my power to any of your readers who might wish for it.—Yours faithfully, HUGH BLAKISTON.

Secretary, The National Trust for Places of Historic Interest or Natural Beauty.

### EFFLORESCENCE ON TILES.

To the Editor of THE BUILDERS' JOURNAL. EXETER.

DEAR SIR,—Heartily I endorse your correspondent's recommendation of skim milk (see p. 178 in number dated April 26th). When, in the early '60's, I was a journeyman workman in the midlands, my landladies, within whose humble homes I lodged (especially in the Birmingham neighbourhood), used after scrubbing to wash their red-brick floors every Saturday with a quart of skim milk. The bright finish this practice gave the bricks was wonderful.

Of course, the white bloom is caused by lime. A proper foundation for tiles is a cement concrete brought to a level surface by a coating, not less than a quarter of an inch in thickness, of pure Roman or Portland cement, and on the foundation so prepared, when it is sufficiently dry and hard, the tiles are laid in Portland cement mixed with good, clean, sharp sand. Thus laid subsequent white deposits (if any) will disappear after a few cleanings. If from notions of mistaken economy tiles are laid in lime, efflorescence will most certainly arise, and there is no permanent remedy, save taking the bull by the horns and relaying them in the proper material.

Soft soap and warm water will remove grease spots. More serious stains may be modified or got rid of by the application of a diluted solution of muriatic acid and water rubbed on with pumice stone. Care must be taken, however to wash the acid off again after application, or it will assuredly decompose the cement upon which the tiles are laid.

HARRY HEMS.

### REGISTRATION OF ARCHITECTS.

To the Editor of THE BUILDERS' JOURNAL. ARMAGH.

DEAR SIR,—In your paper of the 19th inst., W. M. R. asks your opinion on the "Registration of Architects," and you kindly offer to publish the opinions of some of your readers on the subject, hence my reason for troubling you with the following remarks, as I believe no more momentous question in regard to the profession could be discussed, and I consider you entitled to our best thanks for allowing the matter to be considered in your excellent paper. Now before speaking for, or against,

Registration, I think we should take into consideration the responsibilities of the profession, and its position or standing, as compared with other professions.

First—the responsibilities. These are certainly not light; the architect is, in my opinion, under greater responsibility to the public than either the medical or legal practitioner, that is to say, he can be, and is held more responsible. For instance, take the doctor; is he held responsible for his mistakes? Certainly not—even if the patient dies owing to his mistake or carelessness, it is attributed to the decree of Providence. Then, there is the lawyer, he may lose the case owing to his want of knowledge, mistake, or carelessness, and although the losing of it may mean the loss of a large amount of money to his client, is he held responsible? No; his client puts all the blame on the state of the "law." But how different with the architect; he is not only held responsible by his client for the proper construction, suitability, and appearance, but also for the cost of the work entrusted to him, and what is often worse, he has to contend with the unreasonable ignorance of his client.

Second, the position or standing of the profession as compared with, say, that of the lawyer. Now, notwithstanding the responsibilities of the architect, requiring on his part much ability and continual attention, independent altogether of that æstheticism ever present in him whose heart is in his work, is it not true that in a general sense the lawyer of even average ability is more respected than the architect? Unquestionably this is so. For instance, what position does the architect occupy if he is a witness or plaintiff in a court of law. If the former, he is the target for the abuse of the lawyer, and now and again the object of ridicule by the judge. Not long since we had an instance of a judge saying that "architects were the most unsatisfactory witnesses who ever came before him, as they never agreed with each other." Would he have said this of the lawyers or doctors? Certainly not. And yet we find members of both these professions continually disagreeing with each other. Then, if the architect is obliged to be the unfortunate plaintiff in trying to get his fees, as a rule, what standing has he in court? Simply none. The lawyer opposed to him, although ignorant of the plaintiff's duties, will dictate to him what he should or should not have done, and the judge, equally ignorant in this matter, will decide, according to "his own opinion," the amount, if any, which he thinks the unfortunate plaintiff is entitled to, and the latter must "grin and bear it." Again, take the case of the lawyer working for a committee or public body of any sort, is he dictated to as to how he should prepare his case and carry it through, or is his charge as a rule questioned? No; but in the case of the architect, from the moment he is engaged until the work is finished, he is continually under a sort of censorship, while very often the men who give him the most trouble are those who have graduated as "gentlemen" by virtue of their bank account; and when he sends in his bill these are the men who consider themselves to be the best judges of what his remuneration should be.

Now, why is the profession in this undesirable position? Well, I think there are two reasons which stand out prominently—first, the culpable negligence of the profession in protecting its interests. No other calling or profession that I know of has been so apathetic in this direction! The workman has his trade union, the employer has his federation, the medical and legal professions are safeguarded, but the architect has not the ghost of a shield. True, he is nominally recognised as a professional; but more in the nature of a necessary evil than in any other way. Any man can be an architect, and not only so, but he can at the same time be anything else he likes; for instance, he can be a tradesman of any sort, and also an architect; that is to say, he may draw designs with a piece of charcoal, or, if not able to do so, he can easily purchase for a penny one of those weekly "Architectural Encyclopedias," in which he will find all sorts of designs, and, if he is more dense than usual,

he can apply to one of the "artistic architects" who advertise themselves therein, and he will be piloted right through for next to nothing. There has just been finished within a hundred yards of my office a new front to a house, the lower part made into a shop, and with all the "Greek and Roman" orders over the plate-glass window; the architecture has been produced with gold leaf and varnish, the architect being a sub-manager of a hardware and plumbing shop. This gentleman is also said to be a "sanitary and electric engineer;" I know him very well, as he lately got a job of plumbing work done to my specification; the second reason, in my opinion, is that the profession has not that standing in law it should have. This brings us to the matter of "Registration," and certainly I cannot see how registration would injure the profession, as some believe; all the same I do not believe that it would produce architects of more ability by making them pass "stiff examinations." But it would place the profession in a firm, unassailable position, obtain for it the respect due, do away with a great amount of unprofessional conduct at present practised, and confine the membership to those only practising "solely as architects." But knowing the difference of opinion that exists in regard to registration, I am not confident of it becoming law in the near future. But if this be so, why not have an "Architectural Union" of the United Kingdom, organised for the purpose of taking every legal means possible to protect the interests of the profession, with branches throughout the country. I am confident such a union would receive hearty support, be a success, and very greatly strengthen our position as a profession.—Hoping to hear the opinion of others on this matter, and apologising to you, sir, for the length of these remarks, yours faithfully, "ARCHITECT."

**The Excavations in the Forum at Rome** have brought to light the pedestal of one of Varro's lions, remains of the Republican Rostra, which were rebuilt at least three distinct times, and between the Regia, or Chapter House of the Pontifices, and the Temple of Vesta has been found the tufa boundary wall of the "Temenos," or sacred inclosure, belonging to that temple. At the same time was recognised the "area" of the Calatores Pontificum et Flaminum, or attendants of the Pontifices and Flamens, together with an inscription relating to these officials and belonging to the reign of Trajan.

**The British Royal Pavilion at the Paris Exhibition** is to be a very pretty and interesting building. Its plans have been drawn on the model of Kingston House, Bradford-on-Avon. Within, the pavilion will have a gallery adapted from the Cartoon Gallery at Knole House, Sevenoaks, and the main hall will be adorned with tapestry panels after designs by the late Sir E. Burne-Jones, and executed by Messrs. Morris and Co. The building will be constructed with a framework of steel covered with cement, and its erection has been undertaken by Messrs. John Aird and Co. The designs have been prepared by Mr. Edwin L. Lutyens.

**The National Association of Master Plumbers** of Great Britain and Ireland held its annual meeting last week at Wolverhampton. Mr. John Beal, of Hull, presided, and there was a large attendance of delegates from all parts. A deputation, consisting of Messrs. Walters (Hull) and Rhodes (Leeds) waited upon the Conference for the purpose of urging a federation of master plumbers. Hitherto, Mr. Walters said, in nearly all the difficulties which had arisen between the masters and their men, the former had been defeated owing to the men of the different trades throughout the country being united in one common union. He thought the employers should take a leaf out of the men's book and establish boards of conciliation. They did not want strikes, but so long as the masters were divided into separate organisations, the workmen as a body would be their masters.

## Bricks and Mortar.

EFFINGHAM HOUSE, ARUNDEL STREET,

May 10th, 1899.

"I know what it is to live in a cottage with a deal floor and roof, and a hearth of mica slate; and I know it to be in many respects healthier and happier than living between a Turkey carpet and a gilded ceiling, beside a steel grate and a polished fender. I do not say that such things have not their place and propriety; but I say this, emphatically, that the tenth part of the expense which is sacrificed in domestic vanities, if not absolutely and meaninglessly lost in domestic discomforts and incumbrances, would, if collectively offered and wisely employed, build a marble church for every town in England; such a church as it should be a joy and a blessing ever to pass near in our daily ways and walks, as it would bring the light into the eyes to see from afar, lifting its fair height above the purple crowd of humble roofs."—JOHN RUSKIN.

**A Record Competition.** THE competition for the Cartwright Memorial Hall at Bradford seems to have aroused an exceptional degree of interest in the architectural world. No fewer than 115 sets of designs have been sent in—surely a record number—and these are now being exhibited in the Technical College, at Bradford. The award of Mr. Alfred Waterhouse, R.A., the assessor appointed by the Bradford Corporation, was made known last week, and is as follows: First premium, £150, Design No. 41, Messrs. J. W. Simpson, A.R.I.B.A., and J. Milner Allen, A.R.I.B.A., joint authors, 10, New Inn, Strand, London, W.C. Second premium, £100, Design No. 70, Mr. A. R. Jemmett, Great College Street, Westminster. Third premium, £50, Design No. 44, Messrs. W. A. Pite, F.R.I.B.A., and R. S. Balfour, A.R.I.B.A., joint authors, London. A specially written article on this competition, illustrated with reproductions of some of the premiated designs will appear in next week's BUILDERS' JOURNAL.

**The Royal Academy.** OUR next week's issue will also contain the second of our special articles on the architecture at the Royal Academy, the first of which appeared last week. We regret that owing to the indisposition of our artist, Mr. C. E. Mallows, this article—which was announced to appear in the present issue—has had to be postponed for a week. There will be found, however, in our inset plates this week, full-page illustrations of two of the most notable of all the architectural drawings in this year's Academy, viz., Mr. Townsend's design for the Whitechapel Picture Gallery and the Scheme of Decoration for the Lady Chapel, Holy Trinity, Chelsea, which is the joint work of Messrs H. Wilson, C. Whall and Louis Davis.

**Covent Garden Theatre.** THE improvements that have been carried out at Covent Garden Theatre are now practically completed. It appears that certain exaggerated reports have got about as to the extent of the improvements. The following is an authoritative statement of what has actually been done:—As far as the auditorium is concerned, a new red silk proscenium curtain is to be provided, and will be hung on the lines of the so-called "Wagner" curtain. The porch, vestibule, grand staircase, and saloon, are being re-decorated, and the electric light has been installed in the saloon. A new smoking lounge is being erected over the porch from the designs of the surveyor to the Duke of Bedford. This lounge will also be electrically lighted. Of various minor improvements in front of the House, the whole of the sanitary arrangements have been re-modelled, and an installation on modern principles has been provided. In respect to the stage, the scene stores have been re-modelled, and a big "wing" store has been formed. This will facilitate the change of scenes. The most important alteration of the stage is the full installation of electric light in four colours—white, red, blue, and yellow being used—and the supply is to

be taken from two distinct sources, with the view of providing against emergencies. The system accords with the ordinary practice of the London stage and has been put in by Mr. Bowles. A new feature, arranged by the directors is, however, the position of the regulator room below the stage, with a full view of the scene. The whole of the works have been carried out at great pressure under the personal direction of the directors, and of Mr. Edwin O. Sachs, their technical adviser. Possession of the Opera House was given to the Syndicate on March 25th, so that the property has been in the hands of the Syndicate for one month only. There will be no new stage machinery this season, nor will the auditorium be lighted by electricity; the time at the disposal of the directors was too short for these works.

### Disinfecting the House of Commons.

A CURIOUS suggestion was made last week in the House of Commons. It was to the effect that ozone should be supplied to the House when members were not sitting, the idea being that the presence of ozone in the air would prove inimical to those micro-organisms which are said to be the cause of influenza. The First Commissioner of Works replied that having had the plant necessary for the manufacture and production of ozone inspected, he considered the merits of the process to be very doubtful, and not such as to justify the very heavy expense an installation would involve. After this another member made the more prosaic, but more practical, suggestion that the windows should be opened sometimes. Mr. Akers Douglas said he should be very happy to consider that. As we have not heard that a special Cabinet Council has been summoned to deal with the matter, we presume that the First Commissioner has determined to take upon his own shoulders the responsibility of deciding this momentous question.

### Sir W. Richmond on his critics.

THOSE who supposed that Sir William Richmond regarded with indifference the mass of unfavourable comment which has been aroused by his work at St. Paul's Cathedral must have been disabused of that idea, if they read their "Times" last Saturday. At the length of three columns, Sir William seeks to turn the tables on his critics, and, at the same time to expound the artistic purpose which underlies his much criticised decoration. It is not perhaps surprising that Sir William should complain of the tone and temper of some of his critics; we have pointed out more than once that not all the criticisms have been unexceptionable on the ground of taste. There is justice, too, in the remark that "departure from the commonplace invariably occasions invective, stimulates commotion, and gives rise to exaggerated rhetoric, laudatory or depreciative." We do not complain that Sir William has departed from the conventional. Nevertheless, his own defence of his work is, to a great extent, a justification, not indeed for invective directed against the artist, but for the moderate and reasonable criticism that has been passed upon his work.

### A Lame Defence.

FOR what does the defence amount to? The depressing spirit of a gloomy Puritanism, which regards art and beauty as Satan's most powerful weapons, still—according to Sir William Richmond—presides over a considerable portion of the English character. "Belonging to that spirit is St. Paul's Cathedral, severe, prison-like, accurate; a magnificent skeleton which cries out for life and colour in the centre of a gloomy and smoke-begrimed imitation of ashen-coloured Hades." The cathedral being thus defective must be improved, and Sir William Richmond sets to work to make up for Sir Christopher Wren's defective sense of beauty. Now that is not an attitude which is likely to commend itself either to art critics, or to "the man in the street." We English people, even those of us who are wholly free from the spirit of Puritanism, or the "Norcomformist tempera-

ment" (which, by the way, Sir William Richmond wholly misunderstands), have a strong feeling that in St. Paul's Cathedral we have a supreme work of art, which we ought to guard jealously against the attacks of those who would alter or "improve" it. It is well known, of course, that Wren himself intended that the Cathedral should be decorated, and no one would object to a scheme of decoration that could be shown to be clearly in accord with the spirit of the builder. It is when an artist of a later age, with new and different ideas, applies his own theories and tries his own experiments on a masterpiece of a former age, with the spirit of which he has little sympathy, that protest becomes not only justifiable, but a positive duty.

### Improving London.

THE "Daily Graphic," which is distinguished among daily newspapers for the attention it devotes to architectural matters, has within the past few days published two sketches of considerable interest, illustrative of London as it might be. The one is a view of part of the Thames Embankment, showing Somerset House, Waterloo Bridge, and an imaginary Temple Bridge, which our contemporary suggests will be needed to give perfect communication between the new Broadway from Holborn to the Strand and the South of London, and to relieve the traffic over Waterloo Bridge. The second sketch illustrates an improvement that was advocated in our own columns a few weeks ago. It shows the fine view of St. Paul's that would be obtainable from the end of Cheapside if a further clearance were made of the shops at the corner of Paternoster Row. There is, we fear, not the slightest chance of this improvement being carried out, but we are glad to learn that the house already demolished is not to be re-erected, but that the corner from the Newgate Street end of Panyer Alley is to be rounded off, thus throwing an additional 15ft. or so into the roadway, and leaving more of St. Paul's visible than was the case until quite recently. This is not all we could desire, but it is something at least to be thankful for.

### Chelsea Embankment Disfigurement.

THE following letter from Mr. J. E. Dowson, of 91, Cheyne Walk, Chelsea, appeared in "The Times" of May 2nd. It explains itself, and no comment is necessary:—"Vast sums of money have been spent on reclaiming the northern banks of the Thames and in building the embankment. Trees have been planted, and we were flattering ourselves that sooner or later we should have a pleasant boulevard. But we have to reckon with the County Council and the extraordinary lack of taste of its advisers. Two years ago they promoted a scheme for removing the natural beauties of Chelsea reach, one of the few bits left of picturesque old waterside London. They wanted a bee-line, not a graceful bend in the river, not rich-coloured sailing barges, nor anything not set out with rule and compass. But the residents of the neighbourhood and the artistic world in general happily defeated the County Council. A new trouble has just been sprung upon us. They have evolved the original and magnificent idea of erecting a series of sewer-ventilating shafts along the Chelsea Embankment. These shafts are plain vertical pipes, about 1ft. in diameter and 30ft. in height, and the first of them has just been fixed towards the western end of Cheyne Walk. It is close to the roadway, not more than 40ft. from the fronts of houses opposite, and the top of the shaft is on the same level as the second-floor windows. Even if this tall pipe were necessary, it might easily have been placed close to a tree nearer the river; as it is, it is isolated, and spoils not only its immediate neighbourhood, but the charming views up the river which may be had from this part. In all seriousness, cannot something be done to stop this ugly contrivance which is to send forth volumes of evil-smelling and poisonous gases? A second shaft is being put up opposite Chelsea Old Church, and I understand that nine more are to follow."

## Professional Practice.

**Ballycotton, Ireland.**—The foundation-stone of the new church now in course of erection, was laid on April 23rd. The cost will be about £5,000. Externally the church is to be 98ft. long and 50ft. wide. The height of the aisle walls will be 12ft. from the floor level, and that of the nave walls 25ft. 6in., and to the apex of the roof 37ft. The turret will be 60ft. high. The structure will be faced with pitch-faced ashlar in random courses, having cut limestone dressings to windows and doors, and similar string courses. The style is Romanesque, and the pillars to the nave arcade, which are six in number, will be of Aberdeen granite, on Portland stone bases, with moulded Portland stone caps. The roof will be open timbered pitch pine, while the flooring will be of pitch pine and breeze concrete, and the passages set in caustic tiling. The side aisles will be approached by two handsome porches, and on the southern side of the building there will be three aisles and also the sacristy. The site of the church stands midway on the hillside between the upper and lower villages. The contract is in the hands of Mr. J. J. Coffey, builder, Middleton, and the architect is Mr. J. C. Ashlin, of Dublin.

**Breaston.**—The church of St. Michael, Breaston, has been reopened after having been considerably altered and restored from designs prepared by Messrs. R. Evans and Son, of Nottingham. A stone organ chamber and vestry have been built in place of the brick vestry, and an oak screen has been erected in the chancel, which has been tiled. The walls have been replastered, and the whole of the roof has been stripped off, and the woodwork repaired, whilst a new oak roof has been provided for the south aisle. New choir stalls have been built in the chancel, but these, for the present, are only of a temporary nature, and it is hoped to replace them with something more permanent. It was estimated that £1,000 would cover the whole cost, and this sum has already been raised, chiefly in the village itself, but another £500 is still required to clear the church from debt, and efforts are to be made during the next few months to reduce it. Mr. Charles Baines, of Newark, for whom Mr. Askew Browning has acted as superintendent, was the contractor for the work, and Mr. Haslam, of Derby, and Messrs. Grundy, of London, have put in a new heating apparatus, which is on the hot-air principle.

**Llandaff.**—The Hawthorn School, built by the Whitchurch School Board, was formally opened recently. The school has been built on a site of half an acre, and provides accommodation for 210 children. The building is well and substantially built in courses of Newbridge stone, dressed with red brick groins and arches, and Bath stone sills and copings. The central gable stands out prominently, for the site being somewhat hidden by the surrounding houses, a conspicuous feature was necessary to enable the school to be seen from a distance. The building consists of two classrooms, each 21ft. 3in. by 19ft. 6in., divided from the large room by folding partitions, which can be thrown back when required, and a large school-room, 58ft. 6in. by 22ft., also divided by a folding partition, and is planned in such a manner that anyone standing in this room can command a view of the entire school. There is in addition to the foregoing a large wing. The amount of contract for the erection of the building, including furniture, was £2,131. The architects were Messrs. Robert and Sidney Williams, Borough Chambers, Wharton Street, Cardiff, and the contractor was Mr. William Evans, Merthyr Road, Whitchurch.

**London, E.C.**—A restaurant entitled the "City of New York," has just been erected by Messrs. Porter Bros., in Hand Court, Holborn, London. The chief feature of the new hostelry is what is known as the "Baronial Hall," which will accommodate close upon 400 guests. The hall is an exact copy of the

rooms to be seen in Elizabethan and Jacobean mansions. The galleries, furniture, and fittings are of oak, and the style generally is Jacobean. The hammer beam roof is very picturesque, while the Elizabethan window of stained glass, bearing the arms of the leading American and British cities, is also attractive. In the gallery is a large electric organ. Adjoining the baronial hall are a handsome marble hall, a tea and coffee lounge, and a wine buffet. Immediately beneath the baronial hall is a large billiard-room. The architect is Mr. Horace Wakley, F.R.I.B.A.

**Mountain Ash.**—A new Catholic church has been erected at Mountain Ash from designs by Mr. Bernard Smith, of 8, Gray's Inn Square, London, W., carried out by Messrs. Collins and Godfrey, of Tewkesbury at a cost of £1,000. The building is in Gothic style, and is composed of a nave 63ft. long and 28ft. wide, and a sanctuary 19ft. long by 17ft. wide, in addition to which there are a priests' sacristy, acolytes' sacristy, baptistry, vestibule, and organ gallery, the latter being at the west end. The roof of the building is of pitch pine, with battlemented mouldings resting upon corbels. The church is heated with hot air and lit with incandescent gaslight. The Stations of the Cross are placed around the church. The sanctuary is inclosed by a carved oak rail. The altar is built of Pons stones, and is approached by two steps from the floor of the sanctuary. At the rear of the altar are two gradus covered with marble. Above this is the Tabernacle. It is 3ft. high by 2ft. 9in. wide, and is covered with a carved oak pinnacle canopy, with recess for a crucifix. On the centre panel of the organ is a monogram of the Blessed Virgin with a fleur de lis, emblematical of her perpetual virginity, on the side panels. On the north side of the altar is the ambry for the reception of the holy oil, and on the south side a piscina.

**Nottingham.**—The opening ceremony in connection with the Mundella Higher Grade School and School of Science, in the Meadows, Nottingham, took place last Saturday week. It has been built at a cost of £17,000 from the plans of Mr. C. Clark, of Nottingham. The larger school is in two separate blocks, divided into the Higher Grade and Science department, and the laundry, gymnasium, and dining-rooms. In these accommodation is provided for 402 girls and 502 boys; whilst in a neighbouring building 230 infants will be accommodated. The front of the Graded School, which is in Mundella Road, is of brick, with yellow terra-cotta dressings. On the ground floor is situate the girls' school; on the first floor is the boys' school; and the laboratories, lecture-room, and drawing-class room occupy the second floor. Entrance to the girls' school has been established on Mundella Road, the managers' entrance being also at this point. The boys' and infants' entrance is in Collygate Road. There is on the ground floor a girls' assembly hall, which is 64ft. by 30ft. 6in., and is approached from two entrances. On the south side of the Graded School, in a separate building, are the gymnasium, the laundry, and separate dining-rooms for girls and boys. The gymnasium is 44ft. by 22ft., and is completely fitted with apparatus for the physical development of scholars. The infants' school in Collygate Road, on the north side of the Graded School, has a central hall 48ft. by 27ft., and has two entrances. All the walls up to four feet high, on the interior of the buildings, are faced with white glazed bricks.

**Oxford.**—Messrs. Davy and Salter, architects and surveyors, of Maidenhead and Isle of Wight, have opened a branch office at 136, High Street, Oxford. Mr. Stephen Salter is residing in the city so as to personally superintend the new branch.

**A new Liberal Club** was opened at Hebdon Bridge by Sir Robert Reid, Q.C., M.P. It is an English Renaissance structure, and has cost about £4,000.

## Keystones.

**The Foundation Stones** of the Oldbury Institute were laid a short time ago. The building will cost about £6,000.

**The Restoration of Queen Elizabeth's Lodge** at Chingford is to be carried out at a cost of £700 by the Corporation of London.

**Kirkstall Abbey.**—Plans are to be prepared for a lodge, shelter, and tramway waiting accommodation, with entrance gates, for Kirkstall Abbey.

**A New Bridge.**—The Borough engineer of Sunderland estimates the cost of a bridge, to be erected over the river Wear between Southwick and Deptford, at £129,603.

**Lady Holle's School.**—The Fire Brigade Committee of the London County Council are about to purchase for £31,000 the school site and buildings at No. 38, Red Cross Street, London, E.C., for the erection of a station.

**Memorials to Keats and Lamb** were unveiled recently in the entrance hall of the Passmore Edwards Free Library, Edmonton, by Mr. Frederick Harrison. They consist of medallion portraits of the two men of letters.

**The Restoration of North Creake Church** has been accomplished at a cost of about £2,000. A new marble floor has been laid in the chancel. A carved oak chancel screen, new panels in the chancel walls, and a carved canopy to the font have been added.

**Leeds Builders' Exchange Club.**—The committee of the Leeds Builders' Exchange Club have leased more commodious premises in a new block of buildings opposite the Corn Exchange. Since the establishment of the club some six or seven years ago the membership has steadily increased until it has reached considerably over 300.

**Holy Trinity Church, Bishops Stortford.**—Messrs. J. L. Glasscock and Sons' estimate for the enlargement of this church is, for the extension of the nave, £738; for the erection of a new clergy and choir vestry, £229. The order has been given for the extension of the nave, and the work commenced. Sir Arthur Blomfield and Sons are architects for the above.

**Memorial to Blake, the Painter-Poet.**—A memorial is to be placed on the walls of the Lambeth Central Library in memory of William Blake. It includes a medallion of Blake from the painting by Phillips in the National Portrait Gallery, and, in bas-relief, Blake's own design, "Death's Door," which he made for Blair's "Grave." The work will be placed in the hands of Messrs. Nicholls Bros., and the unveiling ceremony will take place in about a month's time.

**Edinburgh Architectural Association.**—The annual meeting of the Architectural Association was held on May 3rd in the Royal Institution—Mr. T. Ross presiding. The following office-bearers were elected:—President, Mr. James Bruce, W.S.; past president, Mr. Thomas Ross; vice-presidents, Mr. H. F. Kerr and Mr. John Watson; secretary, Mr. Thomas Fairweather; and treasurer, Mr. John Johnstone. The president, in his retiring address, said it would be a desirable thing for the Architectural Association and the Architectural Society (the junior society) to amalgamate.

**Memorial Window to the Duchess of Teck.**—The dedicatory service of the stained glass window in the parish church on Kew Green took place recently. The stained glass of the new window contains in the further light a life-size figure of St. Peter with the Keys, and, in the nearer light, St. Paul with the Word of Life and the Sword of the Spirit. Below the figure of St. Peter is a representation of the scene recorded in the sixteenth chapter of Matthew: "And I will give unto thee the keys of the kingdom of heaven, and whatsoever thou shalt bind on earth shall be bound in heaven, and whatsoever thou shalt loose on earth shall be loosed in heaven." Below the figure of St. Paul is similarly placed the scene of his conversion in Acts ix.

## Under Discussion.

### EDINBURGH ARCHITECTURAL SOCIETY.

"Notes on Romanesque and Byzantine churches in S.E. Italy," was the title of a lecture by Mr. F. W. Deas, M.A., delivered on April 26th, before the above society. Mr. Alfred Greig, vice-president, occupied the chair. After an historical sketch and description of the province of Apulia, typical mediæval churches of the district were discussed. The charm of the work in question was largely due to its being a blending of Romanesque, Byzantine, Saracenic and Norman elements. Many complete exteriors remain, but interiors are scattered and fragmentary. The Basilica is the general type with wide groined aisles and a nave roofed with wood. The E. end is apsidal in most cases. When transepts occur they do not break the aisle walls on plan, but reach the height of the nave. Arcades are heavy with small arches and many pillars. The windows are small, and buttresses, except very flat pilasters at W. fronts, do not occur. This lends to the exteriors great breadth of treatment, contrasting strongly with the rich carving occurring here and there. Carved ornament in these churches is remarkably vigorous and beautiful, and is far ahead of the work elsewhere of the same date.

### ARCHITECTURE OF BUSINESS PREMISES.

On Tuesday evening, May 2nd, at 8 o'clock, in the rooms of The Glasgow Architectural Association, the president, Mr. Geo. S. Hill, I.R.I.B.A., in the chair, Mr. Thomas Ramsay read a paper on "Some points in the erection of a modern office block." In his introductory remarks the author said a building of this class was erected in the first place with the specific purpose of making money for its owners, with occasionally the further purpose of serving as an advertisement. The requirements necessary to allow of its doing so, the author considered to be good situation or site, ease of access, good light, maximum of rental area, ease of re-arrangement to suit tenants, and the minimum of cost, consistent with true economy. The author enlarged on these several requirements, pointing out among other things the necessity for the introduction of a certain amount of fire-resisting, if not fireproof material in the construction, and the absolute necessity of good light, this latter requirement, in his opinion, considerably affecting the money-making capacity of the block.

### MOTORS.

At a meeting of the Society of Engineers, held at the Royal United Service Institution, Whitehall, on May 1st, Mr. John C. Fell, president, in the chair, a paper was read on "Petroleum Motor Vehicles" by Mr. James D. Potts. The author first referred to the prejudicial effects upon road locomotion which were brought about by early prohibitory legislation, which was continued until 1896, when the Locomotives on Highways Act came into force. He then described in approximate chronological order the various types of petroleum road vehicles, commencing with the earliest known efforts to solve the problem of road locomotion by vehicles in which the propelling agent was the power produced by an explosion or internal combustion engine. The simpler, the Hardaker, the Benz, the Butler, the Roots and Venables, the Bollee, the De Dion, and the Petter petroleum motor vehicles of various dates and types were described, and their comparative merits and demerits pointed out. By showing the different stages of progress of some vehicles, the author indicated the lines along which the development of the petroleum motor vehicle had proceeded. A comparison was made of the respective running costs of petroleum oil and petroleum spirit vehicles. The author stated that, taking the average of several of the best known petroleum spirit vehicles, the fuel cost per B.H.P. was found to be about six times greater than that of the author's petroleum oil vehicles.

## New Companies.

### Proprietors of the Central Exchange Buildings, Limited.

This company was registered on April 15th, with a capital of £250,000 in £1 shares (of which 100,000 are 5 per cent. Cumulative Preference) to acquire the Central Exchange Buildings, situate in, and bounded by, Grey Street, Grainger Street, and Market Street, Newcastle-upon-Tyne, to acquire the undertaking of H. Engel and Company, Limited, to enter into an agreement with Edmund C. Wheeler, and to carry on the business of land and property owners and agents, licensed victuallers, hotel keepers, theatre and music hall proprietors, builders, contractors, &c. The number of the Directors is not to be less than three nor more than eight. The first are: William J. Sanderson, gentleman, of Heathdale, Gosforth, Newcastle; Thomas W. Lovibond, brewer, of West Jesmond House, Newcastle-on-Tyne; Joseph Cook, iron manufacturer, of North Biddick Hall, Washington, co. Durham; Edmund C. Wheeler, stockbroker, of 31, Westgate Road, Newcastle-on-Tyne; and James W. Ellis, iron merchant, of 40, Dean Street, Newcastle-on-Tyne. Qualification, £1,000. Remuneration, as the company may decide.

### Measures Brothers & Co., Limited.

This well-known iron and steel merchants' business was offered to the public last Tuesday, the 9th inst. The share capital consists of £285,000 divided into 75,000 5½ per cent. preference shares of £1 each, £210,000 ordinary shares of £1 each, and £75,000 4½ per cent. First Mortgage Debenture Stock. The profits, it is stated, are enough to pay 10 per cent. on the Ordinary shares after all expenses are paid. The business consists largely in the manufacture and sale of iron girders, joists, roofs, bridges, tanks, rails, and similar articles, for which the firm has obtained a world-wide reputation, the customers on the books numbering between 6000 and 7000, including the British and Foreign Governments, H.M. Admiralty, the War Office, Post Office, Crown Agents for the Colonies, Railway Companies, and many Contractors and Builders in a large way of business.

### London and Brighton Brick, Tile, and Terra-Cotta Company, Limited.

This company was registered on April 18th, with a capital of £50,000 in £100 shares, to carry on the business of brick, tile, pottery, pipe, and terra-cotta makers, and to dig, raise, get, buy, sell, and deal in clay, loam, stone, sand, brick-earth, lime, and all kinds of building materials. The first subscribers are:—Henry Partridge, J.P., Castle Hill, Bletchingley, Surrey, 50 shares; Henry A. Barclay, J.P., Underhills, Bletchingley, Surrey, 50 shares; Francis H. Barclay, M.A., The Warren, Cromer, 50 shares; Robert L. Barclay, banker, 54, Lombard Street, E.C., 20 shares; Edward E. Barclay, M.A., J.P., Brent Pelham Hall, Herts, 25 shares; Charles C. Macrae, barrister, 4, Bank Buildings, E.C., 50 shares; Hugh G. Barclay, banker, Colney Hall, Norwich, 1 share. The number of the directors is not to be less than three nor more than five. The subscribers are to appoint the first. Qualification, £250. Remuneration, as the Company may decide.

### William Moss and Sons, Limited.

This company was registered on April 24th with a capital of £25,000 in £1 shares, to acquire, take over as going concerns, and carry on the business of builders and contractors carried on by William Moss and Charles Moss at Loughborough, Leicestershire, under the style or firm of "W. Moss and Sons," and the business of plumbers, glaziers, and gasfitters now carried on by Alfred Swindall and Alan Moss at Loughborough, under the style of "Swindall and Moss," and to enter into an agreement with the said four vendors. The first subscribers (each with one share) are—

Charles Moss, 39, Baxter Gate, Loughborough, builder; Alan Moss, 65, Toothill Road, Loughborough, plumber; Alfred Swindall, 10, Swan Street, Loughborough, plumber; Wilfred Moss, 3, Burton Street, Loughborough, solicitor; George F. Pickering, 73, Russell Street, Loughborough, manager; Harry Chambers, Thorpe Lane, Loughborough, bricklayer; Percy J. Moss, 17, High Street, Loughborough, butcher. The number of the directors is not to be less than two, nor more than three. The first are:—Charles Moss (with £350 per annum), Alan Moss (with £250 per annum), and Robert Moss (with £200 per annum). Qualification, £500.

### Carlisle Estate Company, Limited.

This company was registered on April 24th with a capital of £50,000 in £10 shares (of which 70 are Founders'), to enter into an agreement with Edwin J. Castiglione, Walter P. Gibbings, Kighley J. Hough, Frederic R. Sewell, Alexander Thomson, David Thomson, and John Wood, to acquire any lands and buildings in Cumberland or elsewhere, and to carry on the business of builders, contractors, decorators, builders' merchants, brick, tile and terra-cotta makers, house agents, &c. The first subscribers are: Frederic R. Sewell, Brandlinghill, Cockermouth, colonel, 1 share; John Wood, 18, Bank Street, Carlisle, civil engineer, 1 share; Alexander Thomson, Barwise Court, Carlisle, plumber, 1 share; David Thomson, Barwise Court, Carlisle, plumber, 1 share; Edwin J. Castiglione, Chatsworth Square, Carlisle, land agent, 1 share; Walter P. Gibbings, 31, Lowther Street, Carlisle, surveyor, 1 share; Kighley J. Hough, 34, Fisher Street, Carlisle, solicitor, 1 share. The number of the Directors is not to be less than three nor more than five. The first are: Edwin J. Castiglione, Frederic R. Sewell, Alexander Thomson, and John Wood. Qualification, £500. Remuneration, as the company may decide.

### Argyle Street and Wellington Street Property Company Limited.

This company was registered at Edinburgh on April 28th with a capital of £40,000 in £1 shares, to acquire certain heritable subjects in Wellington Street, Argyle Street, and Holm Street, Glasgow, and to purchase, lease or otherwise acquire and deal with any lands, buildings, rights, heritable property and real estate in Scotland. The first subscribers (each with one share) are: Robert Balfour, 9 and 11, Wellington Street, Glasgow, cabinet maker; R. Thompson, Govan Shipbuilding Yard, Glasgow, shipbuilder; John Bennie, Auldhousefield, Pollokshaws, engineers; Mathew Mitchell, 59, St. Vincent Street, Glasgow, C.A.; Joseph Patrick, 203, West George Street, Glasgow, C.A.; Alexander Russell, 175, West George Street, Glasgow, writer; and Hugh Duncan, 175, West George Street, writer. The number of directors is to be three. The first are John Bennie, R. Thomson, and Robert Balfour. Qualification twenty shares. Remuneration as fixed by the company.

### Jesmond Syndicate, Limited.

This company was registered on May 2nd, with a capital of £10,000 in £1 shares, to purchase for investment or resale, and to traffic in lands and buildings in the City of Newcastle-upon-Tyne or elsewhere, and to carry on the business of builders, contractors, decorators, builders' merchants, brick, tile, and terra cotta manufacturers and merchants, carriers, house agents, &c. The first subscribers (each with one share) are: Edward H. Dowson, 54, Juliet Street, Newcastle, clerk; Fred. H. Bell, Cheltenham House, Heaton, Newcastle, clerk; John E. Liniker, 102, Croydon Road, Newcastle, clerk; William Jordan, 44, Byker Street, Newcastle, accountant; Charles A. Marshall, Romulus Terrace, Gateshead, secretary; L. ## BEST BRITISH BRUSHES

## "Vernolene."

THE "NON PLUS ULTRA" WATER PAINT.

FOR INSIDE AND OUTSIDE.  
PLAIN OR DECORATIVE WORK.

THE only material in the market uniting all essential properties constituting a perfect Water Paint, being non-absorbent to moisture. Body equal to and more durable than Oil Paint. Slow setting without retarding ultimate drying. Easy working, thoroughly washable, disinfecting, without odour, drying with a uniform flat surface, superior to flatted and stippled lead paint. Cheaper than Paint or Wall Paper, and more artistic finish.

CAN BE PAINTED, VARNISHED AND GILDED UPON.

Available in Fifty-eight Lime and Gas-resisting Stock Shades, and the white can be tinted with all better class colours.

"Vernolene" is guaranteed absolutely free from Lime. On deciding upon the use of any Water Paint such guarantee should be exacted to save future trouble.

"Vernolene" keeps for any length of time, and for three months improves in quality.

## SEWAGE DISPOSAL.\*

By D. BALFOUR, M.Inst.C.E., F.G.S.

SINCE the Rivers Pollution Prevention Acts have at length become law, and in general force over the kingdom—equally in England, Scotland, and Ireland—the subject of sewage disposal may properly be said to be of national importance, both in its hygienic and financial aspects. Although finality cannot be applied to any branch of science, it may be, however, generally asserted that the problem of sewage disposal has of late years been tending to a fairly satisfactory solution, alike as regards efficiency, simplicity, and economy as a whole, under the two allied sciences of civil engineering and chemistry. However, the very varied conditions of localities exhibited the necessity of other methods of sewage treatment, so as to afford more reasonable and practicable means for the same, such as the recent and present investigations for the bacteriological purification of sewage. The subject has especially engaged the attention of scientists and legislators since the Rivers Pollution Prevention Act of 1876 down to the present year, with its like-named Parliamentary Bill of 1899. It is not my intention, nor, I dare say, your desire, that I should anywhere exhaustively treat the subject in any of the various processes up to date which have been employed for the purification of sewage. I shall, therefore, now proceed to consider and describe these principal methods in their order, viz., tidal, land, chemical, and bacteriological; and would premise that I am no special advocate of or wedded to any particular system, each locality I consider a study in itself, and that no one system hitherto has been universally applicable. There is no hard and fast line unless so far as the Local Government Board regulations are concerned, and where no loan is required even these regulations do not apply.

### Tidal Methods.

The Rivers Pollution Prevention Act provides that before discharging domestic sewage or trade refuse water into any "stream," the public or private persons responsible shall duly see that "the means used for rendering harmless any sewage matter or poisonous, noxious, or polluting solid or liquid matter falling or flowing or carried into any stream are the best or only practicable and available means under the circumstances."

As regards, however, an outfall into tidal waters—both sea and river—the means practically are greatly simplified by the said Act, which defines that "a stream includes the sea to such extent, and tidal waters to such point as may, after local inquiry and on sanitary grounds, be determined by the Local Government Board, by order published in the 'London Gazette,' save as aforesaid, it includes rivers, streams, canals, lakes, and watercourses," or, to translate the legal phraseology into practical terms, the Act permits the discharge of crude sewage into the sea at extreme low water mark, and into a tidal river with sufficient volume of dry weather flow and tidal rise.

The Local Government Board's report on sewage disposal of 1876, compiled by the late well-known Sir Robert Rawlinson, formerly Chief Inspector of the Local Government Board, and the late Mr. Clare Sewell-Read, M.P., a well-known agriculturalist, provides that "towns situate on the sea coast or on tidal estuaries may be allowed to turn sewage into the sea or estuaries below the line of low water, provided that no nuisance is caused, and that such mode of getting rid of sewage may be allowed and justified on the score of economy."

Sewage in its crude condition may, as a rule, be discharged directly into the sea at low water mark, in a direction which should be decided on after careful float experiments, or into an estuary or mouth of a tidal river. It has been generally necessary in the other por-

tions of a tidal river, excluding altogether the upper reaches, to provide for the crude sewage being simply clarified by either subsidence or chemical precipitation in tanks before discharge into the tidal river. Towns and villages fortunately so situated incur little or no cost for sewage disposal, except where populations are of considerable magnitude. In these latter cases clarification has been obtained by various simple but necessary methods to render the effluents into the tidal river practically innocuous. At the London main sewer outfalls at Barking and Crossness, at each side of the river Thames, clarification has been effected by the use of lime and sulphate of iron, the resultant sludge being conveyed by steam barges sufficiently out to the open sea to quite prevent reflux sludge. The river, according to frequent statutory analysis, is now satisfactorily improved. At Glasgow the sewage has been clarified by the use of lime, alumino-ferri, and coke-breeze tanks, securing a good, clean effluent into the river Clyde, the sludge from which is pressed and disposed of as a manure. Dublin, on the river Liffey, and Newcastle-on-Tyne, I am naturally reminded, both represent still the old state of things. Schemes for the purification of the Liffey have been under consideration.

### Land and Chemical Methods.

The use of land for the treatment of sewage has been in operation in many countries for a considerable period, with altogether satisfactory results, where quantity, quality, construction, and especially management regularly prevail. Land may be said to be the original natural method of sewage disposal. At Edinburgh, the Craigintiny Meadows, 300 acres in area, have been used for 145 years for the continued application of sewage, or, say, since the middle of last century. Though it has been carried on by the landowner, and not yet by the City Council, and that without much skill or outlay, it yields large crops and prices, the latter varying from £25 to £40 per acre for Italian rye grass and permanent meadow grass. The soil was chiefly waste sand, with some clay—both, however, underlying a good black soil of some depth. Four or five crops of grass are cut every season, averaging 3ft. in height, and this is sold to cowkeepers who regularly supply the milk and butter for Edinburgh. Sir Henry Littlejohn, the able Medical Officer of the Scottish Local Government Board and the City of Edinburgh, assures me that no trace of disease has been traceable to the use of the crops or the situation of the sewage farm, which is not very far from large barracks and residential suburbs, the health of which has been carefully watched and found to compare favourably with any part of the city or any barracks in the Kingdom.

On the Continent and in America, land is largely used for sewage purification. Paris, which I again visited last year with my friends Mr. Bechman (city engineer) and Mr. Masson (chief sanitary inspector), possesses 2000 acres of gravel land at Genevilliers, about four miles out of the city. And another farm is in progress at Acheres, in addition to which a considerable quantity of sewage is given to adjoining farmers. Excellent crops and a pellucid effluent brook, with fish therein, are to be seen, and altogether the results are good, the brook being a tributary of the Seine.

Berlin has 11,000 acres of sandy land laid out on the broad, irrigation principle, equally good as regards crops, effluents, and immunity from disease to the workmen (numbering about 1000) and to the locality generally.

I need not add further examples of land treatment, but proceed to briefly explain that it resolves itself into two principal methods, known as broad irrigation and intermittent land filtration.

According to the present Local Government Board Regulations the former method requires one acre of land per one hundred to three hundred population, according to quality of land and nature of sewage, while the second method necessitates one acre per five hundred to one thousand population, and both methods are equally successful, under proper design and management.

Intermittent filtration was originally introduced in 1875, on the recommendation of the Rivers Pollution Royal Commission, and first carried out at Merthyr Tydvil in South Wales, on the banks of the river Taff. These works I visited that year with the late Mr. Bailey Denton, C.E., of London, who was entrusted with the work he so successfully carried out.

The Local Government Board reasonably allow sewers to discharge storm waters, in proper proportions, direct into rivers, while they are also in a similarly augmented volume, for innocuous dilution of the normal sewage. Moreover, the foregoing principles are practically the conclusions and recommendations of the Royal Commission on Metropolitan Sewage Discharge in their report of 1884, in which they specifically recommend intermittent land filtration with some process of deposition or precipitation, and at the same time recommend in new drainage works that the sewage should be "as far as possible separated from the rainfall."

Dr. Percy Frankland, F.R.S., in a paper read at the Institution of Civil Engineers two years ago, stated that "the brilliant results obtained in the filtration of sewage on the intermittent system have naturally led to the investigation of the efficiency of this mode of filtration for the bacteriological purification of potable water." As a somewhat recent and local example of this system, I will briefly refer to works carried out for a town in the North of England with a population of 20,000. The works comprise tanks without the use of chemicals, with 25 acres of porous land, on which the usual succulent crops adapted for sewage treatment are grown. These include osiers, Italian rye grass (usually four crops), mangold wurzel, turnips, celery, cabbage, etc. The sewage, after passing through simple subsidence tanks, flows into the delivery conduits and chambers discharging it on to the land, which is laid in half-acre areas or beds, and used intermittently, in regular rotation, as most indispensable to success. In this manner the land never becomes saturated or sewage-sick, as each successive liquid application is regularly and naturally aerated and oxidised, and subjected, as we now know, to the inherent bacterial action of the soil, and the original porous nature of the soil fully maintained. The under-drainage, "only girting each bed," with aeration shafts, receives the fully treated sewage, and the effluent is discharged into the adjoining brook in such a condition by ordinary regular and systematic attention as to be readily up to the standards of the Rivers Pollution Commission, being regularly without colour, taste, or smell and quite innocuous.

I may add that the Local Government Board's sanction to a loan for such works by Urban or Rural Councils has previously to be obtained by a local inquiry, and that thirty years' repayment is usually granted for the structural works, being about 3 per cent. interest and 5 per cent. with principal; and fifty years' loan is granted for land purchase at about 3 per cent. or 4 per cent. with principal if not arranged on lease, as the Public Health Act, 1875, also provides for. In all cases of loan, it is, up to the present time, indispensable that land (wholly or otherwise partly with chemical or bacterial treatment) must be arranged for and regularly used.

(To be continued.)

**Electric Light for Sleaford.**—The Sleaford Urban Council has decided to apply to the Board of Trade for a provisional order for an installation of the electric light, and to the Local Government Board for sanction to borrow £5,000 for the construction of the necessary plant and works.

**St. John's Church, Inverness.**—The heating having been very unsatisfactory for a long time, it was decided to place the matter in the hands of the specialists, John King Limited, Engineers, Liverpool, who recommend that the old apparatus be entirely removed, and that the church be fitted with their latest improved Hot Water Heating Apparatus; this has now been carried out with the best results.

\* A Paper read before the Sanitary Inspectors' Association on April 8th.

## THE BUILDING TRADES' EXHIBITION.

THE Building Trades' Exhibition, which has been held at the Agricultural Hall during the past fortnight, was brought to a conclusion on Saturday night. As might be supposed, it has aroused a great deal of interest amongst all connected with the building trades, and the attendance of visitors, especially during the last few days, has been very large. This is the more satisfactory as the exhibition has been arranged on practical business lines, the bazaar element, which is so prominent in many so-called trade exhibitions, being reduced to a minimum. It may be presumed, therefore, that the great majority of visitors had some practical connection with one or other of the trades represented, and that the firms exhibiting benefited according. We devoted a considerable amount of space in our last two issues to notices of the various exhibits. A few notices, however, which were crowded out of last week's number owing to want of space, are given below.

### GEORGE HOWSON AND SONS, LIMITED.

This firm has a good selection of sanitary, earthenware, and fireclay goods, including baths, sinks, water closets, lavatory basins, &c. Specialties of the firm are their hospital combination sinks and their domestic combination sinks. The visitor cannot fail to be struck with the beautiful finish and whiteness of the goods shown. Altogether this is one of the cleanest and nicest of the sanitary exhibits in the exhibition. The address of Messrs. Howson is Eastwood Sanitary Works, Hanley.

### SIMPLEX ENGINEERING CO.

The Simplex Engineering Co., of 78, Queen Victoria Street, London, E.C., are showing in the electrical section of the exhibition samples of ironclad resistances or rheostats for regulating or controlling electric current for lighting purposes or motors; also a very neat pattern of small inclosed arc lamps only 14in. in length, and burning from twenty to twenty-five hours with one pair of carbons, which are only 2in. in length. A special feature in this stand is also the simplex clockwork cut-off or switch, which is primarily designed to shut off lights (electric or gas) in shops and show rooms, which it may be advantageous to leave illuminated after usual business hours. The clock has an ordinary alarm clock action, and at whatever hour it is set to operate it performs the function of turning off the lights automatically. It is also designed for other purposes, turning on or turning off water, steam, &c. A model is also shown of a patent commutate facing tool, applicable to any dynamo without removal of armature.

### JOHNSON BROS. LIMITED.

A review of the exhibition would not be complete without calling the attention of readers interested in sanitary developments to the exhibits of Messrs. Johnson Bros. Limited, of Hanley, who are showing (through Mr. G. B. Davies, of Westminster) a varied selection of specialties. One particularly interesting feature to sanitarians is the new Victorian Syphon Closet, which is shown in new royal demi-porcelain, with floral decoration, and in strong fireclay for public institution and hospital work. The main features of this closet are as follows: Large water area, very deep seal, quick flushing, and an impossibility to leave in the basin any foreign matter or dirty water. This is the only closet in the market possessing this very important feature. Assuming, for instance, that a servant empties bucket of slops or dirty water in the basin; immediately the basin automatically (without the chain being pulled) empties out the whole of the contents and refills the basin. Amongst many other types of basins we briefly notice the Lanyon anti-fouling and non-contagious basin, as supplied to Her Majesty's Government for the many departments in our Army and Navy; the Puritas, Invictas, Latestas, and

New Humber suites. The firm's baths, urinal ranges, and other fireclay specialties in connection with their patented flushing apparatus, embody the best and latest practice in the sanitary profession. Messrs. Johnson Brothers claim to be the largest makers of sanitary earthenware goods in the world, employing in their five different factories some 2,500 workpeople.

### MOULE'S PATENT EARTH CLOSET COMPANY, LIMITED.

Messrs. Moule's, of 5A, Garrick Street, London, W.C., showed their patent earth closets. The principle of the earth system is founded on the well-known power possessed by dry earth of deodorising and disinfecting faecal matter: a given quantity of earth, if applied in detail to fresh excrement, destroying all smell and absorbing all noxious vapours. The practical application of this principle consists in the employment of a reservoir of earth, and of a simple and durable form of apparatus suitable for measuring and delivering a regulated charge of earth each time that the closet is used. The system is applicable to most existing closets, to all new closets, and to commodes. Its employment effectually remedies all the evils attendant on common cesspool privies, on water-closets, and on commodes. The earth system is economical. The closets manufactured by the company are available for use with any fine and dry absorbent material. The firm are contractors to the War Office and to the Admiralty. A prize offered by the Liverpool and Manchester Agricultural Society for the closet best adapted in all respects for use under all circumstance, with either earth or ashes, was awarded to this firm.

### A. LEE AND BROTHERS, LTD.

Messrs. Arthur Lee and Brothers, Limited, of Canons March, Bristol, exhibited the Acme patent system of slating and tiling. The object of this invention is to produce slating and tiling in a new and improved manner, so as to procure a better appearance and effect a large saving of labour and material. The system consists in removing a portion of the slates or tiles at opposite corners, and of so placing the slates or tiles that a perfect lap is obtained on all sides of them. Messrs. Lee and Brothers, Limited, have certainly attained their object in a very satisfactory manner. They also had a comprehensive exhibit of roofing slates.

### THE NORTON STONE AND CONCRETE, CO.

This firm exhibited samples of slag from the Tees Bridge Slag Crushing Works, Stockton-on-Tees, and artificial stonework from the Norton Slag and Concrete Works. A special feature of the stand was Brown's patent liquid and air-tight "perfect" joint for sewer and drain pipes. This joint provides for a solid band of Portland cement, so arranged and run into a specially prepared channel as to effectively prevent either liquid or air passing into or out of the sewer, as well as forming a perfect key, thus preventing any slipping of joint should the ground subside. The cement is run into this channel in a liquid form through holes suitably and conveniently made in the socket end of the pipe. The difficulty hitherto has been in obtaining a solid band of cement in consequence of the liquid cement running out of the joint into the pipe, as well as into the trench. With this joint considerable economy is effected in the laying, the only operation being after the pipes arrive on the site to place the felt washer in the socket, wrap a length of gaskin or spun oakum round the pipe, lower the pipe into its position in the trench, run the liquid cement into the holes provided, and a perfect joint is the result. The firm's address is Stockton-on-Tees, and Mr. John Burnjis the managing director.

### STANLEY BROS., LTD.

An exhibit which cannot well be overlooked is that of Messrs. Stanley Bros., Ltd., of Nun-eaton. This firm has erected a substantial

structure which ingeniously displays the many varieties and colours of their glazed bricks. In addition to their salt glazed and enamelled bricks, the firm exhibit a selection of red and buff chimney pots, sanitary pipes and connections, paving and roofing tiles, garden vases, &c. Some perforated tiles for breweries are a speciality of the firm, and these seem well adapted for their purpose.

### THE ANAGLYPTA COMPANY LIMITED.

The Anaglypta Company Limited, of 92 and 93, Great Russell Street, London, W.C., and Darwin, is a firm well known to architects and the trade generally. At the exhibition they exhibited several specimens of their work, all of which showed the excellence of the work produced by the firm. Their stand was very tastefully decorated. The ceiling of the stand displayed to advantage some very high relief decoration in the Italian style. One design in particular we noticed; this was a scroll 2ft. 9in. deep. Several fillings and high relief friezes of very artistic design were prominently exhibited at the stand, which fully illustrated the decorative wealth and the innumerable beautiful colour effects of anaglypta. The decorations are not only beautiful; they are sanitary and very durable.

### JOHN KNOWLES AND CO.

The "Anti-Vap" street gully was one of the features of this stand. Among the many advantages claimed for it may be mentioned the fact that it has a large trap with a comparatively small surface of water exposed, so that in times of long drought the drain is not unsealed by evaporation. Messrs. Knowles and Co., of 38, King's Road, St. Pancras, London, N.W., are the agents for the fireproof granite plaster. This is intended to displace ordinary lime plaster. It is very simple to prepare, and when applied presents a smooth, hard surface. The "vitrifine" stoneware pipes which they showed will stand a remarkably high pressure without any signs of sweating. Among the various sanitary appliances exhibited the "Aquarius" closet was conspicuous. It is necessary with this closet to have only one joint inside dwelling, and the outlet can be turned in any direction.

### T. BRISTOW AND BROTHERS.

Sample pieces of flat channeling, of various gauges of pitching and setts and cubes, were shown on this stand. Sandstone was also exhibited. The kerbs are straight and circular, in Denner Hill, Wycombe, or Heath stone. It is claimed for this stone that it is durable and reliable, has a clean white colour, and is not affected by the severest weather. It has been extensively used as a building stone in the construction of Windsor Castle and many other places of note. The address of the firm is Speen, Prince's Resborough, Bucks.

### W. H. MURRAY AND CO.

This firm has a good display of stone and marble of all kinds. A speciality of theirs is the "Ronez" granite, which is obtained from Jersey. From this granite a tram of almost any size can be obtained; one measuring 2ft. by 1ft. by 4ft. is shown at the stand; specimens of kerbing 12in. by 6in. and 12in. by 8in. are also shown. Owing to the large sizes obtainable the "Ronez" granite is specially suitable for architectural and engineering, as well as for paving purposes. Messrs. Murray, whose address is 48, King William Street, E.C., are also showing some excellent specimens of polished stone and granite.

### THE QUARRY PUBLISHING COMPANY, LTD.

The exhibit of the Quarry and Builders' Merchant takes the form of a museum of specimens of all kinds of bricks and building stones, neatly arranged and ticketed. As the collection is remarkably comprehensive and includes specimens from all parts of the country, it is likely to be of permanent value when established in the offices of our contemporary at 5, Arundel Street, which, we understand is its ultimate destination.

## Masters and Men.

**Manchester and Liverpool Joiners** have succeeded in obtaining an advance in wages from 9d. to 9½d. per hour.

**Wigan Painters** went on strike last week, the masters having declined to accede to a demand for an advance in wages and a settlement of the apprentice question. Over 200 men are affected.

**Three hundred Gosport Labourers** struck last week for an advance of a penny per hour. The works principally affected are those in connection with the fortifications, contracts for which are held by local builders.

**Strike at Newport (Mon.).**—Last Saturday 1200 men employed by Newport builders gave two hours' notice at eleven o'clock, and intend staying out until the employers concede an advance of ½d. per hour all round, and several alterations in working rules.

**Belfast Joiners,** to the number of 238, have returned to work after being on strike for one week. It appears that the Belfast Builders' Association endeavoured to introduce a new set of rules, which the joiners refused to accept, as they state that the change would involve the reduction of their present wages by a penny per hour.

**Lock-out at Selby.**—The Selby branch of the Yorkshire Federation of Master Builders have decided to lock out the labourers, whose demand for 6d. per hour they consider exorbitant. Between thirty and forty men will be affected. The masters expressed their willingness to give 5½d. per hour, but this the men, through their officials, refused to accept.

**The Scottish Carters' Association** have issued a circular to contractors, submitting the following proposal regarding payment for stable duty on Sundays:—(1) That 6d. be paid by employers to carters for each horse attended on Sundays; and (2) that the carters in each stable elect how many horses they will attend, and be paid at the rate of 6d. each horse, but no carter to attend more than ten horses.

**Huddersfield Carpenters and Joiners.**—The operative joiners and carpenters of Huddersfield are still on strike. Another demand has recently been sprung on the masters. The operatives who have frequently to go to other towns on contract work, now ask that when at work in such towns they shall receive the rate of pay prevailing there. In the event of the pay being lower than at Huddersfield, they ask that they shall then receive the sum paid on ordinary work at home. Altogether about 170 men are on strike.

**Masons' Strike at Cardiff.**—A large number of the members of the Operative Society of Stone Masons struck work recently. The strike is owing to the members of the Cardiff Master Builders' Association refusing to amend the working rules and to grant a ½d. an hour advance in wages. The men's chief demands are (1) an increase of ½d. an hour, 8½d. to 9d.; (2) an hour for dinner all the year round, instead of half an hour as has been the rule during the winter months; (3) that work shall cease on Saturdays at noon instead of at one o'clock. There is also a point as to the interpretation of a rule relating to the fixing of dressed stone, which the men claim should always be done by a bona fide mason.

**The Masons at Grimsby.**—A meeting of the Whitby branch of the Operative Society of Masons was held recently, Mr. R. Bulmer presiding. The men have been under three months' notice from the employers, which notice expired on the 1st inst. The delegates'

report stated that the employers, after only partial suspension of work, had met the demands of the men very fairly and courteously, and had conceded the ½d. per hour advance asked for (which would raise the pay per hour from 7½d. to 8½d. per 49½ hours' week), and had also instituted the hour system instead of the old day system. The meeting unanimously expressed satisfaction with the action of the employers, and work will continue as usual.

**Dispute in the Potteries.**—The dispute between the Master Builders' Association of the Potteries and Newcastle-under-Lyme and the local carpenters and builders was referred to Judge Jordan for arbitration. The carpenters and joiners had given notice asking for a rise in wages from 8½d. to 9d. per hour, and for a reduction of the number of working hours. They also asked for the abolition of piecework under Rule 7. Judge Jordan certifies that Rule 1, which refers to hours, shall read as follows:—"The hours of work in the summer months shall be these—from the 1st of March to the 31st of October inclusive from 6.30 a.m. to 5.30 p.m., with one hour and a half allowed for meals for five days of the week, and from 6.30 a.m. to 12.30 p.m. on Saturdays, with half an hour for breakfast." The remainder of the rule is unaltered. Rule 2 has been altered so as to make the wages paid to skilled operatives 8½d. per hour. This does not affect Rule 3. Rule 7 stands unaltered. The award comes into force on July 1st next. The advance in price does not apply to overtime. In the number of working hours there is a reduction of one and a half hours per week for eight months of the year.

**The Dispute in the Building Trade.**—The master plasterers are perfecting their organisation, and have decided to locate their central offices in Bradford for a time. Most of the building trade unions, who received a communication from Mr. Hassall, the Secretary of the Central Association of Master Builders, on Monday last, have sent in their replies. They were asked to give an affirmative answer to two questions: "Are you in sympathy with the Plasterers' Union? and do you intend to support them during their lock-out?" The reply in every case has been a refusal to answer the questions asked. The stonemasons have replied, saying that the time given for a reply is so short that a vote of the members cannot be taken, and the executive of the Society does not feel justified in giving a reply without consulting their constituents. The replies from the bricklayers, carpenters, painters, and plumbers are very much on the same lines. It seems almost too much to ask one trade union to say that it is not in sympathy with another union when it is attacked. The unions appear to be very indignant that they should have been asked such questions, which they regard as being deliberately put to precipitate a general lock-out. At a meeting of the executive of the Yorkshire Federation of Master Builders, held in Leeds on the 5th inst., it was decided, in consequence of the attitude of the men engaged in the building trade at Hull, in regard to the question of non-union labour, to lock out to-day 25 per cent. of the men employed. The federated employees of Hull, acting upon this resolution, on Saturday locked out 25 per cent. of their men, and the Union at once decided that the remaining 25 per cent. should come out. The Scarborough Master Builders' Association have decided that they will not bring the resolution into effect until June 1st.

**The Working Men's Club, Newburn-on-Tyne,** at present in course of erection (Messrs. Hicks and Charlewood, Architects, Newcastle-on-Tyne), is ventilated by means of "Cousland's improved 'Climax'" patent "Natural Exhaust" ventilators and air inlet panels, which have been supplied by the "Climax" Ventilating and Heating Company, Limited, 93, Hope Street, Glasgow, the sole manufacturers of this latest improved form of ventilator.

## Engineering Notes.

**The Memorial Hall,** Farringdon Street, London, E.C., is to be provided with an installation of the electric light.

**Tramways Bills.**—A Select Committee of the House of Lords, consisting of Lord Lauderdale (chairman), Lords Boyle, Digby, Napier, and Glenesk, had under consideration, on May 2nd, the Bill under which the Manchester Corporation seek powers to provide for the working of tramways in Manchester and outside the city by electricity or other motive power, to confirm agreements with outside authorities as to the purchase and taking on lease of outside tramways, and for other purposes. — Mr. Balfour Browne, Q.C., in explaining the scheme, said the Manchester Corporation owned fifty-six miles of tramways in the city, which were leased to the Manchester Carriage and Tramways Company. All the leases would have expired by 1901, and in view of that the matter was considered by a Committee of the Corporation, and a report was issued in favour of the Corporation working the whole of the tramways. In May, 1898, the City Council passed a resolution to promote a Bill to enable the Corporation and any neighbouring local authorities to make arrangements for working tramways upon terms. In 1897 they got a Bill through Parliament, authorising the Corporation to work the tramways in Manchester. In 1898 the Manchester Carriage and Tramways Company applied to Parliament for an Act to equip their lines with electricity, but their Bill was rejected. The Corporation had agreed with Failsworth, Audenshaw, Droylsheden, Gorton, Denton, Levenshulme, and Heaton Norris in regard to the working of the tramways, and one of the objects of the Bill was to confirm the agreements that had been voluntarily entered into on the question with these authorities. No agreement had been entered into with the Strefford, Moss Side, and Withington Urban District Councils that Manchester should work their trams. The real opponents to the Bill were the Stockport Corporation. He was not sure that the Salford Corporation offered a serious opposition. — The Committee, after deliberating in private, announced that the preamble was proved and the Bill could proceed, and after the clauses of the Bill had been considered it was passed. — On the same day the Committee had under consideration a small general purposes Bill promoted by the Oldham Corporation, for the purpose of making new tramways, reconstructing some of the old existing tramways in the borough, entering into financial arrangements consequent upon the works proposed, and for other purposes. Mr. Pember, Q.C., and Mr. Frere appeared for the promoters. Mr. Pember, in entering into an explanation of the scheme, said the Corporation wished to be empowered to construct additional tramways, make streets, and to have conferred upon them further powers with regard to tramways in and near the borough. There were seven miles of tramway belonging to the Corporation, which were leased separately by the Manchester Carriage and Tramways Company and the Manchester, Bury, Rochdale, and Oldham Company, the leases of which would fall in in 1901. When the Oldham Corporation proposed to take them a short branch line would be constructed to join the two systems. They were estimated to be worth £71,000, while the total cost to the Corporation would amount to £100,000. According to one section of the Bill the Corporation would have power to work the tramways in Royton, Crompton, and Lees. The British Electric Traction Company, who were represented by Mr. Balfour Browne, Q.C., petitioned against the Bill. This Company were entitled under a light railways order to construct certain light railways from Little Heaton to a point in the Middleton Road in the borough, and covered streets to be traversed by the proposed new tramways. The Committee, after hearing the arguments for and against the Bill, decided that the preamble was proved, and allowed the Bill to proceed.

**Victoria Station Improvements.**—A Select Committee of the House of Commons, presided over by Mr. S. Hoare, has been considering for some days past the Various Powers Bill of the London, Brighton, and South Coast Railway. The main object of the Bill is to obtain Parliamentary powers to carry out extensive improvements of the company's terminus at Victoria, at a cost of £1,080,000, by extending it along the Grosvenor Hotel side of Buckingham Palace Road as far as Ebury Bridge. The Bill also provides for the completion of four lines of rails as far as Three Bridges, and the carrying out of other works. At the committee's meeting on May 1st, Mr. Charteris, on behalf of the Duke of Westminster, stated in reply to the chairman that the opposition of the Duke to the clause empowering the company to take a portion of certain buildings in the Buckingham Palace Road without, under Section 92 of the Lands Clauses Act, acquiring the whole, was one of principle. After Mr. Baggalay, Q.C., had addressed the committee on behalf of Messrs. Smith, Parfrey, and Co., of the Pimlico Wheel Works, which would be swept away by the scheme, Mr. Kimber, Q.C., was called, and gave evidence on behalf of the Grosvenor Hotel Company. The Bill contained a clause exempting the railway company from the necessity, presumably, of compensating for the cutting-off of supplies which were absolutely essential for the carrying on of any hotel business. If the exemption clause remained in the Bill, the railway company would be able to leave the hotel like a ship without a rudder and without a boiler. He contended that the damage to the hotel by interference with the wells would be such that the railway company ought to be compelled to take the whole undertaking. The committee having deliberated in private, the chairman said that with reference to the Duke of Westminster's petition, the committee would hear counsel on the clauses, and the point would be reserved until then. With regard to the Grosvenor Hotel, provided the amended plans with regard to the interference with the wells were adhered to, the committee would not further alter the clauses in the Bill. Subject to these reservations, the preamble of the Bill, so far as it had reference to Victoria, was found to be proved.

**Ventilation of Infirmaries.**—Mr. William Key of London and Glasgow is the engineer for the ventilating and warming, and hot water arrangements at the new infirmary, Paisley. The air of all the wards and rooms will be renewed from ten to twelve times per hour—without draughts—and 7,000,000 cubic feet of air will be propelled throughout the buildings every hour, on his improved plenum method. The same system is being applied to the workhouse infirmary at Wakefield. Here 3,500,000 cubic feet of air are being propelled into the buildings every hour, and the air is renewed from ten to twelve times per hour, without draughts. The Wakefield Guardians devoted twelve months to the investigation of the ventilation of buildings throughout the country so that they might have the best method, and thereafter unanimously decided to give the work to Mr. William Key.

Surveying and Sanitary Notes.

**Powick Sewerage Scheme.**—Mr. W. A. Ducat, Local Government Board inspector, held an inquiry on May 5th, at the Callow End Schools, into an application to the Local Government Board by the Upton-on-Severn Rural District Council for power to borrow £1,400, for works of sewerage and sewage disposal for the hamlets of Pole Elm and Callow End, Powick.

**Manchester Sewage.**—At the adjourned inquiry of the Local Government Board into the application of the Manchester Corporation for sanction to borrow money for sewerage and sewage disposal, Dr. Percy Frankland stated that he had watched the performance of the double-contact beds at Davyhulme, and found it perfectly satisfactory. An important element in the treatment of Manchester sewage at Davyhulme would be the existence there of the very large storage tanks in which precipitation was now carried on. Under the bacterial system these tanks would be immensely useful. Mr. J. P. Wilkinson, civil

engineer, formerly in the City Surveyor's office, and well acquainted with the lands at Carrington and Flixton, said there was sufficient fall in the land at Carrington to take the effluent from Davyhulme—save for a small portion above the limit of gravitation—either the chemical effluent from the tanks or the effluent from the primary bacteria beds, or first contact beds. Of the 213 acres of land proposed to be acquired, 25 or 30 lay above the gravitation limit, so that practically 180 acres would be available by gravitation and 33 would be used for other purposes. The strata had been examined both for the purposes of the inquiry in 1893 and for the present inquiry, and the result showed the land to be suitable for putting the effluent upon it as long as they kept to shallow under-drainage not exceeding 4ft. In answer to Major-General Crozier, the witness said that, taking the second contact beds, none of the effluent could go into them without pumping. Various other gentlemen gave evidence, and after the inquiry the inspectors visited the lands and the sewage works.

**The Sanitary Institute Dinner** was held a short time ago at the Hôtel Métropole under the presidency of the Duke of Cambridge.—“The Houses of Parliament” was proposed by Sir R. Thorne-Thorne, and, in responding, Mr. T. W. Russell, M.P., referred to the question of the housing of the poor. The Bill before the House, he said, did not touch the vital question which came out of the overcrowding of the poor. He defended the recent vaccination measure.—In proposing the toast of the evening, “The Sanitary Institute,” the chairman remarked that amongst the many advances that had been made in this country of late years, none had been of such public advantage as the improvements made in dealing with sanitary matters. They never thought of such things as microbes sixty years ago. Their Institute was created by the march of intellect and the march of events. He commended the proposition for increasing the usefulness of the Institution, and was glad that already they numbered 2300 members. Their income last year was £8,753, and they had an invested capital of over £12,000.—Mr. Henry Law responded.

Property and Land Sales.

CHESTERTON AND SONS' LIST OF BUILDING LAND FOR DISPOSAL.

BARNES COMMON.

Overlooking the well-known common, gravel soil, 315ft. frontage. For SALE Freehold, at £5 per foot; ripe for erection of villas at £45 per annum.

BEULAH HILL.

Commanding beautiful views, an estate of about 8 acres. For SALE, Freehold, suitable or residences, £60 to £70 a year.

NORRURY.

Several blocks of choicely placed land to be LET on Building Lease (with advances if required) suitable for residences £70 to £100 per annum; also others for villas £12 to £45 per annum.

WHITTON HOUNSLOW.

About 10 acres of Land for SALE, Freehold, £3,600, gravel soil; good situation.

HARRINGAY.

Twenty plots of ripe building land will be SOLD by AUCTION at the Mart, on Thursday, May 25th, 1899, at Two o'clock.

For further particulars apply to Messrs. CHESTERTON AND SONS, Surveyors and Land Agents, 51, Chesham-road, London, E.C., and Kensington. Telephone No. 5436 Bank.

LOCAL SALE OF PLOTS on MAY 31st.—ILFORD.—Uphall Estate, First Portion.—Free conveyances; payment by instalments; roads made; tithe and land tax free.—The special attention of Plot Buyers, Builders, and Creators of Ground-rents is directed to the sale of this Land, which is ripe for immediate building.—ONE HUNDRED and THIRTY-NINE PLOTS of ripe FREEHOLD BUILDING LAND, having frontages to the following thoroughfares, viz., Ilford-lane (a road 50ft. wide, leading from Ilford Broadway to Barking), Wingate-road, Natal-road, and Uphall-road. The plots vary in frontage from 16ft. to 37ft., and in depth from 90ft. to 125ft., and are ripe for the erection of small houses and shops, and the immediate creation of ground-rents.

MESSRS. DOUGLAS YOUNG and CO. will SELL the Above by AUCTION at the Angel Hotel, High-road, Ilford, on WEDNESDAY, MAY 31st, 1899, at SEVEN o'clock in the evening.

Particulars and conditions of sale may be obtained at the Mart, E.C.; of the Solicitor, J. HOWARD SMITH, Esq., 7, Finsbury-circus, E.C.; or of the AUCTIONEER, 51, Coleman-street, E.C., Clapham and Ilford.

Between BLACKHEATH and CHARLTON.

Important FREEHOLD BUILDING ESTATE.

To Land Companies, Capitalists, and Building Speculators.—The choice Freehold Building Estate, known as Eastcombe, a portion of the estates of the late William Angerstein, Esq., on the main road from Blackheath to Charlton, about half a mile from Westcombe Park and Charlton Station, from whence London is reached by South-Eastern Railway in twenty minutes, about a mile from Blackheath, and in the midst of a healthy and highly popular district, comprising a commodious Family Residence, with two lodge entrances, stabling, charming pleasure grounds, and well-timbered miniature park, let on yearly tenancy of £280 per annum; together with beautifully undulating pasture land, extending from the Charlton-road with long frontage thereto, to Victoria and Invicta roads, Westcombe-hill, the whole comprising 38 acres. The estate is immediately ripe for development, and offers exceptional facilities to capitalists for the creation of ground-rents, and the demand for middle-class houses in this favourite locality assures successful building operations.

MESSRS. BEADEL, WOOD and CO. will SELL by AUCTION, at the Mart, Tokenhouse-yard, London, E.C., on TUESDAY, MAY 16th, at ONE o'clock precisely, the above valuable BUILDING ESTATE, in one lot.

Particulars, with plan and conditions of sale, may be obtained of W. T. HARTUP, Esq., Solicitor, Norwich; and of Messrs. BEADEL, WOOD and Co., 97, Gresham-street, E.C.

BLACKHEATH and GREENWICH.

VALUABLE FREEHOLD BUILDING LAND.

To Builders, Land Companies, and Speculators.

A plot of valuable Freehold Building Land, ripe for the immediate erection of villa residences, situate in and having an important frontage of 172ft. to Westcombe-hill, within five minutes' walk of Westcombe-park Station, on the South-Eastern Railway, and only twenty minutes' ride from London Bridge, and containing about half an acre. With possession.

A valuable Freehold Building Site, known as Combe Farm, available for the erection of first-class villas and shops, situate in and having a frontage of 300ft. to Westcombe-hill, and 200ft. to Milton-road, adjacent to Westcombe-park Station, and containing about 2 acres. Let on a yearly tenancy.

A block of Freehold Building Land, of about 6 acres, with a frontage of 1100ft. to Horn-lane, near the Woolwich-road, and let on a yearly tenancy. Suitable for the erection of manufacturing premises.

An important area of Freehold Building Land, situate adjacent to the Woolwich-road, ready for the immediate erection of houses and business premises, and containing about 26 acres. Let on a yearly tenancy.

MESSRS. BEADEL, WOOD & Co. will SELL by AUCTION at the Mart, Tokenhouse-yard, London, E.C., on Tuesday, May 16th, 1899, at one o'clock precisely, in four lots, the above valuable FREEHOLD PROPERTIES, being a portion of the estate of the late William Angerstein, Esq.—Particulars, with plans and conditions of sale, may be obtained as above.

WORSHIPFUL COMPANY of CARPENTERS.

THE ANNUAL EXAMINATION in CARPENTRY AND JOINERY

will be held at Carpenters' Hall, London Wall, on JUNE 14th, 15th, 16th, and 17th. Certificates and Medals are awarded to successful candidates.

Free Lectures to candidates and others will be given on the subjects at the Hall on THURSDAYS, 11th, 18th, and 25th MAY, and 1st JUNE, at 7.30 p.m. The next lecture will be by Professor T. ROGER SMITH, F.R.I.B.A., on "Temporary Structures, Floors, and Shoring."

For full particulars and list of lectures, apply to S. W. PRESTON, Esq., at the Hall.

SANITARY INSPECTORS' EXAMINATIONS.—An Associate of the Sanitary Institute thoroughly PREPARES CANDIDATES for the above Exams. by correspondence; no books are required.—For particulars and testimonials apply, "Certified Coach," 31, Herbert-road, Plumstead, S.E.

ANSELL and MALLOWS, Architectural Draughtsmen and Quantity Surveyors, 21, Buckingham-street, Strand, W.C.

R.I.B.A. EXAMS. PREPARATION, personally or by correspondence, in three, six, nine, or twelve months' courses. Architectural Lending Library. Special three months' finishing courses.—For full particulars apply to Messrs. HOWGATE and BOND, Associates R.I.B.A., Perchar House, 70, Gower-street, W.C. (close to the British Museum)

ARCHITECTURAL Institute, Society of Architects, and Civil Service Technical Examinations. Preparation by correspondence, personally, or in residence. Seventeen first places.—MIDDLETON and CARMEN, 19, Craven-st., W.C.

MASON'S CHISEL, STEEL,  $\frac{1}{2}$  to  $1\frac{1}{8}$  octagon, 12s. to 16s. per cwt.; Chisels, 6d. lb.; Best Cast Steel for Lettering Tools, &c., from  $\frac{1}{4}$ d. lb.—E. DEALEY, Moore-street, Sheffield.

APPOINTMENTS VACANT.

TERRA-COTTA MOULD-MAKERS, Model-makers, and Clay Workers. CONSTANT EMPLOYMENT for good workmen. STIFF and SONS, Lambeth, London, S.E.

ARCHITECT'S JUNIOR ASSISTANT REQUIRED at once. Apply, stating qualifications and terms, to JAMES E. WIGFULL, 14, Parade Chambers, Sheffield.

A VACANCY has occurred in an old-established Brighton Architect's office for a PREMIUMED PUPIL. Good opening for a smart youth.—Apply "C. A. S.," BUILDERS' JOURNAL Office.

APPOINTMENTS WANTED.

YOUNG ARCHITECT, A.R.I.B.A., ASSISTS in the PREPARATION of DRAWINGS, TRACINGS, &c., at his own Office. G. SOOREB, 28, Newman-street, W.

QUANTITIES prepared, specifications written, works measured, and variations adjusted by reliable London Surveyor. Over twenty years' experience. Special terms by arrangement.—"Surveyor," office of the BUILDERS' JOURNAL.

PERSPECTIVES.

E. BECKITT LAMB, 31, Craven-street, Strand, W.C.

TRACINGS.

MISS GADSBY, 6, Wine Office-court, Fleet-street, E.C.

ADVERTISER, will be at liberty June 1st, requires POSITION as REPRESENTATIVE or GENERAL MANAGER of firm who manufactures building specialties, decorative line preferred; good draughtsman, designs, and used to Limited Companies' methods; moderate salary.—Box 1049, BUILDERS' JOURNAL.

ARCHITECT'S and SURVEYOR'S QUANTITIES PREPARED quickly and accurately on special terms. References.—ADAMS, 28, Eldon Chambers, 30, Fleet Street.

BUILDER'S MANAGER or General Foreman.—A Builder, Bricklayer by trade, giving up business, seeks Position as above. Experienced in all branches. Excellent references.—Box 1059, BUILDERS' JOURNAL.

RE-ENGAGEMENT as Foreman of Joiner's and Machinery Shops, or Steam Joinery Works. Used to high-class work, staircases, &c. Healthy, reliable, energetic. Good references. Good settler-out; take off quantities; price same. Age 45. Widower. State wages.—Box 1061, BUILDERS' JOURNAL.

SOUTH AFRICA. A gentleman experienced in the Building Trade is arranging a BUSINESS JOURNEY in South Africa under very exceptional advantages, and is open to represent a few good firms. Moderate terms.—"S.A.," BUILDERS' JOURNAL Office.

## An Architectural Causerie.

### A Coming Restoration.

THE vote of the Royal Academy, by which the income derived from Lord

Leighton's bequest was allocated to acquiring and commissioning works of decorative painting, sculpture, and architecture, constituted a momentous step whose wide significance has in great part been overlooked by a perverted and callous public. The discretions of the Academy are in general characterised by a too stolid conservatism, but this decision as to the application of the Leighton bequest is to a large extent initiative, and constitutes a vigorous and influential effort to take part with those who would see Art restored to its true place as an essential factor in a graceful and polished civilisation. Unfortunately with the English, Art has by habitude and long association of ideas become identified with museums and art galleries. In England applied art is popularly esteemed and recognised merely for its power to confer ornateness; it is valued for its power to make an object look costly, and thus swell the dignity of great possession attaching to the owner. The public is content to see its churches with bare walls, and deal altars covered with brocade from the bridal train of the vicar's wife; but a hotel or a restaurant must be be-gilt and be-marbled in senseless, comfortless lavishness, so that visitors may sleep there in comfort and enjoy their meals, knowing themselves to be rare expensive souls. Thus it happens that in a kingdom which possesses many of the art treasures of the world, distributed to many centres free to the enjoyment of all, we see the most ludicrous incongruities and anomalies of taste bunched together side by side. Cheek by jowl with the Elgin marbles, and the Greek and Etruscan ceramics in the British museum, are to be found those stores of æsthetical blasphemies which have made "Tottenham Court Road" a bye-word with the initiated. People who profess a moving admiration for great Art, and visit the London galleries with some persistency, will yet, on the spot, ere they return suburbward; buy Christmas cards with snow-scapes rendered in powdered glass; an inkpot which affects to be a half-penny bun; a pepper caster which assumes to be a toadstool; and, let us say, a badly stuffed kitten glued to a disk of flannel by way of pen-wiper. They litter the rooms of their houses with steam-turned "ornaments," tufts of dyed grasses, imitation palms, taudry photograph frames, cotton wool spiders and all the rest. If it is such as these who extend an unqualified applause to

the designs of Burne-Jones, the eminent critic who stigmatised such unreserved admiration as denoting "the higher vulgarism," was happily inspired. There seems, indeed, to be an opening here for a few additional chapters to the great "Book of Snobs," for these self-conceived enthusiasts for Art do not hesitate to patronise also the puppy-dog-and-Christmas-berry coloured supplement to the weekly illustrated press; and are content to fasten up the perennial festive cats where they may be seen on a first awakening in the morning. For these wealth is rather a means to more extravagant assumptions, than an occasion for refinement of taste. Their houses exemplify an art of design which is little else than the art of simulating the extremest costliness at the smallest outlay; while within doors a marble replica of the Venus of Milo or the Apollo Belvedere, balances a Neapolitan sculpture of a little

### American Architecture.

ART and Literature naturally belong to the older civilisations of the world. In a new country, men are too exclusively occupied in the struggle for material wealth to have any time to give to the making of books, pictures, or beautiful buildings. As the country becomes more settled, and new generations arise, from whom is demanded a less strenuous life than that of their fathers, the arts begin to have a chance. Young men of artistic bent have leisure to follow their inclinations; they travel in Europe, and come home to imitate as closely as they can the methods of the European artists, whose works they have studied. The next stage of development is the production of works of art (books, pictures, music, buildings) that are natural, spontaneous, unaffected, owing little to foreign influence, but racy of the soil, and expressive of the national characteristics of the people. Is there any new country that has yet attained, or is within reasonable distance of attaining, to this dignity? Is there in literature, or architecture, or the fine arts, any such thing as a distinctly American,

AT THE ROYAL ACADEMY, 1899.

girl in her mother's silk dress, and is set beside a steam-carved dinner-waggon to look on at the gentlemen cracking walnuts between rounds of the port. It was the effort to break down this perversion, affectation, and insensibility of the public, and restore Art to its pristine dignity, and significance, that engaged the energy and enthusiasm of William Morris, and his ideals have found invaluable support from associations of enthusiasts in the same cause. Hitherto, however, the movement has found little of support or even serious recognition from established seats of artistic authority or education, and the late action of the Royal Academy, slight as it may seem in the actual promise it holds forth, is a significant mark and acknowledgement of the reality and force of the instauration of a wider scope and application of the Arts, and the restoration of the handicrafts to the position they held prior to the commercial activity which followed the introduction of steam power. Furthermore it promises to be one of the most useful, as it is one of the most influential, steps that have been yet taken in this direction. The mob takes colour from its surroundings, and if our cities and towns are constructed, decorated, and furnished in dignity, reserve, truth, and beauty, the same sentiment will in time indubitably find place in the lives and the homes of the people. B. C.

Australian, or South African style? Confining ourselves for the moment to the oldest of the newer civilisations, that of the United States of America, we may freely admit that American literature has long ago left off its swaddling clothes. Emerson, Longfellow, Whittier, Lowell, Hawthorne, Motley, were the peers of their contemporaries of the pen the world over; but where in the domain of art shall we find names of equal eminence? These questions are suggested by an interesting symposium that appears in the pages of the "Architectural Annual," published by the T-Square Club, of Philadelphia. The editor of the "Annual" addressed to a number of American architects and others this question: "Do you as yet see any signs tending to indicate the development of an unaffected style of architecture in America?" The replies received indicate considerable divergence of opinion. It is pretty generally agreed that as yet there exists nothing worthy of the name of a national architecture; but while some neither see nor desire to see any signs of a strictly American style, others look forward with confidence to the ultimate development of such a style. "For myself," writes Mr. Cass Gilbert, of St. Paul, "I prefer the development of Art as a whole, in its larger sense, rather than the development of an American art, and do not greatly sympathise with the desire for a strictly national

art. If the architecture of our country is *beautiful and appropriate*, the question of originality will take care of itself." On the other hand, Mr. Louis H. Sullivan, of Chicago, already sees signs of an indigenous architecture, and is moved to the following dithyrambic utterance of his hopes for the future:—"It is not, for my mind, a thinkable proposition that from a people democratic and free, self-reliant, resourceful, possessed of their own bodies, possessed of their own souls, self-centred, deep of aspiration, there shall not some day breathe as an exhalation an architectural art germane to those gifts, responsive to that throbbing, eloquently voicing every form, every aspect of what is genuine in our national life." When we come to consider the road by which a truly national style is to be reached, we find the same absence of agreement. Mr. Ernest Flagg, of New York, for instance, thinks that it will be by way of the study of the true principles of design taught by "the greatest masters of the most artistic nation of Europe." "These principles," says Mr. Flagg, "are bound to take root here, because they are logical, reasonable, right and true. In time they will produce their legitimate result, and we shall have an architecture of our own." Quite otherwise thinks Mr. R. A. Cram, of Boston; in his eyes this study of French artistic methods is a mere fad; architects had better acknowledge that their art is purely self-conscious, and set themselves to use, as intelligently as they can, any of the styles of the past that can be adapted to the particular work in hand. Mr. William R. Ware, of Columbia University, writes to a somewhat similar effect: "To develop in the school a distinctive method in design, by which the style of contemporaneous building shall be influenced and controlled as the architecture of France seems to be influenced by the fashions which, from time to time, prevail in the Ecole des Beaux Arts, is by no means our object. This would be, under the circumstances, an improper and most unbecoming ambition." It was, to be sure, suggested some years ago in high quarters that the schools in this country would do well to take up and solve the problem of developing a new architectural style, which should be thoroughly national, and should express the characteristics of the twentieth century civilisation in this country. But this cry finds no echo in our minds. It is for the architects themselves, practising in their offices, to create, as they may, the architecture of the future by erecting the most sensible and beautiful buildings they can. It is the business of the schools to see to it, so far as we may, that the architects themselves have the good sense and good taste, and the self-reliance and independence of mind which shall qualify them for the this task." The book in which this discussion appears contains a catalogue of the T-square Club Exhibition, held in January and February of this year, and this is illustrated with a number of reproductions of architectural drawings; many of these reveal plainly enough the strong French influence which is variously regarded as the strength and the weakness of present-day American architecture. On the merits of the question under discussion we, as mere outsiders, do not presume to pronounce; it may, however, be regarded as certain that if ever a distinctively American architecture is to come to light—or, as Mr. Sullivan would prefer to say, "breathe like an exhalation"—it will not be by conscious striving after a new style. An unaffected style that is the result of conscious effort is almost a contradiction in terms. A new style will be produced, if at all, as the old styles were produced—by a gradual evolutionary process, arising naturally out of climatic conditions, the character of building materials available, and the habits, needs, and traditions of the people.

H. B. P.

## On Reflection.

### Endowing Scientific Teaching.

MR. ANDREW CARNEGIE'S gift of £50,000 towards

the endowment of the proposed Birmingham University is announced almost simultaneously with the report that he is engaged in furthering a gigantic scheme for creating a practical monopoly which is to absorb the leading iron and steel interests of England, Scotland, and Wales. The coincidence will suggest to many minds reflections on the accumulation of wealth and the disposal thereof with which we are not now concerned. There is one aspect of the matter, however, which should have a special interest for builders and engineers. Mr. Carnegie's gift is subject to the condition that the projected university institute degrees in science as well as classics. He is convinced of the great advantage in commercial life—especially in the iron and steel trades, with which he himself is connected—of a high degree of scientific knowledge, and he thinks that if Britain is to remain one of the principal manufacturing nations she must do something to cultivate a class corresponding to the scientific experts who manage every department of the great manufacturing concerns in America. There is no doubt that we in England have fallen behind some of our rivals in the matter of scientific training, and we are beginning to suffer for it. We do not wish to underrate the value of classical culture, but those who are to be the future captains of industry must—if we are to maintain our commercial supremacy—be willing to specialize on scientific lines, and must have increased facilities afforded them for doing so. We need not fly into a panic because a few locomotives for British railways are being made in America; but on the other hand it is mere folly to ignore the great advances that Germany and America have been making in the higher departments of commercial education. These efforts call for corresponding efforts on our part if we would not be left behind in the race. Of course we are not exactly standing still, but it is well to remember that in all matters educational we in England have a great lee-way to make up. Mr. Carnegie's generous gift will be an appreciable help in the right direction, and as barely £20,000 are now required to complete the endowment fund, there is every hope that we shall see before many years the establishment of a great midland university, which, while affording ample opportunities for the pursuit of learning in the more academic sense, will have a closer and more practical relationship with the actualities of modern commercial life than has ever existed in the case of the older foundations.

### "Serious and Wilful Misconduct."

THIS is a phrase which appears to stand in great need of legal definition. By the Workmen's Compensation Act, 1897, a workman who is injured by an accident is not entitled to compensation if the accident was due to his own "serious and wilful misconduct." But considerable diversity appears to exist in the interpretation of this phrase, which gives rise to frequent argument in the Courts. A case occurred recently in Scotland, in which the Court of Session allowed compensation amounting to 15s. per week for life to a man who had met with an accident as a result of a breach of a statutory rule under the Coal Mines Regulation Act, for which he was liable for three months' imprisonment.

It is true that the workman appeared to be unaware of the rule (he admitted having seen the rules, though he had not taken the trouble to read them), but it has long been held—we believe—as a maxim in English law that illegal acts are not to be excused on the ground of ignorance of the law. The ordinary man may be disposed to ask if an illegal act punishable by three months' imprisonment is not "serious and wilful misconduct," what is? A firm of Edinburgh solicitors have written to Mr. Chamberlain, calling his attention to this case and asking whether he has any suggestion to make as to an amendment to the Act defining "serious and wilful misconduct." Mr. Chamberlain's reply was to the effect that in his opinion the decision of the court was a wrong one, but that this might be righted on appeal. From this reply it would appear that Mr. Chamberlain is imperfectly posted in the provisions of his own Act; one of the sections of which excludes Scotland from the right to appeal in cases of this kind. This, as Mr. Chamberlain's correspondents point out in a second letter, makes a definition of the doubtful phrase even more necessary. It is, of course, possible that the decision of the Scottish Court was influenced by other circumstances, to which the correspondence makes no reference. But on the face of it, it would appear that, in view of this decision, the workman's personal culpability is a factor that may, for practical purposes, be ignored. That can hardly be the intention of the Act, for if so, why mention "serious and wilful misconduct" at all? It is to the interest of both masters and men that litigation under the Act should be reduced to a minimum, and this end would be greatly served by a clear explanation of the meaning intended to be conveyed by this apparently simple phrase.

### The Future of Regent Street.

THE views of an American architect on the street architecture of London cannot fail to be interesting, and we are pleased to find that Mr. Samuel Howe, leaving for awhile the engrossing pursuit of harassing Sir William Richmond, has been giving his opinion on the architecture of Regent Street. That thoroughfare Mr. Howe regards as "the one serious claim London had as a city on academic lines and principles to rank with the capitals of Europe." London has been built in such a haphazard fashion that it is scarcely to be expected that its street architecture should commend itself to one accustomed to the regularity of American cities. Still, Mr. Howe writes in a very tolerant vein; he recognises the real merit of the work of John Nash, the architect who laid out Regent Street in the early years of the present century. Even the fact that most of that work was carried out in stucco cannot make Regent Street contemptible. Mr. Howe's main suggestion—and in this we heartily agree with him—is that in the rebuilding of many of the houses, which is now going on and will be continued as the leases fall in, the architectural character of the frontages should be preserved. Mr. Howe suggests a possible arrangement between the tenants and the Crown (to whom this part of the metropolis belongs) whereby the latter should control the frontages throughout the street, while the tenants should be free to arrange the interiors to meet their own requirements. Whether this is possible or not it is to be hoped that the distinctive architectural character of Regent Street will not be sacrificed to the very natural desire for substantial fabrics and modern conveniences. Nash was not a genius, perhaps, like Wren or Inigo Jones, but his work had a distinction of its own and deserves to be preserved.

# ARCHITECTURE AT THE ROYAL ACADEMY.

[SECOND NOTICE.]

BY OUR SPECIAL REPRESENTATIVE.

ILLUSTRATED BY C. E. MALLOWS.

THAT this age is not an age of art is a truism of which everyone is doubtless well tired. But the fact forces itself into one's existence at every turn, and there is no escaping its blighting influence; it is a fact which blurs the senses and dulls enthusiasm; there is no response to artistic effort, or so little that it counts for nothing. Moreover, there is no kind or sort of knowledge outside a very small minority as to what is artistic effort and what is not. Art is not understood; it is "Caviare to the General." Art to it is paint, and paint of the most insolent kind. Architecture is unknown. That fact alone would prove, if proof were needed, that the Spirit of Art encircles other worlds than ours. If this were an artistic age then architecture would be supreme in Art; no one would contemptuously call architects "mere builders," as Sir W. B. Richmond recently described them in his unfortunate defence in "The Times," or refer to architecture as a "skeleton" requiring the "flesh and blood" of decoration to bring it to rounded beauty. Such a sentiment as that would be laughed at by a schoolboy, who would not require much education to know that architecture was queen of the lesser arts of painting and sculpture, and wholly independent of them; but in this nineteenth century there is no proper order or relation in artistic things. The first is last and the last first, and all is chaos. The Architectural Room at the Academy is evidence sufficient of that. The first is last there with a vengeance, if it is anywhere at all. Architecture to-day in England is not even of sufficient account to be recognised by the president at the annual banquet! We imagine that coloured photographs of the Jubilee Procession are of far greater national importance than the new Government Buildings costing two million of money, and providing an opportunity to architects rarely given in the world's history. A more scathing criticism of the attitude of the Royal Academy of Arts towards art has surely been seldom made, and it is the more eloquent because it was silent. In the face of all this contempt of architecture in high quarters, one cannot help feeling presumptuous in daring to treat of the despised art at all, and certainly not a little discontented at being discovered in that abandoned place, the Architectural Room, taking notes. And the worst of all is that the room itself holds some justification for the treatment, and proves that architecture is not only "Caviare to the General," but to its own professors as well. It is not, therefore, with much enthusiasm we return to our subject again, especially when we are forced to believe, on a second visit, that no very high level (compared to former years) is reached after all.

However, there still remain Mr. Prior's model and Mr. Wilson's interior of Holy Trinity (illustrated in last week's BUILDERS' JOURNAL), and these alone are worth coming back to see again. So is also Mr. Stokes' domestic work, "Cold Ash, near Newbury" (1616), with its delightful plan full of artistic effect, the simple treatment of the exterior, and the excellent use of material it suggests. Mr. Wilson's "Design for Calvary, St. Bartholomew's Church, Brighton," is a vigorous charcoal drawing of a reserved and distinctive design. Mr. Wilson also sends a beautiful drawing of a "Design for a Chalice" for the same church. Another work worth seeing, too, is Mr. Christopher Whall's "West Window of Private Chapel, Douglas Castle, Lanark."

No. 1704, "Altar and Triptych for the Side Chapel, St. Leonard's, Bridgnorth," is a work of much reticence, even severity, and attracts attention by its thoughtful design and good drawing. So does 1711, a most artistic

"Design for a Font," by Ralph Knott. There is an engaging look about Mr. Horace Field's "A Farmery at Burton, Sussex" (No. 1717), which has quite the air of an old farmhouse, and is really a capital study for one. Mr. Ernest Newton is sure to be interesting and artistic in all he does, and his "House at Burley-in-Wharfedale" (No. 1731) is no exception. "The Heights, Witley," by Mr. Paxton Watson, looks much better in this drawing than in the original. The restlessness is discreetly hidden in the illustration which is a very good one.

Mr. Phillip A. Robson sends a drawing of "St. George's Church Schools, Mayfair," No. 1736, a sensible and artistic design which well expresses the purpose of the building.

"The Entrance Hall, Embley Park, Hants," by Mr. H. O. Cresswell, looks very interesting, but it is hung too high to judge properly; the same remark applies also to Messrs. Hall, Cooper and Davis's design for "North-East Angle of New College, Scarborough" (1695), a good and vigorous water-colour drawing of an excellent design. Nos. 1791 and 1825 are

good work in No. 1623, "New Screen, Ipstones, Staffordshire," and in No. 1656, "New Stables, Whitley Hall, Yorkshire."

Mr. Edward P. Warren in the "Church of Saint Martin, Bryanstone, Dorset," has a good and correct, but, nevertheless, somewhat nerveless design, carefully drawn in sympathy with the work.

No. 1735, Hull Public Library, prompts the question: Why was this accepted, and the first premiated design rejected? We could not find one redeeming quality in this exhibit, or in No. 1659, "Four Small Country Houses in Southbourne, Hants, and Freshwater, Isle of Wight," which are *amazing*! What have Hampshire and the Isle of Wight done that they should suffer in this way? No. 1629, "St. Katherine's Lodge, Regents Park, N.W." Wonderful! All real ruled lines, too. There is no ordinary "free" hand in this. In the Academic Gothic style we should say, with an accent on the "dem." But why was it allowed out of the nursery?

We cannot discover the principle which per-

FROM A DESIGN FOR A BRIDGE BY ERNEST GEORGE.

also by Messrs. Hall, Cooper and Davis. The former, "Four Houses at Scalby, Yorkshire," has nice quality; and the latter, "Houses for the Gas Company, Scarborough," is very interesting, with the open arcade on the ground floor with its pleasant treatment of bay windows.

Messrs. Niven and Wigglesworth have a design of good quality in No. 1611, "Hillington, Walton-on-Thames," with an original and effective treatment of semi-circular bay windows. The pen drawing by Mr. F. L. Griggs shows thought and artistic power.

Messrs. Wimperis and East in 1620, "Proposed Rebuilding of London Newspaper Offices," show much strength and power of design, and knowledge of the right use of material. The placing and design of the frieze of windows under the main cornice are both well cared for, and contribute in a great measure to the success of this design.

Mr. Sidney K. Greenslade in 1610, "A Street Front," has a thoughtful and original design daintily drawn. Mr. Gerald C. Horsley shows

mitted this "drawing" to be hung. Really the Academy should draw the line somewhere with these riddles—they are apt to get exasperating. We give it up, and turn for consolation to have another look at Mr. Prior's inspiring model, and being refreshed, turn to No. 1624, "Cavenham Hall, Suffolk," by Mr. A. N. Prentice; this is illustrated by a bright and clever drawing, which is nevertheless wanting in tone and repose. The design is a very interesting adaptation of seventeenth century work, wanting in cohesion and concentration of effect. There are, however, many picturesque and sketchable corners about the work, which promises well. Messrs. Rogers, Bone and Coles send designs with very nice proportions and qualities for "Pulpit and Bench End in Nave, St. Brelade's Church, Jersey."

Mr. Walter Millard contributes some pleasant works in Nos. 1668, "Residence, Black Rock, Brighton," and 1678, "New Entrance Gates and Kitchen Wing, East Malscals, Sussex." These are both designs founded more or less on precedent, yet having distinct individuality

of a serious and sober kind akin to the old work itself. Mr. F. L. Griggs illustrates both these houses in a delicate and sympathetic way.

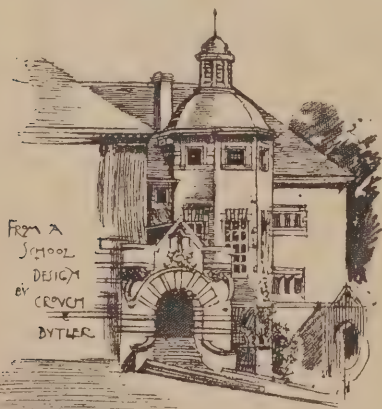

Mr. C. H. B. Quennell sends a capital illustration of an "Entrance and House in Roscroft Avenue, West Hampstead," a simple enough treatment of a Georgian type of house but illustrated in a very taking manner.

Mr. Beresford Pite, in Nos. 1850, 1851, 1852, "Houses and Shops in Harley Street and Bond Street," shows that kind of simplicity which has knowledge and power behind it,—the kind of simplicity which is the "refuge of the complex." Quite another thing is the simplicity aped in Nos. 1786 and 1784, which requires a salutary check. This kind of "simplicity" is merely a cover to ignorance. There is far too much of this kind of thing about nowadays, and it is almost as great an evil as its antithesis.

No. 1730, "Design for Boy's School, &c."!!! Another puzzle. No. 1573, "Union Church, Queen Square, Brighton," by John W. Simpson, has a well arranged plan, but the exterior is much wanting in scale, proportion, and balance of parts. The architecture is heavy and the cupolas crushing in proportion to the space beneath them. The interior shown in a dismal kind of wash drawing is not attractive, but the whole of the work would look far better, doubtless, in execution. The design for the Roedean School, by Mr. Simpson, on the contrary, is captivating, and presents quite the opposite qualities, and, although again inadequately illustrated, still shows great skill in balance and contrast of parts, and in picturesque effects.

Messrs. E. Guy Dawber and Whitwell send in 1653—"Village Post Office, Broadway, Worcestershire"—a design quite in harmony with the rest of the work in that delightful village, and we cannot give higher praise than that. Broadway is fortunate with its architects, who doubtless felt the responsibility to the full of having to touch such a lovely old village street as this.

No. 1655, "Clock Tower and Campanile, St. Michael's College, Tenbury;" 1626, "King's Corner, Biddenham;" 1709, "St. Matthew's Church, Willesden;" 1685, "Tower, St. Andrew's Church, Bedford," and others are contributed by Messrs. C. E. Mallows and Grocock; and No. 1651, "New Higher Grade School, Aston, Birmingham," by Messrs. Crouch and Butler, of that town is an effective and expressive school design. Messrs. Brewell and Baily send a

AT THE ROYAL ACADEMY, 1899.

House at Aspley Heath and a Presbyterian Church at Nottingham, both good designs, the latter illustrated by Mr. Raffles Davison, whose work contributes greatly to the interest and value of the exhibition, and who rarely misses making a picture even out of the most uncompromising material.

A monument to the late Dr. von Stephan, the first Postmaster-General of the German Empire, has been erected in the Dome Hall of the Berlin Postal Museum. It was unveiled on May 1st.

## BRADFORD'S NEW PUBLIC HALL.

### NOTES ON THE COMPETITION.

THE competition for the Cartwright Memorial Hall and Art Gallery, presented to the City of Bradford by the Right Hon. Lord Masham, has now been decided, and the whole of the designs sent in were thrown open to public inspection at the Bradford Technical College, on Monday, May 8th, and were on view for the remainder of that week.

The Corporation are to be complimented upon the fair and open way in which they have conducted this matter, which forms such a complete contrast to the manner in which the recent competition for the new fire station was conducted. Furthermore, it is generally agreed by those who have had an opportunity of seeing and are competent to judge the merits of the designs submitted, that the first premiated set fully deserves the distinction of being selected for execution.

In the conditions issued to competitors the committee, acting under the advice of their assessor, Mr. Alfred Waterhouse, R.A., removed the restrictive suggestions originally made as to dimensions and arrangement of rooms so as to afford more scope to the competitors in the preparation of designs, and agreed to judge on their merits designs submitted upon other lines, a plan which we venture to think might be more frequently adopted with beneficial results.

The particulars issued as to accommodation required, amongst minor conveniences, a large refreshment room, kitchen, &c., with a museum on the ground floor, and art galleries, capable of being used as a suite of entertainment rooms, on the first floor; and it was suggested that the design should be broad and dignified, rather than ornate, and Classical or Renaissance in style.

The site, a magnificent one situated in Lister Park, is at present partly occupied by an old and dilapidated mansion, which is to be removed, and a design for laying out the ground immediately surrounding the Memorial Hall, including carriage approaches, was required to be submitted by each competitor; the cost of this work, however, was not required to be included in the £38,000 to be expended upon the Memorial Hall.

This competition therefore provided a singularly good opportunity for architectural treatment. That it was readily appreciated by the profession at large is proved by the enormous number of designs received—117 in all; the competitors included architects from Ireland and the United States of America, as well as from all parts of Great Britain.

The chief guiding principles to be observed in a building of this character are that the entrances shall be important and direct, and that each apartment of the museum and galleries shall communicate in a continuous line, so that visitors may circulate freely through the galleries in one direction.

This principle has been admirably exemplified in many of the designs submitted, the accommodation given for museum and gallery purposes far exceeding in many instances that provided by the premiated designs; other minor arrangements, however, which are so necessary and important in a building of this nature, are by no means so well worked out, and Messrs. Simpson and Allen are to be congratulated on having produced a thoroughly artistic and dignified plan, which will be found to provide for the practical working necessities in a convenient manner, with as much museum and gallery accommodation as the Corporation should desire for the outlay contemplated. The authors place their central hall immediately opposite the main entrance, with a semi-circular apsidal treatment, two storeys in height; it is flanked upon either side by staircases, which give access to the first floor. The cloak rooms adjoining the principal entrance are particularly well arranged. Each side of the building upon the ground

floor is occupied by museums, connected by capacious corridor.

The kitchen, with scullery attached, placed in the basement, with service lifts a service-room adjoining the banqueting hall on the first floor. It is therefore available for important banquets as well as general use in connection with the refreshment-room which occupies a position at the south-east angle. The steps at the back of the building

AT THE ROYAL ACADEMY, 1899.

leading to the subsidiary entrances appear somewhat awkwardly arranged on plan, but the service entrance and picture entrance are admirably contrived. The ladies' and gentlemen's lavatory, for use in connection with the grounds, are well placed on the west side. The lighting of the whole suite of galleries on the first floor is by double top lights, of the system, as the authors' report naively remarks, "recommended by the late Sir John Millais, P.R.A. It has been already adopted by the Corporation of Worcester, whose galleries have received the unanimous approval of the artists exhibiting there, and by the Corporation of Glasgow for their new galleries now building." The central hall is, however, lighted by high North windows, this being by far preferable to a direct top light for sculpture, as well as giving a finer internal effect.

The total picture-hanging area is 6,948 ft. super, and the floor space of museum galleries 4,806 ft. super.

The authors cube out their building above ground floor at 571'49½ cubic feet, and below at 219'233 cubic feet, which they price at 1s. 0½d. and 8d. respectively, giving a total estimated expenditure of £37,073.

The new building will occasion a complete rearrangement of the grounds in the vicinity of the Memorial Hall. The whole of the land lying between the hall and the statue of St. Titus Salt will be set out for the purposes of the band. In line with the statue and the central axis of the building will be placed a band stand, with a space round for those who choose to sit and listen to the music. Outside this area will be promenades. On the west side the land will require to be lowered by from 5 ft. to 8 ft., and on the edge of the higher ground it is proposed to construct a terrace to command a good view over the visitors promenading below. The conservatories will have to be removed from their present site, and it is proposed to reconstruct them in a line parallel with the axis of the building, and with one end almost opposite the approach from Selborne Terrace.

The external treatment of the building is a type of free Renaissance, with the carriage porch taken up two stories, forming a balcony at the first floor level, entered from the reception hall. Above it is crowned with a lantern and cupola. The defects in the design of the south front, which the authors will probably see their way to overcome in execution, are the manner in which the windows of the ground floor cut through the pedestals of their order, and the somewhat flimsy decorative treatment over the heads of these same windows; otherwise it appears well balanced and composed.

The architects are prepared to commence the work at an early date, and it is calculated

that about a couple of years will elapse before the building is complete. Mr. Cox, the Bradford city surveyor, had a consultation with the architects in London on Friday, the 5th inst., and it was arranged that one of the partners of the firm should visit Bradford in the following week to confer with the committee.

The second premiated design, No. 70, is by Mr. A. R. Jemmett, who cubes his building out at 649,041 cubic feet, which, priced at 1s., gives £32,452. The author places his museum on the north side, with two smaller apartments at the South-East and South-West angles, the central hall being mid-way between them. Shelters are placed on the east and west sides, while a luncheon and grill room and tea room are placed on either side of the entrance hall on the north front. The central hall is lighted from the top and has a gallery round it. The galleries are not so well arranged for receptions, and the plan generally is complicated, and lacks that simplicity and directness which is the charm of the first premiated design. This description applies somewhat to the architectural treatment of the exterior, with its arched ground storey, figures above, and the broken lines of the roofs, which display the skylights to light the art galleries.

The interior is arranged with good effects of vista, and the entrance from the south front with the staircase at the end of the central hall and statue of Cartwright in niche above, remind one forcibly of the Natural History Museum, Kensington.

No. 44, by Messrs. Wm. A. Pite and R. S. Balfour, the third premiated design, is on rather different lines from the two other premiated designs, inasmuch as the main axis of the central hall is at right angles to the north and south axis of the building. In addition to the south entrance important entrances are provided on the east and west sides; the principal staircase is placed at the east end of the central hall. The entire north side of the ground floor is occupied by a spacious museum divided into three portions with another annexe at the S.E. angle. The auditorium is placed in a corresponding position at the S.W. angle. Cloak rooms are well placed, though not so well worked out in detail as by other competitors. The art galleries are placed over the museum, and the reception rooms arranged *en suite* on the south front; no gallery is provided to the hall.

The elevations are treated in a dignified manner with an order and rustications, the south front being divided into a centre and wings upon either side.

Of the remaining 114 designs much may be said; an exceptionally good average has been maintained, few are radically bad, many are good, and a few run the second and third premiated very close, though we cannot say they are superior to either of the latter, and they are distinctly inferior in arrangement to the first premiated design.

No. 24, Messrs. Lanchester, Stewart, and Pickards, place their principal entrance on the south front, with an entrance on the west side for festive occasions; the central is treated with columns and gallery over, while the museum occupies the north and east sides of the ground floor. Ladies' and gentlemen's cloak-rooms adjoin the side entrance. The galleries are placed over the museum, and the reception-rooms on the south and east fronts. The external treatment is severe, and requires fitting together. They cube their building at 10d. and 8d.

Mr. T. S. Gibson, No. 5, places his refreshment room upon the ground floor with service room, and gives two side entrances. The hall placed north and south cloak rooms in good position, but require amplifying; the galleries are well arranged with the reception rooms on the first floor. The external treatment is of the character usually adopted by this architect, the south front having rusticated basement, wings and central feature, the latter forming an apsidal porch with a statue of Cartwright.

No. 35, by Mr. S. B. Russell, London, hung (joining that of his late partner Mr. Gibson), plays in the external architecture the same style and feeling. The central hall is, however, placed east and west with staircases at either

end leading to an intercommunicating gallery. The reception rooms are on the south front. Cloak room accommodation is well-arranged and worked out; no light is, however, provided for the workshop which occupies a position in the basement beneath the central hall. The entrance for pictures is through the shelter, and the passages in the basement would be dark. Drawings are good, but exception must be taken to the grotesque porch on the south elevation.

No. 9, by Mr. A. D. Sharp, London, shows a central hall with columns and pilasters supporting gallery at first floor level; the plan requires, however, a great deal more working out.

No. 11, by Messrs. H. and E. Martin, of Bradford, gives a central hall entered from the south front, with staircase on the north. No. 38, Mr. J. Hatchard Smith, London, shows a large undivided area for museum purposes on ground floor; the staircase, however, appears poor for the buildings; service stairs adjoin the side entrance, large refreshment room is provided in basement, but the cloak room accommodation is ill considered. The external treatment is columnar, with rusticated and pedimented windows on the ground floor.

No. 78, by Mr. A. Brunnell Thomas, shows a good external treatment, with rusticated pilaster windows in between an order of pilasters; the sculpture is very well drawn, and the plan shows a central hall placed east and west, with central and side entrance. The museum galleries are well arranged, and the first floor is better arranged for art exhibitions than for reception purposes. The cloak rooms are badly arranged.

No. 34, by Messrs. Allen and Shields, shows centre and side entrance, and a curator's private entrance; the galleries are well arranged for exhibitions, though the lavatory accommodation is both ill arranged and ill considered. They provide a good central hall.

No. 15, by Mr. H. R. Appelbee, London, shows a refreshment room on the ground floor with a good north museum and circular drive. Mr. J. Coates Carter, No. 16, has sacrificed his museum for the entrance and central floor space, which, however, he has incommoded with columns and pillars; he has given a huge staircase and a curious triangular porte cochère. The shelter is no less than 34ft. from front to back. Elevations are monumental.

Messrs. Graham, Nicholas and H. E. Kirby show a dignified, though somewhat domesticated, external treatment. The plan is palatial and appears somewhat costly. The minor accessories are unfortunately not well arranged.

No. 16, Messrs. John Sutcliffe and Laurence Buck, of Chicago, U.S.A., shows a large hall and palatial staircase; the plan is generally well-arranged for museum and gallery purposes. No. 42, Mr. A. J. Rowley, of Oxford, shows a well-arranged plan with connected museum and galleries; the elevations, however, are inferior.

No. 23, Mr. J. W. Stonhold, London, shows a central hall dividing museum into two portions, the kitchen is on the ground floor, staircase poor and first floor indifferently arranged with mediocre elevations.

No. 25 appears to be an alternative scheme by Mr. Coates Carter, of Cardiff, with a circular central hall and a circular external staircase to first floor on the south front. Messrs. Cheston and Perkin, London, send a good set of plans, No. 27, with museum and galleries well connected together, good elevations, rusticated basement with circular windows and a range of rusticated and pedimented columnar windows on the ground floor with central loggia and circular pedimented wings, a very careful set of drawings. No. 31, by Mr. W. P. Sanders, Bristol, shows an ill-arranged refreshment room. No. 21, by Messrs. Battery and Birds, gives a museum divided into back and front portions with the porter's room at the side, but the plan is bad in respect of the arrangement of refreshment rooms.

No. 45, by Mr. G. C. Lawrence, Bristol, shows an octagonal central hall, 40ft. by 40ft., rather cramped staircases, and lofty domical treatment over hall with windows in the drum. Nos. 46 and 47 are both out of the running.

No. 48, by Mr. Jas. Cook, of Liverpool, shows a monumental architectural treatment, with the museum better arranged than the art galleries, which are too disconnected; these drawings appear curiously like No. 25 in manner of finish. No. 49 is a very poor plan. No. 50, by Messrs. John Kelly and Son, of Liverpool, shows a square central hall carried up as an external feature in the elevation, with groups of statuary on the angles, which are canted to provide space for same. No. 51, Mr. Thompson James, of Leeds, shows a bold architectural treatment with large museum accommodation, but defective in other respects. No. 52, Messrs. Thos. Worthington and Sons, of Manchester, shows a very good elevation and well worked out plan, with the mayor's parlour between reception hall and banqueting hall. No. 53, Messrs. Alfred Cox and F. S. Clapham, shows a severely monumental architectural treatment, which we fear would look heavy and ponderous in execution; the plan has good points and bears great similarity to No. 52.

No. 54, Messrs. Scott and Scott, of Drogheda, shows the kitchen on the ground floor, and gallery plan defective, architectural treatment severe.

No. 116, Mr. H. Heathcote Statham, London, shows a monumental south elevation with good internal vistas, front principal entrance and side entrances, with the staircase at one side of centre hall, reception rooms well arranged. No. 106, Mr. Thos. Davison, London, sends a well-arranged plan, with the exception of the cloak rooms, and monumental elevation in good style. No. 107, by Mr. J. G. D. Armstrong, of Tunbridge Wells, and No. 84, by Mr. F. Anderson, London, show rectangular central hall and two octagonal halls on first floor.

## ROUND TOWERS OF IRELAND.\*

By ANTHONY SCOTT.

IN selecting the subject of the present paper, I have been actuated by a desire to reopen for controversy a subject which appears to have lain practically dormant for at least some time past. The subject of the "Round Towers of Ireland" is one that would fill a fair-sized volume. It presents dimensions and outlines far too wide for the scope of a single paper. To trace clearly even in outline, to compress, and at the same time try to elucidate many of the absurd theories put forward, would be simply impossible. However, I shall try, even imperfectly, to describe the buildings as I found them, and compare them with the theories of learned gentlemen who have devoted some time and study to the question, so far as these theories, &c., are applicable to them. The question is one well worthy the attention of the learned antiquarian and the scholar. It seems to me a pity that any doubt should exist on the subject, and I fail to see a just reason for doubt, in face of the fact that the dates of the erection of some at least of the towers are recorded in the "Annals of the Four Masters," a work admitted by historians of all shades of thought in the kingdom and in Europe to be the most respected, reliable and truthful record of events in Europe to-day. To assert that the round towers are the "Conquerors of Time" is to express a very great fallacy. At the present day we have about half the number standing of which history gives us a record, and these are in different stages of dilapidation and decay, and they also are bound to perish and pass away with the conquering hand of Time. It is true that a fair number of the towers still lift their heads in sublime grandeur to-day, thanks to the fostering care of some private gentlemen, our antiquarian societies, and in later years the Government of the country, who have with praiseworthy zeal at last come to the rescue of our ancient monuments. The period at which the towers were erected appears to be the real bone of contention, and it is to this I would particularly ask your

\* A paper read before the Society of Architects on Thursday, April 27th.

OAKWELL HALL, YORKSHIRE: ENTRANCE FRONT. SKETCHED BY JAMES PARISH.

special attention. The object for which they were designed and erected appears to me to be the only other question requiring further elucidation than it has already obtained.

#### Diversity of Opinion.

In the early part of the present century the question of the origin and uses of the Round Towers received very considerable attention, and was very well handled by several parties holding diverse views on the subject. Tons of paper and barrels of ink have been wasted upon the subject by men, many of whom were very learned authors and painstaking historians, but who lacked an intimate knowledge of the Gaelic race and language and the rise and development of Ancient Irish Architecture, or the primitive Architecture of European or Asiatic countries. It has, with these writers, generally been the case of one commenting upon another in successive stages, combatting the views of their neighbours and predecessors while trying to advance their own notions on the subject, demolishing one house of cards to erect another on its ruins.

#### Action of the Royal Irish Academy

So distracting, absurd, and confusing were the expressed opinions of every writer on this subject of Irish antiquities in the early part of the present century, that the Royal Irish Academy (one of the most distinguished and learned bodies of antiquaries in Europe) offered a gold medal and prize of £50 for the best essay on the "Origin and Uses of the Round Towers of Ireland." A clause in the conditions of the competition made it incumbent on competitors to make a careful survey of at least a large number of the then existing remains of the Round Towers, and at the same time to make a careful comparative analysis of the masonry of the Towers, and the masonry

of the ecclesiastical buildings always found in connection with or adjacent to the Towers. It was then for the first time in the history of the controversy that the subject was taken in hand in a practical way by a practical and educated man, and one who by the glorious record which he has left us in his writings, has proved to the world his fitness for the work which he undertook to do.

#### Dr. Petrie's Work.

George Petrie, LL.D., R.H.A., V.P.R.I.A., it was, who, for the first time in Irish history, cleared away the accumulated rubbish of ages, with which time had surrounded the Round Towers. Under the influence of his pen and his brain, the mists, the doubts, and legendary romance that had up to that time enshrouded the Round Towers of Ireland were lifted and cleared away for ever. The Royal Irish Academy, in 1833, after careful study and consideration, unanimously voted Dr. Petrie the Gold Medal and Prize of £50, which he richly merited. Dr. Petrie having been engaged on the Ordnance Survey of Ireland, under Colonel Sir Thomas Larcom, enjoyed peculiar facilities for prosecuting his inquiries and research. Sir Thomas Larcom, R.E., Superintendent of the Ordnance Survey, gave him every possible facility, encouragement, and assistance while engaged on the work, and in the elucidation of Ancient Irish Manuscript Documents he has had the assistance of the two best Irish scholars of the century, John O'Donovan and Eugene O'Curry, also fellow-workers on the Ordnance Survey. In addition to the above-named advantages, Dr. Petrie had free access to and made close examination of the Ancient Irish Manuscripts and other kindred documents of historical interest, preserved in the British Museum, Trinity College, Dublin, the Royal Irish Academy, and the Arms Office, Dublin Castle, and everywhere else in the country where documents of the kind had been stored and preserved.

#### Scarcity of Irish MSS.

It is greatly to be deplored that the documentary treasures mentioned fall far short of the number of manuscripts which might have been preserved, and that because of the wanton and deliberate destruction of such documents by Government officials of bygone days. As regards the destruction of Irish Manuscripts, I take the following quotation from Mr. Joseph Salmon's valuable essay on the Round Towers, published in Belfast in 1886: "The policy which the representatives of English rule in Ireland pursued towards the Welsh Manuscripts, they enforced against the Irish, also visiting our native records with every species of hostility." Dr. Rothe, Bishop of Ossory, in James the First's reign, testifies in his "Amacleta" (p. 342) that when the alien authorities became aware of a MS. History being in the hands of a private person it was immediately begged or bought, or threats were employed to obtain possession of it, if other means failed, so that a man's life was endangered by resistance to their will. He names Sir George Carrew, Governor of Munster and author of the famous work, "Pacata Hibernia," as guilty of notorious

robberies and ravages thus committed upon written records. The destruction which this man wrought in a single province among our ancient memorials Sir Henry Sydney and other deputies extended to the entire Kingdom, their conduct encouraging the belief that it formed part of their office to subvert every trace of antiquity in the country (p. 343).

#### Wanton Destruction.

Dr. Lynch avers ("Cambrensis Eversus," Vol. I., p. 337) that wherever Elizabeth's troops were quartered they rifled the houses of friends and foes indiscriminately, carrying off all Irish MSS. which they could possibly lay hold of. A dearth of Irish MSS. was thus entailed to succeeding ages. An excellent Irish scholar, Dr. W. K. O'Sullivan, in his introductory volume to Eugene O'Curry's lectures, says:—"During the first part of the eighteenth century the possession of an Irish book made the owner a suspected person, and was often the cause of his ruin. In some parts of the country the tradition of the danger incurred by having Irish MSS. lived down to within my own memory, and I have seen Irish MSS. which have been buried until the writing had almost faded and margin rotted away, to avoid the danger which their discovery would entail at the visit of the local yeomanry." Numberless cases of a similar character could be given, and were it necessary for purpose of this inquiry, the most reliable English, Welsh, Scotch, German and French historians might be quoted as deploring the loss which the history of mediæval civilization has suffered

SKETCHED BY JAMES PARISH.

at the hands of official vandals in Ireland. To those causes must be attributed the mystery and uncertainty which has hung round the tower building period in Ireland. But in the early part of the present century, with the partial recognition of civil and religious liberty, a happier state of things came into existence. Such of the old Irish documents as escaped the vandalism of bygone days were unearthed with a new enthusiasm, and the contents critically investigated and translated by O'Donovan, O'Curry, Petrie, and others of lesser note.

(To be continued.)

**Bury Art Gallery and Library.**—The memorial stone of a fine building which is to be used as an art gallery and public library, was laid at Bury a short time ago. The building has been designed by Messrs. Woodhouse and Willoughby, of Manchester, and is to cost about £21,000.

**Working Men's Homes.**—At a meeting of the directors of the Burton-on-Trent Artisans' Dwellings Company, tenders were accepted for the construction of the first block of forty houses to be erected on the land the company have taken from the Marquess of Anglesey. The land, which has been acquired on favourable terms from the Marquess, will provide accommodation for 150 cottages. Mr. Thomas Jenkins, of 35, High Street, Burton-on-Trent, is the architect.

## RAMBLING SKETCHES IN YORKSHIRE.

BY HAROLD E. HENDERSON.

THE following is an account of a trip made by a party of Leeds Architectural Sketchers to places of interest in Yorkshire for the purpose of study and enjoyment. Upon reaching Calverley Station we pause before proceeding to our destination, Calverley church, to inspect Horsforth Old Hall, a very picturesque old mullioned house. Surrounded by trees it looks a quaint old-world place, a glimpse of which takes your thoughts back to the time of rapiers and periwigs, and makes you think of the good old Yorkshire gentlemen who lived and died here. The sturdy looking stable buildings, in quiet keeping with the house, are well worth noting. We then went towards the church; crossing the Aire we climb up a steep hill upon which stands the pretty village of Calverley.

The church nestling in and surrounded by trees, is a building of sandstone in almost every style from Norman to Perpendicular, and, while not boasting of elaborate detail, it attracts the eye by its simplicity and quiet dignity, which make it both interesting to the architect and picturesque to the wayfarer. It consists of nave, aisles, chancel, porch, and tower at the west end. The interior does not call for particular mention, except for the Jacobean font cover of fret-cut and carved oak, mellow with age, a good example of seventeenth century woodwork. The east window is filled with some capital stained glass; fragmentary, it is true, but the colours are there, and the jewel-like effect when the sun shines through is beautiful in the extreme.

Adjoining the church is a capital old Georgian stone house, roofed with stone slates of various colours, and coated in parts with green lichen. It is worth studying because of the rather unusual refinement of the mouldings, and because of the capital fenestration, the importance of the various stories being admirably shown by the respective importance in detail of the windows.

We then proceeded into the village, where we came upon some very picturesque cottages with large stones for the jambs, and a stone of herculean size for the head. There are also one or two capital inn-signs, in fact, many a little thing worth noting. Up one of the principal streets is the Old Hall, the ancient residence of the De Calverleys, now divided into cottages. There is some rather good oak wainscotting here of the sixteenth

century. Some parts of the Hall date back to Henry VII.'s time.

The following Saturday we visited Birstall, about seven miles south-west from Leeds, a large village, chiefly built of stone. There are plenty of small notes worth taking by the architectural explorer. The church of St. Peter, in a thickly wooded plantation, was, with the exception of the tower, entirely rebuilt in 1866. The tower, of massive and sturdy build, is said to have been erected in the eleventh century. It has angle buttresses at three of the corners with good weatherings; in the bell chamber are two windows with perpendicular tracery, which look very effective in the mass of plain stonework. The battlemented parapet is projected on stout stone corbels with pinnacles at each corner, which have been cut off at the top and replaced by a Renaissance finial. A small, circular-headed window lights the stairway.

There are several mural tablets in the tower, as well as a nicely designed font.

In the churchyard are a lot of sculptured gravestones, some of which are of praiseworthy design. Leading out of the church at the north-west corner is a very nice Lych Gate, roofed with large stone slabs. Near the church is a very picturesque inn, built of stone and rough casted, with a simple, wrought iron projecting sign, a style of inn which is slowly dying out to make way for the gin palace style—red brick and plate glass, with a "little" ornament.

Kiddall Hall, near Barwick in Elmet, was then visited. The present resident, a jovial farmer, heartily gave us leave to sketch and examine the splendid old hall, in which it was his fortune to live. The house, of mellow-tinted sandstone, is covered with beautiful stone slates. It was anciently called Kidd Hall, and was the home of the Ellis family who came here in the twelfth century. It has as usual its romance and its ghost; tradition says it is haunted by one of the Ellises, who was killed by the Parliamentarians in the civil war.

There are inside the hall some very nice oak panelling and chimney pieces of the sixteenth century. But perhaps the chief point of interest in this fine old manor house is the beautiful bay window added in the fifteenth century. It looks as if it had been taken from some other position and planted in its present position; very likely it was a window taken from the chapel which has now disappeared.

It is filled with diamond panes with painted glass shields, containing armorial bearings. A Latin motto runs round the parapet, and above this is a battlemented parapet with crocketed pinnacles; the frieze is adorned with a trailing pattern of vine leaves very conventionally treated. Next to the large bay window is a large timber gable of extraordinarily massive timbers, but now almost covered with ivy. On the east side of the

house is a very beautiful bay window, long and low, with splayed mullions and roofed with stone in graduated splayed courses. Note may be made of the clever way the cornice of the bay window is mitred with the string course of the house which is on a higher level than the bay cornices. In fact, the house is full of practical suggestions like this.

The stable buildings are very fine; the barn especially is interesting, because of the massive timbers reaching up into the blackness of the roof above. I cannot tell why the architectural students do not sketch and study these beautiful manor farms and cottages more than they do, for some great and useful lessons can be learnt from them. They would do well to notice the honest, straightforward and simple way in which difficulties are got over, the solid looking chimneys suggestive of the cosy ingle nook inside, the masterly breadth of wall surface, and finely proportioned door and window openings, and try and embody these features in their own designs.

Our next visit was to Oakwell Hall, near Birstall, another typical Yorkshire house. Set back about 50ft. from the road, and surrounded by a low wall inclosing the garden of holly trees and firs with hollyhocks and old world looking flowers, with its narrow path to the porch of diamond set stone flagging, it makes a fascinating picture of homely life and comfort. Entering the porch with its stone seat and ceiling enriched with a diamond-shaped piece of capital ornamental plaster work, we pass through the iron-studded and heavy-looking oak door into the spacious vestibule of delicately yellow-washed walls, and from thence into the hall.

This fine room is panelled on all sides with oak, and goes up two stories, with ornamental plaster ceiling, and music galleries on either side. The large window of thirty lights is filled with diamond panes, with lead 1in. thick, and nicely designed casement fasteners. There are 2,000 diamond panes in this window. In one corner of the hall is the staircase, which winds upwards to the galleries, and is inclosed and shut off by a small dog-gate—a feature very seldom seen now, its use being to keep the dogs from climbing the stairs. The school-room is also a fine room, being panelled up to the ceiling. The chimney-piece is of stone, with oak overmantel.

At the back of the house, and shut in with high walls, is the well-kept lawn, looking fresh and green in the sunlight. The mullioned windows, filled with small panes, are well placed and nicely proportioned. The projecting chimneys are very nice also, being massive, with nicely designed weatherings placed in the proper spots. Oakwell Hall is the original of "Fieldhead," in Charlotte Brontë's "Shirley," and is much visited in consequence. The old moat is still to be seen, filled with green-looking water, the home of the toad and water rat.

KIDDALL HALL, YORKSHIRE. SKETCHED BY H. SIDNEY RHODES.

## OUR COMPETITION.

### EXTENSION OF TIME.

IN response to the request of several intending competitors who desire further time for the preparation of their designs for a Country House, we have decided to extend the time allowed for sending in designs to **Wednesday, June 7th**. Those who intend to compete, however, must intimate to us their intention to do so not later than **ten days before** the Competition closes. Full details as to the conditions of the competition, in which premiums amounting to **Thirty-four Guineas** are offered for the three best designs, appear on p. 200 of last week's BUILDERS' JOURNAL AND ARCHITECTURAL RECORD.

## Correspondence.

### FITTING UP AND SANITATION OF COWHOUSES.

To the Editor of THE BUILDERS' JOURNAL.  
LONDON, W.C.

DEAR SIR,—In your issue of May 3rd, your correspondent, Mr. S. S. Platt, gives a reference to "Specification," No. 3, page 249. Concerning this matter may we be allowed to point out that other information upon cow-houses appears on pages 29, 285, 291, 294, and 295 of this, the current number.—Yours faithfully,

The EDITORS of "SPECIFICATION."

### REGISTRATION OF ARCHITECTS.

To the Editor of THE BUILDERS' JOURNAL.  
SWANSEA.

DEAR SIR,—In your issue of May 3rd, under the heading of "The Registration of Architects," the following occurs: "Some fourteen years ago the Society of Architects was instrumental in framing and introducing into Parliament a bill for the registration of architects, which has passed its first reading." I should like to know through your paper the date when the bill passed its first reading.—Yours faithfully,

CHAS. S. THOMAS.

[This question is answered in the letter from Mr. C. McArthur Butler, which appears below.—Ed. B.J.]

To the Editor of THE BUILDERS' JOURNAL.  
ST. JAMES'S HALL, PICCADILLY, W.

DEAR SIR,—Your correspondent "Architect" closes his excellent letter in last week's BUILDERS' JOURNAL with a suggestion which would tend to show that he has not made himself familiar with the efforts which have been put forth to protect the interests of the profession, or he would have known that there is already an organization such as he suggests, viz., the Registration Bill Committee, which was formed at an open meeting of architects at Freemason's Tavern, in April, 1886. But with a view to affording further information as to the attitude of the profession generally on this important subject of registration, it may be of interest to note what the Royal Institute of British Architects—that body which the average man would expect to see first in the field in any movement of this kind—has done in the matter. Some forty years ago, the Council of the R.I.B.A. passed a resolution to the following effect: "The question of instituting an examination has already been discussed at meetings of this institute, and the council do not profess to do more than recommend the initiation of a scheme to be cautiously and gradually developed and brought into working order, in which too much should not be attempted at the onset, but which in accordance with the rule now established in other professions, the ultimate result should, in their opinion, be the establishment of a system of compulsory examination extended to all the architects, whether members of this institute

or not"—in fact, compulsory registration. Now, so cautiously, gradually and inconsistently, has that august body developed this scheme, as applying at least to non-members, that the only step that they appear to have taken in the matter is to strongly oppose the bill which the Registration Bill Committee was instrumental in introducing, and to which the Society of Architects is giving its support, and which is individually favoured by a large majority of members of the institute, though collectively opposed, for reasons which have been characterised as "unknown," but which are sufficiently obvious.

That it is, or should be, the duty of the older body to take the lead in registration and other questions affecting the welfare of the profession no one will deny; but as the very opposite appears to be the case, it is only natural that other interested bodies should be brought into existence who will, and who do, take up this matter and any other calculated to benefit the profession—not in opposition to the institute, rather, if possible, in co-operation with it.

Now, a society established on such lines as this, having obtained legal incorporation in the face of strenuous opposition, and increasing rapidly, as it is, in numbers and influence, claims the support of every member of the profession; and if architects are really in earnest in desiring registration, let them support the Society of Architects and the Registration Bill Committee, and by co-operating with them assist in bringing about the much to be desired State recognition of the architect.

Some may consider that little has been done in the matter of getting the bill made law, but it must be remembered that the appropriation of the time of the House of Commons by the Government, reduces the opportunity for private members to introduce bills, to the very insignificant proportion allowed by the ballot, and the bill has, as I have already stated, passed its first reading (March 7th, 1893). This, considering that it took the medical faculty (one of the first professions to recognise the desirability of compulsory registration) some thirty years to obtain their Act of Parliament, is not bad progress, especially in the face of such difficulties and obstacles as have been referred to.

I might add that a copy of the "Architects' Registration Act" may be obtained at this office, price 3d., or at the Queen's Printers', and it would be well that every architect should make himself acquainted with its provisions.—Yours faithfully,

C. MCARTHUR BUTLER.

Secretary, the Society of Architects.

To the Editor of THE BUILDERS' JOURNAL.  
RUGBY.

DEAR SIR,—I noticed with amusement the bland simplicity of your correspondent, "W. M. R.," who in your issue of the 19th prox., wrote, asking, "what are the chief advantages or disadvantages" of registration as applied to architects? Your correspondent must have been surprised that his pregnant inquiry failed at once to awaken the interest or speculation of other of our readers, for it is clear that he is quite unconscious of the keen, not to say virulent, controversy on this subject which swept the Profession not many years ago, and the bitterness of which has not yet quite disappeared. Has he never heard of the "Memorialists." Let him turn to the files of the Institute journal, the "Nineteenth Century Review," and a volume of essays by Messrs. Norman Shaw and T. G. Jackson, entitled—if I remember aright—"Is Architecture an Art or a Profession?" From these sources he may glean all that may be reasonably said on one side and the other, and a little more besides. The subject is worn out and utterly threadbare.

At the same time I can't let it drop here without telling "Architect," whose interesting letter appeared in your issue of last week, that I do not agree with him. His array of facts illustrating the popular disrepute of the profession with the public are for the most part unquestionable, and are a useful contribution to the magazines of anyone who should desire

to open a new "Profession or Art" campaign; but I for my part do not agree with his conclusions. A plumber is no more than a plumber for being registered, and the distinction, public recognition, and social prestige which some architects attain to, is even more than their deserts, being largely fictitious and sentimental. The trouble lies in the essential vulgarity and callous ignorance of the public on the subject of architecture. Hardly anyone who enters the profession ever has a chance of being an architect. The majority of the architectural work done in this country calls for no education, or culture, or refinement: it is essentially an occupation for unrefined and ignorant men. An educated and refined man could not do the great bulk of the work that is to be done, even if the pay and the social status were such as his necessities required. The average architect, in the present condition of ignorance and indifference of the public, must be an ignorant man, or he will die of disgust and humiliation. As it would be manifestly impossible to include as "architects" only those who were architects, registration would rather degrade those who now attain distinction, than distinguish those who are under the shadow of a popular disparagement.

"A POTENTIAL ARCHITECT."

To the Editor of THE BUILDERS' JOURNAL.  
WESTMINSTER.

DEAR SIR,—I agree with your correspondent "Architect" that registration is a "momentous question in regard to the profession," and that it is well that it should be freely discussed; but I am not so sure that I agree with him in advocating it. The difficulty is that architecture, as practised now, is a combination of many diverse functions, demanding from those who practice it many diverse and even opposite qualities; and as we are all very limited in our gifts and acquirements, we are all apt to lay stress on one or the other, and to have very different ideals as to the position and repute of the architect. Registration may help forward one ideal, but it may retard another. Your correspondent chiefly concerns himself with what may be called the professional ideal—not, however, altogether forgetting "that æstheticism, ever present in him whose heart is in his work"—the architect, as a professional man, comparable with the lawyer and the doctor, whose solid acquirements and professional integrity are devoted to the material and worldly needs of his client, whose appearance is respectable, whose manner is decorous, whose praise is in all the law courts. Him registration may help.

But if you consider the artistic ideal, the architect as an artist, comparable with the poet and the musician, whose natural gifts and highly-trained perceptions are devoted to the emotional and spiritual needs of humanity, whose appearance is not necessarily respectable, whose manner is possibly far from desirous, whose praise is not in the courts, but deep in the hearts of men—him registration may destroy.

Considering the successful and yet genuine architect has to realise to some extent both of these ideals, it is difficult to make up one's mind on a question which so powerfully affects them both, and that in contrary directions. But the more the matter is discussed, the sooner we shall arrive at some definite opinion, and see whether the good outweighs the evil. If so, let us have registration—and that as soon as possible; if not, let us forget all about it, and waste no more time and energy in discussing it.

From the point of view of practical politics, I fancy that a good many people are of opinion that Registration has a very poor chance so long as it is supported by the Society of Architects, and, for that reason, opposed by the R.I.B.A., and that opponents of Registration cannot therefore do better than encourage the Society to go on, confident in the successful opposition of the Institute; while supporters of the same should induce the Society to drop it, confident that the Institute would then successfully take it up, after a decent interval.—Faithfully yours,

A. R. JEMMETT.

## ASPECT AND SOIL

IN RELATION TO  
THE DWELLING-HOUSE.\*

BY V. G. POORE, F.R.C.P.

ALTHOUGH I have presumed to accept the invitation of the Architectural Society to read a paper, I hope I shall be acquitted of any desire to step outside my province and to lecture architects on matters which they obviously understand much better than I.

My excuse for addressing you must be found in the fact that, as a physician and sanitarian, I believe that of all circumstances which make for or against the health of the public the dwelling-house is most important.

## Building Conditions.

The conditions under which dwelling-houses are built have been revolutionised by steam machinery. Houses are nowadays run up in a wholesale fashion. Modern facilities as regards water supply and sewerage have made curtilage unnecessary, and have enabled us to build towers of flats, which, from the sanitarian's point of view, are most undesirable.

We all recognise that overcrowding is the greatest of social evils, whether it be regarded from the point of view of morals or health, and we all protest that it is useless to attempt to check it. Most of us, I hope, are sensible of the magic influence of the word "home." Many of us believe that the "home" and the "family" are the units out of which the greatness of a nation is constructed, and that if a nation is to continue to be imbued with feelings of true patriotism, the sacredness of the home and the sentiment of family must be maintained. I wonder if the offspring of parents who fluctuate between Capel Court and Newmarket, and whose only dwellings are West-end flats, on a three years' agreement, and rooms in hotels at fashionable resorts, has any home sentiments?

It is very doubtful if the sentiments of home and family are likely to be strengthened by the mode of life of what are known as "smart" people.

The opinion has lately been expressed by a great authority on labour questions that the industrial classes do not want "homes," and that anything which tends to fix them in one spot or to create an affection for any locality is contrary to their best interests. Labour must be organised as an army, and quick mobilisation is essential if the fight with "capital" is to be successful. There can be no doubt that public opinion is at present mainly in favour of overcrowding in cities, and further, there can be no doubt that overcrowding is encouraged both directly and indirectly by modern municipalism and the by-laws which regulate building operations.

## The Aspect.

Very little attention is paid in the present day to the aspect of a house, and it is evident that the public barely considers the question of aspect.

The speculative builder considers the question of cost and cost only, and until the public recognise that aspect has a real money value and is worth paying for, there is no likelihood that the question of aspect will trouble the mind of the builder.

It appears to me that the engineer and the surveyor have too much the "whip hand" of the architect, and that by the time the building estate has been laid out the whole question of aspect has been practically settled, and the architect has really no choice in the matter.

In the Thames valley, where I have a cottage, I have for the past twelve years watched the "development" (so-called) and the wholesale urbanising of a rural spot. This

process is a simple one, and is familiar to all of you.

1. The locality is constituted an "urban district."

2. The Council is elected for three years.

3. The Council immediately borrows a sum which works out to about £10,000 for each councillor, and thus increases all existing rents for thirty years at least.

4. The roads (main roads and by-roads) are all provided with sewers and water pipes.

5. The lands abutting on these roads suddenly change from farms and gardens to building sites.

6. These lands are bought by building societies or building speculators, and are laid out with one object, and one only, in view—i.e., the placing thereupon of the maximum number of houses which is permitted by the by-laws. This means that no house has any curtilage other than a back yard 25ft. deep.

## Beauty and Sanitation.

In "laying out" a building estate the new roads are almost invariably at right angles to or are parallel to existing roads, and it is needless to say that they are absolutely straight. Curves of beauty are scarcely permissible in modern sanitation. The result of all this is that the building estate when complete has all the regularity and symmetry of a gridiron. The houses are possibly all built to pattern. There is no individuality, no variety, no change, no rest for the eye.

The extent to which this kind of thing is carried is well exemplified in the district to which I have alluded, in which there is a "recreation ground" dating from a time anterior to the sewerage and urbanising.

This recreation ground is five acres in extent, and its northern and southern boundaries are formed by high roads, while its eastern and western boundaries are formed by market gardens, which, in consequence of the changes indicated above, have suddenly developed into building estates. One would have thought that the building speculator would have turned the fronts of his houses to overlook the recreation ground, and that by giving his houses (as he might have done) a south-easterly aspect, with the pleasant prospect of the recreation ground, he might have commanded some extra rent.

This does not appear to be the case, for the privies and wash-houses have been turned to the recreation ground, while the chief rooms of the houses look at their stuccoed twins on the other side of the street.

The recreation ground will, I suppose, remain a rather gaunt spot, hedged in by prim railings and flanked by lines of fluttering linen. The opportunity of making a pretty "village green" has been allowed to slip, and I am not aware that the Urban District Council have troubled their heads about the question.

If we are to continue to build houses in a wholesale fashion in straight rows it is almost useless to appeal to the architect on the question of aspect, although some good might be done by directing the attention of engineers and surveyors to the matter.

If we concede that the best aspect for the chief rooms of a house is one looking to the south-east, then it is obvious that if the main roads of a building estate run from south-west to north-east, the houses flanking such road would have one side turned to the south-east. On the north side of the road the fronts would face the south-east, and on the south side the backs would face the south-east, unless the Local Council permitted and the builder were willing to allow the backs of the houses on the southern side of the road to be turned to the street. Speaking as a doctor, I have no doubt that it would be advisable to turn the

## Backs to the Street,

if by so doing a good aspect can be obtained for the chief rooms. By adopting this plan we have the additional advantage of bringing the culinary and sanitary arrangements close to the street, and thereby greatly simplifying the sewerage arrangements which would result in some saving of money. It is very important from the point of view of health that food

should be stored in a cool place. Sour milk and putrid food are a great cause of infantile diarrhoea. This is an additional reason for the rule of "living rooms to the sun, larders and kitchens to the north."

I need not remind this Association that some of the finest houses in London (Hyde Park Gardens) are built with their "backs" to the street, and with the main rooms overlooking a private garden with the Park beyond. Whether houses with their backs to the street would meet with the approval of "the masses," I cannot say. A stuccoed head over the front door probably does more to let to this class of house than the fact of its rooms being exposed to the sun. If it were considered essential that the chief rooms of a house should face the south-east, there would be no difficulty in attaining this end (except in streets running from north-west to south-east), provided the houses were placed obliquely to the street line and were built *en échelon*, a mode of building which tends to secure privacy, although it probably adds to the expense of building and the difficulties of plotting out the estate.

It is evident that the laying-out of the roads on a building estate is a most important matter in relation to the aspect which the houses are to enjoy. Is it necessary that all such roads should be absolutely straight and at right angles to each other? Is it quite impossible to rest the eye and give some variety by an occasional curve? Is it any use to appeal to the ogre jerry builder on a purely æsthetic question?

The question of aspect is very much a question of sunlight, and there can be no doubt that sunlight has great influence on health. The Italians have a proverb which says "Dove non va il sole va il medico"—that the doctor comes to those places which the sun does not visit. It is an established fact that many of the microbes which are the causes of disease are killed by sunlight. This appears to be the case with regard to tuberculosis, and it is certain that there is most tuberculosis in places which are overcrowded, and to which the sun finds access with difficulty.

## Statistics.

In the supplement to the fifty-fifth annual report of the Registrar General is a table giving the annual death rate per million living among children under five years of age from tuberculosis in the ten years, 1881-1890.

By selecting the death-rate among children under five we practically exclude the disturbing influences of varied age, sex, and occupation, and we may conclude that amongst this class the influences which make for health, or the reverse, are home influences. Again, when a man selects a house, no single consideration is of more importance than the effect which his dwelling is likely to have upon his children. This table of the Registrar-General's is, therefore, one which ought to be carefully studied, and as it deals with a period of ten years it may be concluded that the statistical results arrived at are reliable.

Among children under five there is more tubercular disease in London than in any other county, and probably for the reason that the number of persons on a given area is greater in London than in any other county.

Thus the death rates from tuberculosis are in

London.....	6581	Lancashire.....	5364
Durham.....	5650	Dorsetshire.....	2401

Again, when we come to examine the death rates from tuberculosis in the different Registration districts of London we find them as follows:—

Strand.....	11,881	Kensington.....	6,571
Stepney.....	9,310	Islington.....	6,532
City.....	8,858	Whitechapel.....	6,098
Chelsea.....	8,129	Paddington.....	6,029
St. George's, Hanover Square.....	7,952	Hackney.....	5,989
St. Faviour's.....	7,839	Mill End.....	5,975
Holborn.....	7,876	St. Olave.....	5,910
Westminster.....	7,766	Lambeth.....	5,907
Shoreditch.....	7,675	Woolwich.....	5,641
Poplar.....	7,219	Wandsworth.....	5,581
St. George, E.....	7,204	Camberwell.....	5,537
St. Pancras.....	7,064	Greenwich.....	5,528
St. Giles.....	7,055	ENGLAND AS A	
Marlybone.....	6,820	WHOLE.....	4,499
Bethnal Green.....	6,988	Lewisham.....	4,018
Fulham.....	6,731	Hampstead.....	3,661

\* A paper read before the Architectural Society on May 12th.

It is a remarkable fact that in only two of the registration districts in London is the death-rate of children from tuberculosis less than it is in England as a whole. In all the other districts the death-rate from the tubercular diseases is much higher than in the country at large. Possibly some of the figures are influenced by the position of hospitals, but not to any great extent. Seeing that tubercular diseases are all chronic, and that many children are moved out of London at the first threatening, I am afraid it is impossible to conclude that the figures give an exaggerated idea as to the extent to which the malady prevails in this dark, overgrown town.

#### The Value of Sunlight.

This prevalence of tuberculosis is due to overcrowding of houses on the land and overcrowding of people in the houses, to the dirt-laden air and the darkness and the gloom.

In London, it is almost idle to talk of aspect. If aspect is mainly a question of sunlight, then in London it is not only necessary to have your house facing towards the sun, but also to make sure that no screen in the shape of a tower of flats intervene between it and the sun. To discuss the question is almost absurd. If what I have said, and the figures I have quoted, are sufficient to convince you and others that the conditions which pertain in London are to be avoided in less crowded places, a good work has been done. To have your house facing the sun, and with its chief living rooms well exposed to it, means a considerable saving of fuel and gas. I am unable to tell you what is the potential value of heat in a room facing south over and above that of a room facing north, but we must all feel sure that it is considerable. I am fond of telling people to look at the north and south sides of a garden wall. Go to the south side and bask in the brightness and warmth, feast on the peaches ripe and ruddy, and listen to the hum of insects glinting in the sunbeams. Then go to the north side, damp, all in chilling shadow, content you with a few hard pears or acid cherries, scrape off the damp mildew growing in the mortar, and sniff the fusty smell arising from the dank, sour soil.

It is idle to contend that aspect has not a most important influence on health. If a house face right and has a verandah, the occupants can often enjoy the fresh air, instead of crowding into a stuffy room.

If a dwelling be detached and isolated it is generally possible to give the chief rooms any aspect which may be desired. It is common to find, however, that detached villas have their fronts parallel to the road, even though this position should entail a north-east aspect. How far by-laws and regulations may be answerable for this state of things I do not know.

#### The Value of Detached Dwellings.

Not only on account of the freedom as regards aspect, but on the general grounds that overcrowding is to be lessened by every means in our power, it seems to me that sanitary authorities should encourage the erection of detached and isolated dwellings.

The most important part about a "home" is not the house, but the garden round it; and I have no hesitation in saying that the children of a country labourer, born in the commonest and cheapest erection of wood or mud and thatch, standing in its rood of potato ground, have a much better chance of growing up healthy in body and mind than those who have been born under the fostering care of urban district councils in houses with concrete foundations, damp-proof walls, patent water-closets and traps, sewer pipes, and rain-water pipes, with an expensive paving in front, and a tiny concreted yard behind, which is practically an air-well with putrefaction traps in its floor. This last class of dwellings, be it remembered, the outcome of by-laws which seem to be designed for the purpose of rapidly urbanising rural places, is very expensive, and the artisan finds that he has to pay, relatively, an enormous part of his earnings in rent and rates, and that his children have no private playground.

I freely admit that the stringent building

by-laws which are now in force in many places are very necessary in crowded centres of population; and if they were still more strict on the question of height and relation to be enforced between the cubic contents of the building and its surroundings, I, for one, should not object. On the other hand, it must be remembered that these by-laws very much augment the cost of building, and that it is becoming increasingly difficult to get an adequate return for houses erected for the wage-earning class. So much is this the case that it seems not unlikely that municipalities will be called upon to provide dwellings, and run them at the expense of the ratepayers as a whole.

Many rural municipalities have adopted these by-laws and appear to me to enforce them very often to the detriment rather than the advantage of the locality. A little town in Hampshire, which I know well, includes within its official boundaries places which are three or four miles from the town hall, places which are in the wilds and as thinly populated as Sahara. And yet this municipality enforces its by-laws so that the farmers and gentry of these outlying spots are obliged to submit plans of even outhouses or ovens which they are proposing to erect, to the collection of tradesmen who happen to constitute the Council for the time being.

I am very strongly of opinion that the builder of an isolated dwelling ought to be allowed to escape from these

#### Harassing By-laws,

and ought to be permitted greater freedom in the choice of building materials and in other matter than the speculator who is trying his hardest to put the maximum population on the minimum legal area. In relation to fire and infectious disease the surest preventive measure is the isolation of the dwelling. If the dwelling be separated from the boundaries of other premises and the public thoroughfare by a distance equal to its height (i.e., the distance from the ground to the top of the highest chimney or gable) it ought to be allowed to escape from the by-laws. I need hardly say that the insurance offices will know how to enforce an adequate security against fire. Mr. Till, of Eynsford, in Kent, recently erected two timber cottages in the country on either side of a road. One of these cottages was condemned because it happened to be within the boundary of a Council which had adopted model by-laws. The only valid reason for such condemnation was the danger of fire. But it is evident that the danger of loss of life from fire is very slight in an isolated cottage with the bedroom windows some 10ft. at most above the ground. On the other hand, the danger to loss of property is indicated by the fact that the insurance offices charge 2s. 6d. per cent. instead of 1s. 6d. If, however, a model by-law cottage costs £250 while a wooden cottage equally large and wholesome costs £150, it is evident that the cost of insurance is equal in the two cases. The rent of the first at 5 per cent. would be £12 10s., and the rent of the second £7 10s. If the local charges (rates) be 4s. in the pound then we have as the annual cost of these

#### Two Cottages:

Model By-law Cottage.				Wooden Cottage.			
	£	s.	d.		£	s.	d.
Rent ... ..	12	10	0	Rent ... ..	7	10	0
Rates ... ..	2	10	0	Rates ... ..	1	10	0
Insurance ... ..	0	3	9	Insurance ... ..	0	3	9
Total ... ..	£15	3	9	Total ... ..	£9	3	9

By living in a wooden cottage the working man would save £6 a year, or nearly 2s. 4d. a week. And if he had a rood of ground the produce will be worth at least £12, which will leave him with nearly £3 in pocket after paying all charges on his house. Further, he will have made an intelligent use of his leisure instead of consecrating it all to beer and betting.

(To be continued.)

#### A Refuse Destructor for Bridlington.—

The Urban Council has decided unanimously to carry out the recommendation to cause a Beaman and Deas refuse destructor to be erected.

## KENSINGTON TOWN HALL EXTENSION.

SOME nine or ten years ago the question of the provision of additional office and committee room accommodation in the Kensington Town Hall building first engaged the consideration of the Vestry, and they arrived at the conclusion that further accommodation was necessary for the conduct of the business of the Vestry. It was found that the required increased accommodation could not be provided by means of structural alterations to the existing Town Hall, and the attention of the Vestry was directed to see whether certain properties at the rear of the building could not be acquired with a view to the building being extended in that direction. The negotiations which were started with the owners for the purchase of the several interests in the properties proved unsuccessful, as a prohibitive price was asked. In August, 1892, the London County Council directed the Vestry's attention to what appeared to be inadequate accommodation for the holding of inquests in Kensington, the coroner's court being a room of small size in the basement of the Town Hall. It was pointed out that Section 92 of the Public Health Act, 1891, enabled the provision of a coroner's court to be made by agreement between the Council and Vestry, either in connection with the existing mortuary, or with any other building belonging to the sanitary authority. Upon this revival of the question, the Vestry again made an attempt to acquire the desired properties, but the attempt again proved unsuccessful. The site, however, was eventually secured at a total cost of £6,728. On the 4th inst. the new extension, which now occupies the site, was formally opened by the Lady Mary Glyn, who was accompanied by the Bishop of Peterborough.

The new building is connected with the Town Hall proper by a covered way which has had to be restricted in height in accordance with the terms of an agreement between the Vestry and the managers of the National Schools; and owing to the retired situation of the new building, with its frontages abutting almost wholly upon the churchyard, the exterior has been kept plain and is carried up entirely in stock brickwork, with Portland stone dressings. The ground floor is occupied by additional offices for the medical officer of health and sanitary inspectors. The members' room will be used by deputations in waiting. The remainder of the ground floor is occupied by the surveyor's department, comprising an office for the surveyor, a general office, and a drawing office.

There are two distinct entrances from Church Walk, leading to separate staircases to the first floor, the front portion of which is occupied by a large committee room, boldly treated in oak. In connection with the committee room are lavatories, a hat and cloak room, &c. The northern portion of the first floor is occupied by the coroner's court, witnesses' waiting room, and coroner's private room, which will also be used as a retiring room by the jury. The court room is fitted up in oak in a very complete manner, and is well lighted by side windows and a glazed dome. Over the front or south portion of the building a third story is built providing rooms for the accommodation of the hall-keeper. The whole building is to be lighted by means of electricity, and warmed by hot water coils in addition to the fireplaces provided. It has been erected in accordance with plans and designs prepared by Mr. W. Weaver, the surveyor to the Vestry, and Mr. W. G. Hunt, who were appointed by the Vestry to act as joint architects. Messrs. Leslie and Co., Limited, of Kensington Square, London, erected the building. The amount of their contract was £13,747, the whole cost of the building having been about £20,500.

**St. Paul's Church Institute, Miles Street, Liverpool,** is being erected at a cost of about £3,450.

# Bricks and Mortar.

EFFINGHAM HOUSE, ARUNDEL STREET,  
May 17th, 1899.

"I know what it is to live in a cottage with a deal floor and roof, and a hearth of mica slate; and I know it to be in many respects healthier and happier than living between a Turkey carpet and a gilded ceiling, beside a steel grate and a polished fender. I do not say that such things have not their place and propriety; but I say this, emphatically, that the tenth part of the expense which is sacrificed in domestic vanities, if not absolutely and meaninglessly lost in domestic discomforts and incumbrances, would, if collectively offered and wisely employed, build a marble church for every town in England; such a church as it should be a joy and a blessing ever to pass near in our daily ways and walks, as it would bring the light into the eyes to see from afar, lifting its fair height above the purple crowd of humble roofs."—JOHN RUSKIN.

## Architects' Decorations.

A NUMBER of leading architects have presented to the Dean and Chapter of St. Pauls a memorial which sets forth with admirable lucidity and force the case, from the architect's point of view, against Sir W. Richmond's decorations. They point out that the cathedral is in imminent danger of losing the grave dignity which has endeared it to the heart of the majority of Englishmen, and that this is due to the fact that Sir W. Richmond's scheme, whatever its abstract merits, has not been thought out in sympathy with and in subordination to the architecture of the cathedral. Three specific objections are stated, viz., that the designs are Byzantine in character, and alien to Wren's genius and to the intellectual atmosphere in which he lived and worked; that there is a great discrepancy between Wren's scale—which was followed by Stevens in the designs he made for the spandrels under the dome—and that adopted by Sir W. Richmond; and that the decorations now being carried out involve actual injury to the stonework of the cathedral as left by Wren.

## A Reply to Sir W. Richmond.

"IN the four great arches at the N.E., S.E., N.W., and S.W. angles under the dome," continues the memorial, "Wren, in order to satisfy the eye as to the constructive stability of his arches, left plain piers or abutments under the arches, and he deliberately abstained from any ornament to these piers in order to make clear the idea of strong support, which is their actual function. Sir W. Richmond has formed raised panels on these piers and studded the margins and divisions with *pateræ*—that is to say, Sir W. Richmond has stultified the architect's design, and in nearly every detail of his decoration he has, in our opinion, shown the same indifference to the clear intention of the architecture. Sir William Richmond has practically admitted his dislike of that architecture in his letter of May 6th, a letter more remarkable for its courage than for any appreciation of the gravity of the case. It seems to us that an artist so evidently out of touch with the conditions of his work should not be permitted to alter the character of the finest work of modern English architecture, and this feeling we believe to be that of the great majority of intelligent and educated Englishmen. We desire in no way to disparage Sir W. Richmond's attainments and well-earned reputation, but we cannot regard them in comparison with the fame of Sir Christopher Wren and the loyal preservation of his work." The signatures to the protest, including as they do, those of many of the most eminent of living architects, add weight to what is in itself a weighty and convincing document.

ONE interesting result of the St. Pauls' decoration controversy is that, little by little, stories of earlier schemes for decorating the cathedral have been brought to light. An

interesting letter, written by the late Samuel Palmer as long ago as 1879, was published in the "Times" the other day. The letter was suggested by proposals that were made about that time for the "completion" of St. Paul's. The writer remarks that the cupola is the part of the cathedral that especially attracts these "completers" as giving the wildest scope for their fancies and experiments. "Sir Christopher," he continues, "having kept the deeply-set windows of that sloping wall between the dome and the whispering gallery narrow, so nicely dispensing the 'dim religious light' as to leave the cupola in a sort of poetic mystery, mosaics were proposed not long ago to make the dome more cheerful, and metallic reflectors to brighten the mosaics! The slope of the pilasters is continued upwards at present by the architectural divisions in the chiaroscuro of Sir James Thornhill, so that the eye does not detect the artificial perspective; but directly the chiaroscuro is removed, and horizontal layers of any kind are substituted, the secret will out, the dome will seem to be 50ft. lower, and the wall which supports it about to topple upon the spectator." Thus the voices of the past enforce the protests of the present.

## Improving the London Bill.

THE London Government Bill, by the time it reaches its final stage, will be a very different measure from that which was introduced into the House of Commons a few weeks ago by Mr. Balfour. One by one the original proposals have been modified, altered, or altogether abandoned, in deference to the criticisms they have called forth from members on both sides of the House. We are particularly glad to note that the Government has decided to withdraw the Building Act clauses. The proposed transfer to the new borough councils of the right of administering the Building Acts would inevitably, if carried out, have inflicted serious hardship on architects, surveyors, and builders, and reduced to a state of chaos the regulations affecting building in London. We have no doubt that in eliminating this objectionable feature from his Bill, Mr. Balfour has been influenced by outside representations, including that from the Royal Institute of British Architects, as much as by Parliamentary criticism.

## Tudor House, Bromley.

MR. C. R. ASHBE, Chairman of the Committee for the Survey of the Memorials of Greater Britain, is appealing for the preservation of Tudor House, one of the last remaining Elizabethan houses of Bromley. The house contains much beautiful work of the early part of Elizabeth's reign. The building, with the extensive grounds adjoining, has come into the hands of the London County Council, and, while the Historic Buildings Committee have recorded it for preservation, the Parks and Open Spaces Committee have, says Mr. Ashbee, determined that it shall be destroyed. At a meeting of the London County Council last week the debate on the recommendation that it should be demolished in order to give a little more room in the grounds, was adjourned for a week.

## St. Dunstan's Church, Fleet Street.

IN our issue of May 3rd we made some comments on the proposal to build on the open spaces at each side of St. Dunstan's Church in Fleet Street. It seems that the Law Life Assurance Society, Limited, have offered £4,500 for the ground to the west of the tower, and at the other side it was intended to build a house for the rector. The latter part of the scheme, however, is opposed by the proprietors of the abutting building, who have claimed "ancient lights," and it has been temporarily abandoned. If the proposed buildings are erected, the church will have a sandwiched appearance, and the dwarf towers on either side of the central tower will be almost entirely hidden from view. If only the Assurance Society buildings are put up, the effect will be worse, as a ludicrous lopsided appearance will be given to the church. St. Dunstan's is not, we confess, a strikingly beautiful church, but it possesses

a very fine Gothic tower, the proportions of which are thrown into strong relief by being projected beyond the south wall to the building line of the street, with an open space at each side; and to fill up these spaces, or even one of them, would certainly spoil its beauty. The churchwardens defend their scheme with a very lame argument. They say that by building on each side of the tower they will screen from public view the plain brickwork of the church wall. If this is all the reason they have for destroying the beauty of so fine a tower, we sincerely hope that the application, when it comes before the Consistorial Court, will be successfully opposed.

## Architects' Registration.

At the annual meeting of the Devon and Exeter Architectural Society last week, a reference was made to the Architects' Registration Bill. It appears that while the R.I.B.A., the Leeds, Yorkshire and Birmingham Societies have signified their disapproval of the Bill in communications to the Devonshire Society, the Society of Architects, the Dundee Institute, the Northern Architectural and the Sheffield Societies are in favour of it. The Council of the Devon and Exeter Architectural Society express the opinion that in view of the manner in which much of the building work is designed in the district, some steps ought to be taken to safeguard the interests of not only the profession but the public at large. The New South Wales' Allied Society is about to endeavour to introduce into the Colonial Parliament a Bill which will have the registration of architects for its object.

## Preserving Haddon Hall.

SOMEWHAT extensive repairs have been found to be necessary at Haddon Hall in order to prevent that historic structure from falling into decay. The chief part of the work is the underpinning of the tower near the entrance to the hall. The tower, it seems, was found to be nearly 11in. out of the perpendicular. When excavations were made it was discovered that the whole tower rested on no solid foundation, but was built almost from the surface. It stands on a rock, but there were several feet of soil or shale between the base of the tower and the rock. The wonder is that it has stood for so many centuries before beginning to show signs of instability. The intervening space between the base of the tower and solid rock is now to be filled with blue bricks of the most enduring description, and thus all danger will be averted. The work has been entrusted to Messrs. Toft Brothers, of Youlgreave.

## A Happy Excavating Ground.

OUR archaeological readers will learn with interest that the celebrated *Puteal Libonis* has been discovered and explored by Signor Boni while carrying on his excavations in Rome. This puteal is found to be seventy-one centimetres in diameter. "St. C.B.," writing to "The Times" of the 8th inst. gives some very interesting particulars concerning this find. He says: "Its remaining walls are of tufa cut into mouldings of 'pedarole,' or square dentils. It has already yielded the fragments of three hundred vases of various dimensions belonging to the second century B.C., together with bones of ox, sheep, and boar, and a dozen skulls of weasel. Signor Boni has likewise been fortunate in his search for fragments of the arch erected by Augustus in Commemoration of the victory at Actium, which stood adjacent to the Puteal Libonis, and 'juxta ædem Divi Julii.' Its foundations were discovered in 1888 and its inscription in 1845. Signor Boni has now been able to identify seven magnificent blocks belonging to it, which can be quite easily replaced over the existing bases of the pillars thereof. It may be of interest in this connection to mention that the curve of the Arch of Q. Fabius (Allobrogicus), with its curious double key-stone, is complete but for one or two missing blocks. It is lying out on the ground opposite the 'Templum Romuli.' Its inscription was discovered at the same date as that belonging to the Arch of Augustus."

# R. I. B. A.

## ARCHITECTURE AND ENGINEERING.

By H. HEATHCOTE STATHAM.

AN ordinary meeting of the Royal Institute of British Architects took place last Monday evening, at 8 p.m., at No. 9, Conduit Street, Regent Street, W., with the president, Professor G. Aitchison, R.A., in the chair. The minutes having been confirmed, the president called upon Mr. H. Heathcote Statham, F.R.I.B.A., to read his paper on "The Architectural Element in Engineering Work." Mr. Statham said that he had intended to use in the title of his paper the more appropriate word "aesthetic," but had substituted for it the word "architectural," for he decided that, as there appeared to be an objection to the former, he would use the latter word. He did not wish his paper to be taken as derogatory to the position of Engineering. He considered that Engineering had, in the present age, taken a leading part. He thought that where small work had to be done, the architect was quite capable of doing it, such as in the building of small bridges, but where large works were carried out

### Special Knowledge

and skill were undoubtedly demanded, and such works should be done by an engineer. The immense constructional works, such as viaducts and bridges, were to the nineteenth century what the cathedral or church was to mediæval times. An engineer had one great advantage over the architect, he knew exactly what he wanted to arrive at. He considered that what the public wanted that they would have; they had wanted great engineering works, and great engineers had come forward. If the public wanted great Architecture, then there would be great architects. There was some truth in the statement that Engineering and Architecture should not be separated. Architecture did not exactly aim at economy of material, but in Engineering any material that was not actually in use was wasted. It was contended that the old architect and engineer were practically one, but this was hardly so. It was found that great artists had in the past designed instruments of war, &c., but the Roman architect, such as he who built the Colosseum, could not do without his Corinthian order, whereas the Roman engineer built his aqueducts in the plainest manner. Engineering works were those in which only

### Material and Utility

were considered. He thought that, if considered in this way, a large proportion of engineering works were very interesting. Ruskin had called the railways the spoilers of landscapes and beauty, but he thought that railways had in very few cases caused loss of picturesqueness and beauty beyond the time they were in course of construction. And so with all engineering works: if they were built truthfully, they would naturally have beauty in our eyes. A bridge could not be built across a river, for instance, without the beautiful sweep of the arch being pleasing. In a railway bridge the steel girders were redeemed from ugliness by the consideration that an arch would not give this same appearance of stability. A serious drawback to iron construction was the necessity of painting it. The reason why we did not care for iron construction was, he thought, that we were at present unused to it, and only familiar with stone and timber. When one got used to steel, it would be liked, as stone and timber were. A girder was simply a specially constructed beam or lintol, and there was no reason for it being disliked because of its being constructed of steel instead of wood or of stone. If engineering work was treated simply it would create its own æstheticism. If the piers of a bridge could be made in stone or brick half the objection to steel construction would be done away with. A number of illustrations were then shown by

means of the lantern and most ably explained by Mr. Statham; these illustrations consisted mostly of bridges, owing to the difficulty of getting illustrations of other engineering works. Having shown these limelight views, Mr. Statham dealt with the design for

### The New Vauxhall Bridge

across the Thames, which, he explained, was a special object of his paper. He pointed out how here, as was the general tendency with modern engineers, ornamentation and architectural treatment had been attempted, when simplicity should have been aimed at. He thought it was not to be expected that engineers could handle architectural detail, which was only to be done by a special training. The great thing they went wrong over was the use of mouldings, and the non-perception of scale. In the Tower Bridge a great mistake was made by using stone to mask the construction, and this showed how necessary it was to be truthful. The columns of the Vauxhall Bridge would have looked better in the centre of the arch, and the moulding at the foot of the piers was out of scale, being wholly too large. Mr. Mountford had suggested to the author of the paper that the voussoirs, which, by their present design, gave an appearance of weakness at the top of the arches, would perhaps look better if their lines had been run up to the top of the parapet. Mr. Statham had prepared a design on this suggestion, and submitted it to the meeting. He hardly thought that the Bridges Committee of the London County Council and their engineer had acted fairly to the Institute. He wished to ask why should not bridges be built by the architect assisted by the engineer, as well as by the engineer assisted by an architect?

### THE DISCUSSION.

The President then called upon Lord Wemyss, who said that he was in thorough sympathy with the movement that engineering, which invariably turned out such horrors as these bridges, should be under some control. He thought that engineering skill should not have been employed in spoiling landscape, but in obviating this spoilation. He was sure some kind of control was wanted, as could be seen in St. Paul's. What he was trying to get adopted by the Government, was the erection of models of important buildings with their surroundings. Drawings told one nothing. Modelling was, in his opinion, everything. He requested the Institute to help him to urge that everything should be first done in model. He regretted to see that the Institute had not been forward in protesting against the decoration of St. Paul's.

Mr. A. T. Walmisley, M.I.C.E., said he was in perfect sympathy with Mr. Statham's remarks. There was no more need for architects to do their own engineering than there was for them to do their own quantity surveying. While engineers should be responsible for the stability of the structure, architects should be called in to do the designing of it. Referring to Mr. Statham's remarks upon the painting of engineering works, he thought the Forth Bridge was defective in having no provision for painting the inside of it in order to protect the ironwork. He considered the Victoria Railway Suspension Bridge, was a fine one. He urged the importance of being truthful in construction.

Mr. A. Beresford Pite, in proposing a vote of thanks, said Mr. Statham had clearly and convincingly demonstrated the need of simplicity in engineering works. With respect to Lord Wemyss's statement about St. Paul's, the Institute had taken some action in the matter, and he thought they had had a great deal to do with the good that had already been done in obtaining the stoppage and ultimate removal of the objectionable stencilling and black lettering there.

Professor Robert Kerr seconded the vote of thanks to Mr. Statham. He found fault with the photographic illustrations shown on the screen, from their not being chosen from the best point of view for architectural consideration, but rather from the point of view of the artist. He saw no reason why construction should not be rendered as beautiful by the engineer as by the architect. In this country

there was absolutely no example of engineering work up to the mark in respect to artistic character. There was no reason why this should not be done, and architects did not object to the engineer doing this. He thought that, as Lord Wemyss had told them was the case, the public could not distinguish from drawings, and that they should therefore be shown models.

Mr. William Woodward disagreed with Mr. Statham on several points. The speaker contended that nothing could excuse the ugliness of the Forth Bridge. In regard to the new Vauxhall Bridge, a great cry was raised against the columns carrying nothing; but let them look amongst their own work. In buildings by high Art architects, columns often carried nothing, and these present columns did carry lamp standards. There was no sense in the objection to the facing of the concrete by granite, for in the finest Italian churches, which were generally admired, there was a facing of marble. He was impressed with the dignity of Sir A. Binnie's design for the bridge, and he contended that if the design was carried out in its present form it would be a credit to London. The design—the joint effort of Mr. Statham and Mr. Mountford—having voussoirs carried up to the top of the parapet was most ugly.

Mr. E. W. Hudson asked for Mr. Statham's opinion on the Westminster Bridge which crossed the Thames at the Houses of Parliament, which he considered rather good. With regard to the castellated treatment of a bridge at Conway Castle, shown on the screen, he hardly thought this mediæval treatment was out of place for some engineering work.

Mr. E. W. Mountford thought that Sir A. Binnie had been very successful with his bridge, and that the great piers helped the great spans. The smallness of the piers was objected to, and the Institute had at first wished to increase them, but they were at once told that this was impossible, as they were already the maximum that the Thames Conservancy would allow. He still thought that their efforts would not altogether be lost, and the London County Council would probably leave out some of the superfluous ornament. The letter to Sir A. Binnie which had been sent by him and Mr. Waterhouse was a strictly private one, and should not have been brought forward, and had been written for a reason which could not then be explained. They had, however, simply expressed their approval of the general design of the bridge, fault being found with the moulding and details.

Mr. W. D. Caroe thought that engineers did not understand what was ornament. It had been suggested that the columns on the bridge looked like drain ventilators. The County Council had recently put up similar columns as drain ventilators on the Chelsea Embankment, and had consequently disfigured it. Mr. Statham had clearly shown how necessary it was to treat engineering works simply.

Mr. Statham, replying to the vote of thanks, said that in the Forth Bridge doors, rails, &c., were provided to permit of the painting of the inside of the tubes, &c. He considered Prof. Kerr had rightly found fault with the illustrations to his paper, but they were the best that he could obtain. He saw no reason why an engineering work should not be beautiful; the reason for the present dislike was unfamiliarity with steel and iron. He had liked the Westminster Bridge until he found that its real construction was concealed.

Prof. Aitchison then announced that at the special general meeting on May 9, he would move the nomination of Mr. G. F. Bodley, A.R.A., as a Fellow, and that gentleman would be put up for election at the meeting on June 12, when Mr. T. J. Bailey, F.R.I.B.A., would read a paper on "The Planning and Construction of Board Schools."

**Kew Bridge.**—The Joint Committee of the Middlesex and Surrey County Councils has agreed to a modification of the original plans of the temporary structure to be erected during the construction of the new Kew Bridge, involving an additional cost of £500.

# THE ARCHITECTURAL ASSOCIATION.

## SPECIFICATIONS.

(Continued from page 206, No. cccxii.)

**IN** Smith and Founder take this order: lintols, chimney bars, straps, girders, floors, columns, roofs, carriages, iron windows, gutters, stack pipes, external railings and gratings, stoves and ranges and heating. Heating may come under heating engineer.

Under Slater and Tiler, roofs first, then vertical slating or tiling, shelves, cisterns, and such like smaller items.

In Plumber take gutters, flashings, and other roof finishings, flats and their gutters and finishings, then drinking water supply pipes, cisterns, sinks, lavatories, baths, and fittings. Then water-closet supply pipes, cisterns, water-closets, slop sinks, urinals and fittings, soil and ventilating pipes, hot water circulation.

**Zincworker and Coppersmith.**—Take flats, gutters, and finishings, pipes, lightning conductors.

In Plasterer describe first the general plaster work to ceilings, partitions, and walls, then follow with cornices, coves, centre flowers. Then those parts in cement, and, finally, the external plaster or cement work, or if preferred take the external work first.

**Glazier.**—External glass to skylight windows, doors, then internal lights and screens, and pavement lights last.

**Painter and Paperhanger.**—Internal work to ceilings, walls, wood and ironwork, and polishing. Then external painting to wood, iron, and cement work.

As to the order in the trades I have not mentioned, such as bellhanger, gasfitter, and electric lighting engineer, which are not generally of any considerable variation, there is very little to suggest, but keep the order of the work, such as the main items, first and fittings afterwards.

I might mention that the order adopted in bills of quantities is not precisely the same in all parts as that of a specification. The order in quantities is placed to an extent to facilitate the pricing, and the order in the specification should be to distinguish quickly the position of the work.

## General Directions.

One word before I come to the last part of this paper. If the prices in a bill of quantities are not to be taken into account in the settlement of extras and omissions, or if quantities have not been supplied, then a schedule of items should be provided for the builder to fill in and be attached to the specification and form part of the contract upon which variations may be valued.

I have now, I think, stated the various points which are necessary to be observed for efficient specification writing, and I will just mention a few matters which are worthy of attention and which are not always found to be clearly stated in a specification, but are sometimes omitted altogether, taking preliminary items first.

Always state that the plant and temporary erections are to be removed when directed, such as the scaffolding, hoarding, shoring, clerk of works's office, and any other items temporary in their character. The provision of these items is usually stated in the specification, but their removal is not always mentioned.

State if the hoarding is not to be let to an advertisement contractor.

Clearly define what you mean by prime cost and provisional amounts.

State if the employer's business is to be carried on during building operations.

Mention that the contractor is to give due facilities to other tradesmen who may be employed on the premises, and also that the contractor is to allow such other tradesmen the use of his scaffolding and plant.

State to whom any coins or curiosities

found on the premises or during the excavations are to belong.

If the contractor has done any work previous to signing the contract, then embody this work in the contract, otherwise an extra may be claimed for some small items, which at the time of signing the contract were understood to be included in the contract amount.

**Excavator.**—Where the foundations in a length of walling are not all one level, require the excavation to be in steps and not on the rake. Stipulate that there should be no excavations for ballast or sand unless necessary for the actual excavations, as this may affect the stability of the building.

Specify that brick rubbish be put under surface concrete which receives wood-block flooring or paving. There will then be less liability of damp coming through. In clay soils require the foundations to be taken down below the action of the weather. This may necessitate the foundations being taken down some 4ft., 5ft., or 6ft. below an otherwise good bottom. Specify a proportion of coke-breeze, slag, or gypsum, in concrete fireproof construction. It will the better resist the action of fire.

State that all foul earth and cesspools are to be removed and the excavation filled up with clean rubbish or concrete. Encase new drain pipes in concrete. If a slight settlement occurs, they will then the better hang together. Half channels in manholes are better formed in cement than with half pipes. A cleaner flow of sewage can thereby be obtained.

Then, as to the items under bricklayer. Do not forget to mention these points: To tie the walls in; to build external walls hollow, if possible, but in damp situations certainly; and specify the lead covering over the heads of doors, windows or arches coming within the hollow space. This will prevent the wet being communicated to the inner thickness of the hollow walls. Describe a weather joint externally to brick walls. Build the brickwork up in even heights and fill up all the joints. Let the sand be free from dirt and the water clean. Sea water or sea sand may be used where dryness is not essential. Build chimney stacks, where they appear above the roof, either partly down from the top, or else wholly in cement, preferably the latter. Build all parapet walls and the brickwork immediately under the eaves a certain distance down in cement, and a second damp course here and to chimney stacks will not be amiss. Half-brick walls should, of course, be built in cement. Boundary fence walling should have a damp course, and preferably be built in cement.

In retaining walls against the earth do not omit the weeping drains, or other device for taking off the accumulating water at the back.

Smoke flues should not be too large—9in. by 9in. is sufficient for most fireplaces; and gather the brickwork quickly over the fireplace openings. Build all stoves around solid, and fill up the boxings to chimney-pieces. Fires have often occurred through neglect of this precaution. Do not put too long a description to terra-cotta work because it may be the custom. Put a straight joint between connecting walls and a heavy tower, and do not attach a large chimney shaft to the main structure.

**Mason.**—Stone templates should be of considerable area, and tooled,—not left rough. In fact, any stone upon which work is built should be tooled. Do not forget the cement packing between the rivet heads on the top of flange girders and the cover stones. Stone hanging steps are almost better placed in position and pinned in after the building is up, sand courses being left in the brickwork for this purpose. In stone columns or pilasters the apophyses should be worked on the shafts. The effect is better. Portland cement will stain delicate marbles and some limestones.

**Carpenter and Joiner.**—When possible, employ wood block flooring on the lowermost floors next the ground. The ordinary joists and flooring for this position are more liable to decay. In this latter case let the joists and plates be of oak. Put cast-iron shoes or stone bases to all solid door frames. Bed window sills on to the stone sills in white lead, and do not omit the iron tongue. The

cleats to roof trusses and horns on solid door frames are sometimes forgotten. Snow boards to roof gutters will often prevent wet penetrating when the snow melts. Open casement windows outwards if you want to be perfectly sure of keeping out the wet. The ends of timbers, where bedded in walls, should have a circulation of air around them. A little sap on the edges of timber exposed to the air will not be any very great source of weakness, and it will not be likely to affect the rest of the timber. All gutters should be wide enough to walk along. Small angle fillets at the junction of horizontal and vertical planes of a roof flat will make better work than if the leadwork be turned up sharply. This remark will also apply to lead gutters. In some cases it is almost preferable to put a p.c. amount for the ironmongery to each door, window, or other fitment, and select the class of ironmongery afterwards.

**Slater and Tiler.**—Tiles and slates without boarding under should be torched.

**Smith and Founder.**—Let rain-water pipes stand out about 1in. clear of the walls.

**Plasterer.**—Timbers over 3in. wide should have the arrises taken off before the lathing is nailed on; this will enable the plastering to get a better key. The walls at the backs of skirtings or any other woodwork should be plastered over to prevent vermin harbouring. The outside of all flues, between timbers, floors, and where in the roof, should be roughly rendered over. This will be a preventive against fire. Single laths should not be lapped at the joints, as is often done.

**Plumber and Gasfitter.**—Do not omit the exhaust pipe to hot water circulation, or to the heating arrangements. Keep all hot and cold water pipes well away from each other, and from the action of frost. All pipes, whether gas or water, should be readily accessible, and if possible on the face of the walls. The furring up of hot water pipes is chiefly found between the boiler and the circulating cylinder, or tank. This portion of the piping should be easily accessible for cleansing. All horizontal gaspipe should be laid with a fall, to prevent any condensed liquid remaining in any part of the pipes, and thereby affecting the efficiency of the gas supply. It is a good plan to fix all internal pipes about 3in. clear of walls, especially hot water pipes. Do not work the hot water supply and heating arrangements from the same boiler. Failure is almost certain.

**Glazier.**—All glass subject to jars should be bedded in wash-leather or india-rubber as well as in putty. I might mention that one of the best methods for glazing skylights is merely to seal the glass on a bedding of putty and then to sprig it in and paint the joint over with the woodwork of the bars. It is perfectly water-tight, and there is no putty on the weather side to get out of order. This plan is much adopted in horticultural buildings, both vertically as well as in the top light glazing. The laps of the glass to top light should be cut to a curve. The water being directed down the centre of the glass and away from the rebates in the bars.

**Painter.**—External painting, if done in the spring or autumn will give a more satisfactory result. No painting, papering, or other decoration should be done while there is a suspicion of dampness about the building. All ironwork should be well painted over before it is buried or covered up.

## THE DISCUSSION.

Mr. G. H. Fellowes Prynne, in opening the discussion, referred to Mr. Macey's statement that there were only two ways of obtaining information for a specification, viz., study and observation. If they were going to write a specification, they ought to know something about the matter, and not have to ask their friends' advice, as Mr. Macey had suggested in his paper. He thought it was a queer way of putting the subject before the members of the Association. It seemed obvious to him that they would take great care that their copies of a specification agreed with the original, and he did not think any business man would fail to do so. The plans of the architect were his specification, and the specification was written for

the purpose of explaining the plans for the benefit of the surveyor or foreman, so that he might fully understand the drawings and details given therein. With regard to the question as to whether the surveyor or architect should write the specification, there was no doubt in his mind that it was the duty of the architect. The architect should have clearly in his mind the plans of any buildings he had designed, and his notes, although not written *in extenso*, should be absolutely sufficient for any surveyor to take the quantities from. When the architect is in sympathy with his work, he will make his expressions perfectly clear to the surveyor, who must thoroughly understand the architect's work if the quantities are taken out by him. If he understands the architect it is almost impossible for him to make a mistake when he amplifies the specification given to him by the architect. Mr. Fellowes Prynn thought the most valuable suggestion made in the paper was that the architect should, when quantities were not given, draw up his specification fully, and use a scheduled price-list. He concluded by moving a hearty vote of thanks to Mr. Macey. This was carried with acclamation.

Mr. H. Lovegrove expressed general agreement with the paper. He agreed with the president that the architect should write the specification. Mr. Macey had laid stress on an important point, and that was the figuring of plans. Walls, for instance, should always be figured. But it was an unfortunate fact that five out of six plans were badly figured. Mr. Lovegrove thought it was a capital plan to number the rooms consecutively in a large building, as it was such an easy matter to say that rooms Nos. 5, 6, and so on, shall be done in such and such a way. He endorsed the lecturer's remark about not making working drawings pictures. Just a few lines, not sufficient to obscure the details, made a plan effective and worth looking at. He was partly in agreement with the author on the separation of trades, although this, he said, could be carried too far. Legal formalities should only be mentioned in the contract.

Mr. F. T. W. Goldsmith said that Mr. Macey's paper had dealt with a very big subject, and had dealt with it from his particular point of view. A specification, he said, was not like a bill of quantities, a resumé, but a description of the method on which the architect's drawings were to be carried out. If any detail was required which was not made clear by the plans, then he thought the specification could be called into requisition, and when used in that way a particular description of the methods on which the architect would like the work carried out should be noted in the specification. The suggestion concerning the grouping of similar items should be adopted, as it was much better to describe a number of similar rooms or windows than to refer to windows or rooms separately. There was a disposition to regard a specification as a stepping stone to the bill of quantities. He was of the opinion that the specification and the contract should be kept distinct; and that the schedule should be included in every specification, as it was a splendid check on any builder who was inclined to overcharge.

Following Mr. Goldsmith came Mr. B. F. Fletcher, who said that he thought the subject an amusing one. All the speakers agreed that architects should write their own specifications, and then admitted that they did not do so themselves. When drawings and quantities were sufficiently full, the specification was superfluous. No man was so well able to write a specification as the man who had taken out the quantities for the building. The system of tabulation met with his approval. He did not think that because a good many architects did not write their specifications that they could not; it was because they did not think it worth the trouble and time.

Mr. C. H. Brodie started by defending Mr. Macey's statements. He said that it was all very well to pooh-pooh the remark that they should see that the specification agreed with the drawings, but it was a necessary remark to make in a paper such as had been read, because the two things did not very often

agree. With Mr. Macey's statement that a specification was a legal document, he did not agree. It should not be legally phrased, and it was a great mistake, in his opinion, that people would insist upon using legal phraseology in specifications.

Mr. Max Clark entirely disagreed with all the definitions of the word "best"; so far as specifications were concerned they were all unnecessary. The best timber would be too expensive, he said, for any building, and the same remark applied to the best iron, steel, and Yorkshire stone. He did not agree that the planking of the foundations should be put at the end of the excavation section; it should go at the beginning, as it applied to every part of the excavations.

The President said that he would rather that an architect drew every detail, and wrote every line of the specification. He did not recommend that an architect should leave the specification in the surveyor's hands. His own practice was to give an unpriced copy of the bill of quantities to the clerk of works, and he found this arrangement worked well.

## Enquiries Answered.

*The services of a large staff of experts, including all those engaged on "Specification," are at the disposal of readers who require information on architectural, constructional, or legal matters. Questions should in all cases be addressed to the Editor.*

### BOOK ON LIBRARY CONSTRUCTION.

*To the Editor of THE BUILDERS' JOURNAL.*  
SHEWSEBURY.

DEAR SIR,—I shall be obliged if you will kindly advise me of a good modern book on Free Libraries. I want the best detailed book on the subject, giving useful particulars, such as floor space required, sizes of book cases, storage, hints as to arrangement, &c.

PROVINCIAL.

"Library Construction," by F. J. Burgoyne, published by George Allen, is a good book on the subject, and contains such particulars as you require.

### THE STUDY OF ORNAMENT.

*To the Editor of THE BUILDERS' JOURNAL.*  
STOURBRIDGE.

SIR,—Can you or any of your readers tell me of a text book; or how I should proceed with the study of "Historic Ornament"? I tried testing my knowledge of the subject by taking the examination held by the South Kensington Science and Art Department on the 17th ult. I thought that I had been studying the subject by attending the lectures bearing upon it by a well known lecturer, and by making such measured drawings and sketches of historical buildings and furniture, &c., as were accessible to me.—Yours faithfully,

PROVINCIAL STUDENT.

As regards the general question everything depends upon whether your aim is to pass examinations or to acquire really valuable knowledge. Your plan of making measured drawings and sketches from existing examples is excellent, and in time you will gain the knowledge which you want, but the process, though sure, is slow. The most recent general text-books on the subject at a moderate price are Ward's *Historic Ornament*, two vols., Chapman and Hall, and Meyer's *Handbook of Ornament*, Batsford (which gives an enormous number of examples, but only a small quantity of explanatory text). Messrs. Batsford have also in the press a book called "Notes on Ornament," by Mr. Glaisher, of the Manchester School of Art. A study of any of these might be supplemented by that of books of examples dealing with various periods, when you have made up your mind what periods and styles are most worth your while to pursue in detail. The examination paper which you send appears rather discursive, but you must remember that the examiners endeavour to cover as large a field as possible, desiring to give an equal chance to many different tastes. S. S. G.

## Professional Practice.

**Birmingham.**—A branch school of art is being erected in Moseley Road, and the foundation-stone was laid last week. The land selected for the school is situated at the corner of Lime Grove and Moseley Road, with a frontage of about 65ft. to the latter. A strip, a yard wide, has been given up to the widening of Lime Grove, and the new building, which occupies the front half of the remainder, has been planned with a view to future extension, so as eventually to occupy the whole of the land. The building when complete will present a symmetrical façade of classic character to Moseley Road, with the front entrance block advanced 7ft. in front of the side wings, and crowned with a circular pediment. A large entrance hall leads, through an open colonnade, to a stone staircase in the rear, which readily admits to all parts of the building. Leading directly from the hall there are also rooms for the masters, curator, and library. Beneath the front portion of the building will be a large basement, to be devoted to modelling and metal work; and on the first floor, over the entrance hall, a lecture room will be provided, with an annexe for building construction. The rear portion of the building will consist of three large classrooms. All these classrooms are well lighted, and approached by a corridor running along the central axis of the building, which will constitute the main artery of communication when the building is extended. The work is being carried out from designs by Mr. W. H. Bidlake, architect, by Messrs. Smith and Pitts, builders, who are under contract to complete the school by July 31st next for the sum of £6,602, minus an allowance of £100 for the old buildings.

**Chingford.**—Queen Elizabeth's Hunting Lodge, in Epping Forest, is to be restored at a cost of £500. The lodge is an oblong structure of timber, 30ft. by 20ft., consisting of three stories, with gabled ends and high-pitched roof, the staircase projecting from the hall. The massive timbers are still in particularly good condition, the walls being upright and the floors level. The restorations are to be carried out in accordance with recommendations submitted to the Corporation of London by Mr. J. O. Scott. In his report Mr. Scott points out that when the building was "restored" fourteen years ago the object seemed to have been to make the building appear new, and he recommends the removal of the partition on the first floor, taking away the plaster, restoring the woodwork, providing a new oak floor and ceiling, adding four new windows, and restoring the exterior.

**Halifax.**—The memorial stone of a new public hall for Halifax was laid recently. Mr. W. C. Williams is the architect. The building will comprise a large hall with a seating capacity for 2662 persons as follows:—Auditorium 932, grand circle 500, balcony 730, orchestra 500; a ballroom constructed on the latest principles; a lecture-theatre with a seating capacity of 370; and a reading-room or lounge with entrance from Fountain Street. There will also be eight shops; and a restaurant or dining-room, capable of accommodating 200 people, is provided in the basement. The total amount of the tenders is £20,482, and the cost of site £8,537.

**Wandsworth.**—The special committee with reference to the provision of new Board room and office accommodation for the Clapham and Wandsworth Union, have reported that, in pursuance of the power vested in them, they had appointed Mr. Alexander Graham, of Carlton Chambers, 4, Regent Street, London, W., to be the assessor to advise the guardians as to the merits of the respective designs received in connection with the new Board room and offices, at a fee of fifty guineas. Mr. Frederick W. Hingston, of Westover Road, Wandsworth Common, and Portland House, Basinghall Street, E.C., has been appointed quantity surveyor.

## Keystones.

**An Extension of Victoria Pier, Pembroke,** was opened by the Duchess of York last week.

**A new Library at Putney** has been opened. It occupies an area of 11,000 square feet, and contains about 9,000 books.

**New Public Baths at Radcliffe** have been erected, and were opened recently. They are in Whittaker Street, and have cost £5,000.

**A Statue** has been erected to the memory of Admiral Phillip, the first Governor of Australia, at Sydney, at a cost of £12,500.

**A Memorial to the Gordon Highlanders** who fell in the recent campaigns is to be erected in Aberdeen in the shape of a granite cross.

**A Public Library for Colwall.**—A new public library was opened by the Bishop of Hereford, on the 9th inst., at the village of Colwall, near Malvern.

**Merry Street School, Motherwell,** is being greatly enlarged according to plans by Mr. A. Cullen, F.R.I.B.A. Messrs. Maccall and Harvie are the measurers.

**A new Hospital** is being built in Oxford Street and Gloucester Street, Manchester, in accordance with the designs of Messrs. A. Waterhouse and Son, of London.

**A Monument to Duke Ernest of Coburg** was unveiled at Coburg last Wednesday. The monument, which is in the form of an equestrian statue in bronze, is the work of Professor Eberlien, of Berlin.

**Guildhall Art Gallery.**—It has been decided by the Court of Common Council to make an annual allowance of £500 for the purchase of paintings or drawings to be exhibited in the Corporation Art Gallery at Guildhall.

**The Gladstone Memorial.**—At a meeting of the Executive Committee of the Gladstone Liberal Memorial Fund, it was announced that Mr. F. W. Pomeroy has completed the statue of Mr. Gladstone in clay, and will shortly commence on the marble.

**Byron Statue for Aberdeen.**—The Aberdeen Byron Statue Sub-Committee have decided to erect a bronze figure of the poet in front of the grammar school of which Byron was a pupil, and they have chosen Mr. Pittendreich Macgillivray as sculptor.

**New Public Buildings at Bristol.**—The Bristol City Council have applied to the Local Government Board for permission to borrow £7,125 for the provision of a Council Chamber and Public Offices, and £3,250 for the erection of fire stations. It is proposed that the Council Chamber be 60ft. by 34ft. wide.

**A handsome cross** in Aberdeen granite has been erected over the grave of Sir Frank Lockwood, in the cemetery at Putney Vale, adjoining Wimbledon Common. The design is an adaptation of the Ancient Cross at Oronsay, and stands about 12ft. high. The work has been carried out by the Art Memorial Company, of West Norwood.

**Excavating Accident at Yarmouth.**—During excavating work for the Yarmouth Water Company's new reservoir at Caister there was an alarming subsidence of earth. Tons of soil suddenly fell into the pit where three men were working. Two of the men extricated themselves, but the other had to be dug out, and it was found that both his legs were fractured.

**A Beautiful Memorial Window** has been erected in the south aisle of the Choir of Lichfield Cathedral to the late Ven. Melville Horne Scott. A sum of £561 was raised, and after paying the cost of the window, the balance is to be invested. The particular subject of the window has been selected according to the plan of the windows in the south aisle—all being taken from the early chapters of the Acts of the Apostles—and the scene represents St. Barnabas and others bringing the proceeds from the sale of their lands and laying the money at the Apostles' feet.

**A New Town Hall.**—A resolution was carried at a meeting of ratepayers at Maindee in favour of building a new Town Hall at Newport, Mon., on another site, instead of extending the present structure, as had been proposed.

**Leeds Public Baths.**—The fifth public bathing establishment, erected by the Leeds Corporation, was opened recently. It is situated in the Meanwood Road, and has cost £13,000. The architects were Messrs. W. Hanstock and Son, of Leeds and Batley.

**The Proposed Enlargement of Bradford Town Hall,** in view of the extension of the city boundaries, was discussed at a recent meeting of the Bradford Corporation Finance Sub-Committee. The subject is to be considered again at a future meeting.

**New Church at West Bromwich.**—The foundation stones of a new Primitive Methodist Church in the Lyng district of West Bromwich were laid a short time ago. The church is to be erected from plans by Mr. Alfred Long, and will cost £4,990.

**The Improvement of St. Ninian's Cathedral, Perth,** is being proceeded with. Of the £10,000 aimed at last year, £8,629 10s. 8d. has been paid or promised, but the improvements, which were then estimated to cost £10,000, have since been found to amount to £14,950.

**A new Coroner's Court for Poplar.**—It has been decided by the Poplar District Board by a majority of one to erect the new coroner's court by direct labour. The cost is estimated to exceed £8,900, and this will be the largest work carried out by this system in the East of London.

**Historical Bath.**—The Bath Corporation is pursuing a scheme of affixing mural tablets on some of the many houses in the city possessing historic interest. They have just caused one to be placed on the façade of 19, Bennett Street, where Admiral Phillip, the first Governor of Australia, lived.

**Another Statue of Cromwell.**—At a meeting of the St. Ives (Hunts.) Town Council last Thursday, it was decided to try to obtain funds for the erection of a statue in St. Ives to the Protector. Huntingdon is also endeavouring to raise a fund for a statue of Cromwell, and it is thought that this has stirred up the people of St. Ives.

**A Bust of Mr. Gladstone,** which is said to be exceedingly lifelike, has just been executed for the Liverpool Reform Club by Mr. H. C. Fehr. The bust has been made to the order of the Art Memorial Company, of West Norwood. Mr. Gladstone is represented in his L.L.D. robes at the period when he was passing the Home Rule Bill.

**Medieval Paris at the Exhibition.**—Not far from the Machinery Hall at the Paris Exhibition, an imitation of the Cour des Miracles, or reproduction of the notorious beggars' haunt of the Middle Ages, has been organised. The show is called "Paris in 1400," and has been planned by M. Colibert. The district between Notre Dame des Victoires, near the Bourse and the Porte Saint-Denis, has been reproduced in panoramic fashion, with appropriate imitations in miniature of various monuments and buildings. The Mayfair of the Middle Ages is also shown, and the exhibition on the whole promises to prove an attraction as a curious reconstruction of a picturesque portion of old Paris.

**A.A. Officers for 1899-1900.**—The following is the result of the election of officers for the Architectural Association for the coming year:—President: G. H. Fellowes Pryne. Vice-Presidents: E. Howley Sim, H. T. Hare. Committee: B. Pite, W. A. Pite, P. J. Marvin, A. H. Hart, F. G. F. Hooper, H. A. Satchell, M. Garbutt, W. A. Forsyth, W. H. Seth-Smith, A. Bolton. Hon. Treasurer: Hampden W. Pratt. Hon. Librarian: A. S. Flower. Hon. Secretaries: G. B. Carvill, R. S. Balfour. The foregoing form the Committee. Hon. Solicitor: W. H. Jamieson. Hon. Assistant Librarian: W. B. Dukes. Hon. Auditors: J. W. Stonhold, W. E. Davis. Assistant Sec. and Registrar: D. G. Driver.

## Views and Reviews.

### THE EXHIBITION AT KNIGHTS-BRIDGE.

In the galleries of the International Society of Sculptors, Painters, and Gravers there are things, pictures especially, to be seen with a degree of comfort which may possibly be experienced elsewhere, but never at Burlington House. There is no overcrowding either of persons or paintings, and, with regard to the latter, there is the inestimable advantage of having them all on the line, excepting only the few that may as well be a little higher. If only the light were better the condition of things would be perfect, but unfortunately during a great part of press day it was quite insufficient. In the main galleries it is all right when the sun shines, but there is never anything like enough on the walls of the room where the drawings and prints are, and as these form an important part of the whole exhibition the disappointment appeared to be general. The critic is more likely to be serene and impartial under conditions which favour the exercise of his very peculiar faculty than he can hope or pretend to be when there are thousands of things to be seen, but ever here he may wonder, considering what he has heard of the vigorously exclusive policy of the Society, that so much inferior work is admitted.

It must be because the Society, being nothing if not eclectic, is prepared to bestow its blessing upon whatsoever savours of art that such an absurdity as "Fate," No. 146, is admitted. The artist has better to show, and such a taste of his quality as we have in the other room should have been considered enough. An artist and naught else is the painter of "Persephone," No. 202, who fails, it is thought, completely. The public is much to be pitied, because designers, for the most part devoid of any imaginative faculty, are so often required to give form to our conceptions of life in worlds not our own, and this is a case in point. One can imagine them saying: "Space here for the decorative artist," and space is given accordingly.

There is evident everywhere here an impartial delight in mere art; the consequence is that all kinds are represented, and of each we are shown the best, the best that was to be had: By Mr. Whistler, the very quintessence of etching; by Mr. Whistler elsewhere some selected bits of portraiture that seem to forbid our attempting more in that direction. We say "in that direction" advisedly, for it is not for everyone to discover either in face or form what Mr. Whistler does; nor, on the other hand, is it pretended that his selections exhaust the whole subject, and what Mr. Henry sees may be thought in its way to be quite as important; for characterisation assisted by absolute artistry can never go further nor be more completely satisfactory than in his portraits here.

If it be true that the French imagine nothing but what is impure, and that the Scotch are excessively sparing of what little imagination they have, it would seem to follow as a matter of course that the best of the portraits and landscapes should be the most remarkable things in the show, and certain it is that they are. Taking a number of Laverys and Guthries for granted, the best remembered, perhaps, are Alexander Mann's, No. 104; T. T. Allsop's, No. 113; Harold Speed's, No. 230; J. Sauter's, No. 51; and Mrs. Walton's, No. 155. It happens only too often that the painter is more in love with his brush than his sitter, but this from the earliest times has been so, and by way of compensation for what does not appear, we ask that the painting itself, as if by Velasquez or Rembrandt, shall be amazingly good. Speaking generally, then, of landscapes and portraits together, there are numberless ways in which Nature affects the painter, and as many of telling her story. Whoever has perfected any one of such ways is a master in his own sphere, and able to impart to whatever he does the ineffable distinction of style. What delights one here is the fact that of each of these styles there is one perfect

example at least. Compare for its breadth and almost epic simplicity No. 227, Calma Crepuscolare, by the Italian Fragiocomo, with the more familiar Anglo-Gallican renderings of Nature, seen dimly because of the heat and the vapours, and it will be agreed that room has been made for nearly everything good of its kind.

In the rooms devoted to drawings and engravings we arrive at the same conclusion; in every art the top note struck by some recognisable master, and nothing could be more instructive than works disposed in this way, for they illustrate almost to perfection, the principles we would if we could inculcate. It is proposed to make the sculpture and other examples of craft together with those in the New Gallery the subject of a separate notice.

E. R.

### THE NATURE OF GOTHIC.

*One of the very few necessary and inevitable utterances of the century.* That is William Morris' estimate of the matter, contained within this little book which Mr. George Allen is offering to the public for the sum of 1s. It is a reprint of a chapter from Ruskin's "Stones of Venice" which explains with marvellous insight and lucidity the real nature of Gothic architecture. It was a good idea to publish this notable chapter in this cheap and handy form, for it constitutes practically a complete treatise by itself and contains but few references to other parts of the book of which it forms a part. Moreover, it is a fine example of that combination of artistic and ethical teaching to which Ruskin's writings owe both their charm and their enduring influence. Such teaching as this chapter contains is not yet out of date, and one can imagine that many who have never read the "Stones of Venice," or the "Seven Lamps of Architecture," will learn from this booklet to look with new interest on the rude work of the old Gothic sculptors, and see in it the signs of a noble freedom which in these latter days we have lost. One may suppose, too, that many who have thought of Gothic architecture merely as a matter of gables and pointed arches will learn from this book something of its soul—its true inwardness as the modern phrase has it—as well as of its outward form. No doubt, also, many who are familiar with the original work will be glad to possess themselves of this reprint for the sake of the preface by William Morris, from which we have already quoted. The lesson which Ruskin here teaches is, according to Morris:

that art is the expression of man's pleasure in labour; that it is possible for man to rejoice in his work, for, strange as it may seem to us to-day, there have been times when he did rejoice in it; and, lastly, that unless man's work once again becomes a pleasure to him, the token of which change will be that beauty is once again a natural and necessary accompaniment of productive labour, all but the worthless must toil in pain, and therefore live in pain. So that the result of the thousands of years of man's effort on the earth must be general unhappiness and universal degradation—unhappiness and degradation, the conscious burden of which will grow in proportion to the growth of man's intelligence, knowledge, and power over material nature.

A number of the original illustrations are reproduced, but a number of others to which reference is made in the text are omitted. This is rather irritating to the reader; still one cannot expect everything for a shilling, and if the reader's interest is excited to such a degree that he forthwith purchases the whole work from which this is an extract, that perhaps is about the best thing that could happen.

"The Nature of Gothic," by John Ruskin, with a preface by William Morris. George Allen, 156, Charing Cross Road, London. Price 1s. net.

### Artisans' Dwellings in Manchester.

The Local Government Board having given their sanction to the City Council borrowing £10,000 for the erection of artisans' dwellings in Milk Street, and having also approved of the plans of the buildings, the Improvement Committee, at their meeting last Wednesday, were in a position to decide to advertise for tenders for the erection of the houses forthwith. The proposal is to build sixty-one tenements, in four blocks; on the dual principle.

## Under Discussion.

### PEOPLES PALACE ARCHITECTURAL SOCIETY.

A meeting of this Society was held on Saturday, April 29th, Mr. Francis R. Taylor in the chair. A paper was read by Mr. H. A. Darling on "Girder Construction." The author, in his opening remarks, said that some few years ago wrought-iron was almost universally used, it being cheaper than steel. At the present time, however, the more economical methods employed in the manufacture of steel have changed this, and it is now the exception to specify wrought-iron for structures, steel having taken its place. It was pointed out that rolled joists were uneconomical, especially for large spans, because of the section being uniform from end to end, and consequently no provision was made for the variation of the stresses to which the girder was subjected. This was to some extent remedied by the use of compound girders, but there was a great waste of material in many of the stock sections, the greatest waste occurring in the web. Plate girders were then considered, and the processes involved in the manufacture of the common types of iron and steel girders were described. On the conclusion of the paper a series of questions on practical details were asked and answered, and a vote of thanks was accorded by acclamation to the author. A paper on "Portland cement" was then read by Mr. Albert Grenville, which dealt with the manufacture, properties, and uses of the material. The paper was well illustrated with lantern slides, and on its conclusion a hearty vote of thanks was accorded to the lecturer. The meeting then adjourned.—The next visit will be made to the "Charterhouse," on Saturday, May 13th, through the kindness of Canon Haig Browne.

### EXCAVATIONS AT SILCHESTER.

An unusually large audience was attracted to a meeting of the Society of Antiquaries at Burlington House to hear the results of last year's excavations on the site of the Roman city of Silchester. The paper read on this subject by Messrs. W. H. St. John Hope and G. E. Fox was illustrated by plans and lantern slides. A large number of the antiquities found were also displayed on the table and walls. Conspicuous amongst these were a quern with its wooden handle still remaining intact, a sepulchral urn containing burnt human bones, a tile inscribed "Satis," the usual array of pottery, and some mosaic pavements. Amongst the pottery was a large amphora which created some amusement. In reply to an inquiry from a Fellow as to how the President knew that it was an amphora, he replied that it must be one because both its handles were missing. The insula (or rectangular blocks between the streets), explored in 1898, lie next the city wall on the south-west between the small postern gate in the west wall and the south gate. As the result of nine years' work twenty blocks, covering an area of 65 acres out of a total of 100 acres within the walls, have been explored, and all the buildings found therein plotted on the plan. Between insulae XIX. and XX. and the city wall is a triangular piece of land which was also excavated; insula XIX. proved to be decidedly the most interesting. It differed from all the other insulae in being entirely inclosed within a wall, measuring 384ft. from north to south and 271ft. from east to west. Within this inclosure was a remarkably fine house of the better class, built round a courtyard, and having the usual winter rooms heated by hypocausts. Adjoining the house on the south side was a large workshop, and in the yard outside were two water tanks. Mr. St. John Hope suggested that the tanks possibly indicated the existence of a tannery. The size and importance of the house may be gathered from the fact that it presented a frontage of 166ft. to the road. At the south-west corner of insula XIX. the sepulchral iron containing incinerated bones was discovered. At a depth of 1ft. 9in. below the foundations of the mansion in insula XIV.

were discovered the remains of an earlier house, built partly of timber, and having a very remarkable tessellated pavement. The design of the pavement indicates, Mr. G. E. Fox pointed out, that it probably dates from the 1st century A.D., and that therefore the house to which it belonged was, if his views were correct, the earliest yet found on the site. The ornament consists of elegant scrolls of foliage resembling the painted designs at Pompeii and on Samian ware, thus differing altogether from the later mosaic pavements in which the plait, or braidwork, and the Greek fret predominate. Mr. Alma Tadema agreed with Mr. G. E. Fox that the pavement was an attempt to imitate painting in Mosaic rather than the product of a true artist in Mosaic. In the discussion which followed, Mr. F. Haverfield said that the plan of the city as now revealed to him by the last nine years' excavation seemed to show that the builders copied a Celtic rather than an Italian model. Mr. C. H. Read, of the British Museum, called attention to the fact that none of the glass vessels dug up showed any trace of iridescence, which he attributed rather to the composition or fabric of the glass than to the conditions of their burial during the last thousand years. Sir Henry Howarth created much laughter by saying that he had for years been endeavouring to induce his friend Mr. Alma Tadema to turn his attention to Britain during the Roman occupation, and to choose as the subject for his next Academy picture a Roman General engaged in some such really noble work as driving the Picts and Scots beyond the Antonine Wall.

## New Companies.

### A. H. Lavers, Limited.

This company was registered on May 1st with a capital of £25,000 in £10 shares, to acquire, take over as a going concern, and carry on the business of a whiting manufacturer and brick, cement, and builders' material merchant now carried on by Alfred H. Lavers at Lavers Wharf, Nine Elms, London, S.W., and to enter into an agreement with the said vendors. The first subscribers (each with one share) are: Alfred H. Lavers, Lavers Wharf, Nine Elms, S.W., merchant; Thomas Ferguson, 1, Apple Road, Parson Green, S.W., builder; Charles W. Burdett, 63, Binfield Road, Clapham, London, S.W., traveller; George H. Franklin, 39, Patmore Street, Battersea, S.W., cashier; George B. Fenn, 129, Camberwell New Road, S.E., traveller; J. N. Everidge, Lovelace Road, Surbiton, S.W., builder; C. Stone, 15, Wellwinch Road, Milton, near Sittingbourne, Kent, waterman. Alfred H. Lavers is the governing director with £500 per annum. Qualification, £500. Remuneration of the ordinary directors (if any), £600 divided between them. Registered office, Lavers Wharf, Nine Elms, London, S.W.

### Isle of Walney Estates Co., Ltd.

This company was registered on April 29th, with a capital of £100,000 in £1 shares, to acquire any lands and buildings in the Island of Walney, in the borough of Barrow-in-Furness, Lancs., to enter into an agreement with John Poole, to develop and turn to account such lands and buildings and to carry on the business of land, estate and house owners and agents, builders, contractors, building material merchants, &c. The first subscribers (each with one share) are: Albert Vickers, 28, Victoria Street, S.W., gent.; S. Loewe, 32, Victoria Street, S.W., merchant; Frank Dawes, 50, Old Broad Street, E.C., solicitor; J. T. Paine, 32, Victoria Street, S.W., secretary; Arthur T. Dawson, 17, Mount Street, W., Lieut. R.N.; Arthur Lambart, 32, Victoria Street, S.W., Major, R.A.; and George T. Buckham, 32, Victoria Street, S.W., engineer. The number of directors is not to be less than three nor more than seven. The first are Albert Vickers, James Dunn, Alexander Adamson, George Pattinson and John Poole. Qualification, £1,000. Remuneration as fixed by the company.

**Sunderland Properties Company, Limited.**

This company was registered on April 27th, with a capital of £15,000 in £5 shares (of which 1000 are preference), to acquire, develop, turn to account, work and deal with freehold, copyhold, and leasehold lands, houses, buildings, ground rents, &c., in or near Sunderland or elsewhere. The number of the directors is not to be less than five nor more than twelve. The first are: Alexander Prosser, latter, of 20, Belle Vue Park, Sunderland; Grainger Heslop; John Mitchinson, chemist, of 6, White House Crescent, Sunderland; William C. Hetherington, engineer, of 12, Vicarage Terrace, Sunderland; and Lawrence Smith, marine superintendent, of 28, Lorne Terrace, Sunderland. Qualification, twenty shares. Remuneration, as the company may decide.

**Dunn, Bennett and Co., Limited.**

This company was registered on April 29th with a capital of £35,000 in £1 shares, to acquire and take over as a going concern the business now carried on by Thomas W. Bennett, William Dunn and Enoch Colclough at the Royal Victoria Works, Burslem, Staffs., as "Dunn, Bennett and Co." to enter into an agreement with the said vendors and to manufacture, sell and deal in earthenware, ironstone, pottery bricks, tiles, pipes, china, glass, porcelain, terra-cotta, ceramic ware, ironmongery, enamelled goods, hardware, etc. The first subscribers (each with one share) are:—James T. Mogridge, 10, Bartlett's Buildings, E.C., agent: Thomas W. Bennett, Royal Victoria Pottery, Burslem; potter: William Dunn, Bleak Hill, Burslem, potter: Enoch Colclough, Bank Hall, Burslem, gent: Alfred W. Bennett, Grove House, Burslem, potter: John W. Cooper, 13, Peel Street, Wolstanton, Stoke-on-Trent, clerk: and Spencer Lawton, J.P., Elm House, Burslem, valuer. The number of directors is not to be less than three nor more than seven. The first are:—Spencer Lawton, J.P., Thomas W. Bennett, William Dunn, J. T. Mogridge and A. L. Harkness. Qualification £200. Remuneration £20 each per annum and £30 for the chairman.

**West's Stourbridge Brick Co., Ltd.**

This company was registered on April 29th with a capital of £10,000 in £1 shares, to acquire, take over as a going concern, and carry on the business of firebrick, fireclay, brick and tile manufacturers and merchants, carried on at 5, 5A and 6, West End Lane, Kilburn, and Queen's Park Goods Station, West Kilburn, under the style of "West's Stourbridge Brick Company," and at Flora Wharf, 537 and 539, Harrow Road, W., under the style of "Warner and Co." The number of directors is not to be less than three nor more than seven. The first are Alfred H. Smith, Samuel J. Dainton, Charles Peach and Alfred J. West. Qualification, £100. Remuneration, £50 per annum, divided between them.

**John and Henry Cocks, Limited.**

This company was registered on May 2nd with a capital of £20,000 in £10 shares, to acquire, take over as a going concern, and carry on the business of builders, contractors, brewers' sign board contractors, decorators, and public-house, shop, and office fitters, now carried on under the style of "John and Henry Cocks, at 1, Frederick Place, and Grove Road, Mile End Road, E., and at 27, Arnold Road, Bow, London, E., and to enter into an agreement with William B. Read, Miss Mary C. Ivimey, and Miss Matilda J. Ivimey. The first subscribers (each with one share), are:—William B. Read, Station Road, Epping, gentleman; Miss Mary A. Ivimey, Blackwood, Harrogate, Yorks.; Miss Matilda J. Ivimey, 3, Bloomsbury Place, Brighton; John W. Woolfe, 18, Tubb Road, Leytonstone, traveller; Morris Gladwell, 44, Addington Road, Bow, E., superintendent of works; Arthur F. Gregory, Ashleigh, Teesdale Road, Leytonstone, clerk; Joseph Custard, 323, East India Dock Road, E., clerk. The first directors are:—William B. Read (governing director,

with £300 per annum), John W. Woolfe (governing director, with £50 per annum), Morris Gladwell, and Arthur F. Gregory (ordinary directors, with remuneration as the company may decide). Qualification, one share.

**Owen Stone Company, of Scotland, Limited.**

This company was registered in Edinburgh with a capital of £25,000 in £1 shares, to acquire the patent rights, properties, and effects formerly belonging to the Owen Stone Company (Limited), now in liquidation, and to carry on in Scotland, Northumberland, and the province of Ulster, the business of patent stone manufacturers, builders, contractors, decorators, and dealers in lime, bricks, timber, and other building materials. The first subscribers (each with one share) are John Kerr, 94, George Street, Edinburgh, contractor; Robert Kitchen, Bonnyrigg, Midlothian, builder; Gordon Stuart, 56, Frederick Street, Edinburgh, W.S.; James Annandale, Polton, paper maker; James Romanes, 44, Queen Street, Edinburgh, C.A.; George Reedman, 8, Mary Place, Edinburgh, advocate; John Romanes, 44, Queen Street, Edinburgh, writer to the signet. The first directors (to number not less than three nor more than seven) are: James Annandale, G. Blyth, John Kerr, Robert Kitchen, Robert Muir, G. Reedman, and James Romanes. Qualification, 250 shares. Remuneration, as the company may decide.

**Property Alliance, Limited.**

This company was registered on May 3rd, with a capital of £250,000 in £1 shares, to acquire by purchase, lease, exchange or otherwise, lands, buildings, flats, houses, mansions, &c., in London or elsewhere, to develop and to turn to account the same by preparing building sites and by constructing, reconstructing, pulling down, altering, improving, decorating, furnishing, and maintaining offices, flats, houses, factories, cellars, warehouses, shops, wharves, buildings, &c., and to advance money to builders, tenants, and others. The first subscribers (each with one share) are: Israel Hart, Bart., Leicester; Lewis H. Isaacs, 5, Verulam Buildings, Gray's Inn, surveyor; Lewin Solomon, 55, New Broad Street, E.C., architect; John Law, Holly Bank, West Ewell, gentleman; E. C. Arnold, 24, Portland Place, W., Captain of Militia; J. S. Rubenstein, 5, Raymond Buildings, Gray's Inn, solicitor; and William Leggatt, 5, Raymond Buildings, Gray's Inn, solicitor. The number of directors is not to be less than three nor more than seven; the subscribers are to appoint the first. Qualification, £250. Remuneration, £450 per annum and a share in the profits divided between them. Registered Office, 24, Victoria Street, Westminster.

**Queen's Gate Mansions Limited.**

This company was registered on May 4th with a capital of £12,000 in £1 shares, to carry on at or near Hyde Park, London, or elsewhere, the business of proprietors of residential mansions, also hotel, boarding house, and tavern keepers, job masters, bath proprietors, &c. The first subscribers (each with one share) are: Percy W. Evennett, 19, Southwold Road, Upper Clapton, clerk; F. A. Dawson, 43, Lausanne Road, Peckham, S.E., accountant; Frank G. Exell, 6, Valley Road, Streatham, S.W., clerk; Frank H. Kent, 18, Stanwich Road, Stamford Hill, N., clerk; Frederick W. Stiff, 7, Hazelville Road, Hornsey-rise, N., clerk; Frank H. Strange, -36, Northcote Road, Croydon, clerk; and William H. Bustard, 134, St. Stephen's Road, Upton Park, E., secretary. The number of directors is not to be less than two nor more than five; the first are William Kirby and others to be appointed by the subscribers. No qualification. Remuneration as fixed by the company.

The Southwark Art Exhibition is to remain open till May 28th, including Sundays.

**Keystones.**

**The Construction of Roads** upon the Castelnau Estate at Mortlake is being carried out under the supervision of Mr. Robert Willey, of 33, New Bridge Street, London, E.C. The outlay will be about £3,000.

**New City Institute.**—The Bishop of London last Wednesday afternoon laid the foundation stone of a new school and technical institute, under a scheme of the Charity Commissioners, in connection with Sir John Cass's School at Aldgate, founded in 1710.

**A New Temple for Ilfracombe Freemasons.**—The foundation-stone of a new temple for the members of the Lodge Concord, 1135, was laid at Ilfracombe last Wednesday. The site is in Northfield Road, and the building is being erected from designs by Mr. H. M. Gardner.

**New Schools for Peebles.**—At a special meeting of the Peebles School Board it was unanimously resolved to feu from Lord Elibank three acres of ground at Kingsland, Peebles, on which to erect an elementary school to accommodate 600 children, at an estimated cost of £8,000.

**A Discovery in Oxford Street.**—During some recent excavations along Oxford Street, London, W., the workmen came upon quite a number of the ancient wooden pipes, formerly used to convey water through the streets of London. They consist of small elm trees, bored with a hole 6in. in diameter.

**A New Graving Dock.**—The new graving dock at the Canada Dock, Liverpool, has been formally opened. It contains 3,226,648 cubic feet of water, and can be emptied at the rate of 922 tons a minute. The pumping installation consists of three centrifugal pumps, each of 51in. diameter and capable of discharging 1,000 tons a minute if necessary.

**The Richmond and District Victoria Hospital.** erected as a memorial of the Diamond Jubilee, has just been formally opened. The building is one storey high and comprises two wards, each having three beds, for males and females respectively. There is a special ward with a single bed. The architects are Messrs. Clark and Moscrop, of Dartington.

**The Lucknow Memorial.**—A monument, erected by the officers and men of the Duke of Cornwall's Light Infantry to their predecessors, the gallant 32nd Foot Regiment, to commemorate their share in the defence of the Residency, was unveiled recently by Lady Inglis. The memorial has been erected on the lawn facing the main Residency building, and consists of two huge blocks of Cornish granite from the Bosahan Quarry, near Penryn, with suitable inscriptions on both sides.

## SEWAGE DISPOSAL.\*

By D. BALFOUR, M.Inst.C.E., F.G.S.

(Continued from page cx.)

THE separate system of sewers on the intermittent system of disposal affords the minimum size of sewers and quantity of land and volume of water in obtaining a simple and economical scheme. In America the Massachusetts State Board of Health had chiefly used intermittent land filtration and partly chemical processes. Owing to various public authorities letting sewage disposal works to a tenant, whose object is profit and not purification, both deterioration and disgrace are invariably the results of such schemes. Land, fully satisfactory in quantity, quality, levels, cost, and relative situation, being sometimes difficult to obtain in certain localities, considerable help can now be obtained by the conjoined use of certain simple chemicals in greater or less proportions for the precipitation of the solid or sedimentary matters before application to land. The chief chemical used for this purpose at the present time is aluminiferous (a crude product of alum), which is simple, cheap, and entirely soluble, causing, therefore, no extra sludge. During the last ten to twenty years the list of patent chemicals for sewage treatment extended to about seventy or eighty in number, and only comparatively few survive in practice.

The Local Government Board's regulation provides for 1 acre of land per 1500 to 2000 of population where combined chemical and land filtration is adopted, and 1 acre to 500 to 1000 population where the principle adopted is broad irrigation with chemicals.

## Bacteriological Methods.

The bacteriological treatment of sewage has been for the last few years receiving new and special experimental investigation and scientific discussion. Bacteria tanks for fully facilitating the practical development and action of these micro-organisms have, within the past years, been constructed and are in operation, comprising those for special action of Aerobic micro-organisms by anti-septic or oxidising agency, for which light and air are both essential, and also those tanks for the action of Anaerobic micro-organisms by septic or putrefactive agency, from which light and air are both excluded, with either intermittent or continuous action.

The special objects of the bacteria tanks are the liquefaction of the solids or sludge in crude sewage, without treatment by chemicals or land, and the ample and ultimate purification of the resultant liquid, so as to meet satisfactory standards of purification.

In order to practically develop the important agency in sewage purification, which, it has been discovered, is possessed by the minute but "mighty atom" as already stated, various bacteria tanks are now exhibited, all of which I have specially inspected on several occasions.

Varied degrees respectively of purification and of constructive and working cost are claimed, as well as no chemicals needed, and no sludge produced, and I find the tanks generally are based on an average daily flow of one million gallons of sewage per acre of filter, or about 200 gallons per square yard.

The Dibden System, as designed by Messrs. Dibden and Thudicum, formerly chief chemists to the London County Council, I have seen first at the London Sewage Outfall Works, on the north bank of the Thames at Barking, and afterwards at Sutton (Surrey), Hampton (Middlesex), and at Leeds City Outfall Works.

This system comprises from five to ten sets of two tanks, both of which are open, on Aerobic principles, the first tank being 3ft. to 4ft. deep of rough, or  $\frac{1}{2}$  in. clinker, coke breeze, or ballast, and the second tank of fine, or  $\frac{1}{4}$  in. like material, worked by intermittent flow during cycles of six to eight hours. The final effluent at Sutton is further used on land growing mint crops. The analyses of the Leeds experiments have been verified by Mr. Fairley,

City Analyst, and the West Riding Rivers Board, and carp appear to thrive in the effluent flow.

The Septic Tank System, as designed and patented by Mr. D. Cameron, City surveyor, Exeter, I have seen there, as also the recent full installation at Barrhead, near Glasgow. The sewage is received on the continuous flow principle, first into the covered or septic chamber, where light and air are excluded for liquefaction by Anaerobic agency, but generating a quantity of inflammable marsh gas. The effluent then overflows into an open tank 4ft. to 5ft. deep, of fine clinker, or coke, which is Aerobic and intermittent in action, the discharge being intended to be regulated by patented automatic gear.

The effluent has been analysed and reported on by Drs. Dupre, Rideal, and Mr. Dibden.

In the Dibden and Cameron systems the first tank breaks down and liquefies the solid matter or sludge, while the second tank effects the final purification of the sewage.

The Aerated Bacterial Self-acting Filter is a simple tank, which was patented by Colonel Ducat, R.E., for many years an Engineering Inspector of the Local Government Board, and which I have on many occasions examined at Hendon, in the North of London. This tank is altogether on the self-acting, continuous flow principle, without any valves, and has special aeration and thermal arrangements. The tank is filled with  $\frac{1}{2}$  in. to  $\frac{3}{4}$  in. clinker, 8ft. in depth. The analyses have been conducted by Dr. Houston and Dr. Klein, both eminent chemists and bacteriologists. Several gold fish appear to thrive in the daily effluent flow.

Instead of solid walls used in other systems, the Ducat tank has its sides constructed of open drain pipes, built in concrete, with alternate layers of through-going pipes every 18 in. in depth, by means of which the air is supplied both laterally and vertically to obtain continuous action without rest by intermittent use. In winter heating arrangements are considered important, and of a simple and cheap nature. It appears to me most desirable for sewage to be purified on a system of continuous flow, thereby dispensing with valves and any great extent of supervision.

Whittaker and Bryant's Thermal Aerobic Sewage Filter I have seen in operation both at Accrington and also at Leeds.

The crude sewage is first received into an open tank, and thence raised by a pulsometer steam pump, which also heats the sewage, and at Leeds it is further heated from a steam pipe. The heated sewage is, by means of an automatic revolving sprinkler, distributed over an open mass of 9ft. depth of coarse coke or clinker, freely exposed to the air at the sides and on continuous flow principle.

The Bennett Anaerobic and Aerobic Tank, only lately designed by Mr. Bennett, borough engineer, Southampton, comprises, first, a 3 $\frac{1}{2}$ ft. deep tank filled with clinker, covered over to exclude light and air. The second tank is open and 3ft. deep, similarly fitted with clinker. Small fall is claimed as necessary with continuous flow for the two tanks without a number of special sets of tanks in a series.

Some other designs of bacterial tanks have been, so far introduced, but as yet with lesser public mention.

As regards standard of purification for sewage, it appears left as yet discretionary, but as a working standard it is usually taken as 0.1 grain per gallon of albuminoid ammonia and 1 grain per gallon of oxygen absorbed at 80deg. F. in two hours. Both the West Riding of Yorkshire and Mersey and Irwell Rivers Boards have adopted this basis.

In conclusion, I think it would be invidious and unfair at the present time to compare the various systems of bacterial tanks practically and financially, from the fact that a Royal Commission has been appointed on sewage disposal, and is now pursuing special investigation of the subject, and I have been professionally desired to give evidence before the Commission.

The Commission have had over twenty-five expert witnesses before them, including chemists, bacteriologists, biologists, medical

officers of health, and engineers, some of these witnesses having occupied the time of the Commission for two days each. Members of the Commission have visited the works of sewage disposal at the following places: Exeter, Yeovil, Manchester, Rochdale, Chorley, Sutton, Doncaster, Dewsbury, Bradford, and Leeds. They have also been engaged in determining a number of important questions relating to the desirability or not of laying down chemical and bacteriological standards which should be obtained by effluents, whether in the case of domestic sewage only, or for such sewage combined with trade refuse. For this purpose they have employed experts of their own, and it is understood that the staff of chemists and bacteriologists has just been increased, so that the effluent from works of different character can be systematically studied almost hourly, by day and by night, under varying conditions of temperature and rainfall. No statement can as yet be made as to the term over which those experiments must extend, but it is quite clear that they are at present only in an initial stage and that, in so far as bacteriological results are concerned, the Commission are dealing with a subject as to which little expert evidence is available, and that the matter will have to be examined very deliberately and exhaustively before useful inferences can be drawn. These experiments are being carried out under the supervision of a committee of the Royal Commission consisting of Sir Richard Thorne, F.R.S., Professor Michael Foster, F.R.S., and Professor Ramsay, F.R.S.

I would only add, now that the Rivers Pollution Prevention Acts (applicable to the three kingdoms) have come into practical force, it is certainly most particularly opportune and advantageous to public authorities to possess (as I hope will soon be fully realised) other sufficient and less costly means than those hitherto officially adopted for sewage purification, and combining the great cardinal points of the day—simplicity, efficiency, and economy.

**The National Footpaths Preservation Society** held its annual meeting last week. It was announced in the report that the parish council in the locality had consented to exercise rights of ownership in the public interest to the thirty acres of plantation land on Rockbeare Hill, Devonshire, recently presented to the Society. Amalgamation with the Commons Preservation Society was agreed on.

**A New Road at Coventry.**—The Coventry Town Council last week adopted a report of their committee agreeing to pay £700 towards the cost of a new road which is to give access to the railway station from the east of the city. Mr. W. J. Iliffe is developing part of Lord Chylesmore's Park estate, and the Council propose to spend the money in widening one of the roads he is making, and carrying it some distance further than he intended.

**Tramway Scheme at Dewsbury.**—An electric tramway scheme to connect Dewsbury, Heckmondwike, and Cleckheaton, and possibly Ravensthorpe and Mirfield, is being considered by the local authorities of the three first-named towns. The line will pass through the Spen Valley, and will, therefore, traverse part of Liversedge, whose support it is hoped to obtain. The project will be in opposition to that of the British Electric Traction Company, of which the Clerk to the Liversedge Council is one of the local agents.

**Proposed New Workhouse for Wolverhampton.**—An inquiry was held at Wolverhampton last week by one of the inspectors of the Local Government Board into an application made by the Board of Guardians to borrow £140,000 to erect a new workhouse at Wednesfield. The maximum which the Guardians would be entitled to borrow was £195,027. They did not anticipate that the new workhouse would cost £140,000, but a margin for contingencies was required. Since the original estimate had been sent in they had reconsidered their scheme, and decided to add a chapel, which would bring the cost of the buildings up to £119,668. There was no opposition.

\* A Paper read before the Sanitary Inspectors' Association on April 8th.

## THE DISPUTE IN THE BUILDING TRADE.

THE dispute still drags along at a weary pace, and very little has been accomplished since the resolution of the Yorkshire masters to lock out 25 per cent. of the union men in employment. General approval has been expressed all over the country by the masters at this decision. In some quarters the men decided that if the Federated Masters carried out the lock-out resolution they would retaliate by withdrawing the remaining 75 per cent. This was done in Leeds by the bricklayers, who, however, eventually gave in and returned to work. The views of the employers have been summarised as follows, and where the men have been locked out it may be taken that a condition of re-engagement will be the acceptance of these rules:—

1. No attempt on the part of the operatives in any department of the building trade shall be made to compel foremen, or working foremen, to join the men's union.

2. No limitation shall be placed on the number of apprentices employed by any firm, and all apprentices and boys learning a trade shall be legally bound within three months of commencing to work, and to remain until the age of twenty-one years.

3. Every workman shall be free to belong to a trade union or not, as he may think fit.

Every employer shall be free to employ any man, whether he belong to a trade union or not.

Every workman who elects to work for a federated firm shall work peaceably and harmoniously with all fellow employees, whether he or they belong to a trade union or not.

The Federation do not advise their members to object to union workmen or give preference to non-union workmen.

4. The employer in all cases shall have the right to decide who shall do certain work.

5. No restriction shall be placed by the workmen on any employer as to how or where he shall purchase his material, or as to whether it shall be worked or partly worked when it comes on to a job.

6. With a view to avoid disputes in future, deputations of workmen will be received by their employers, by appointment, for mutual discussion of questions, in the settlement of which both parties are directly concerned. In case of disagreement the local associations of employers will negotiate with the local officials of the trade unions. Failing settlement by the local associations and trade union, the matter shall be referred to the central authority of the masters and workmen. That there be no stoppage of work during negotiations.

7. No walking delegate of the men shall be allowed to come on to any job, or to visit any workshops during working hours.

8. No overtime shall be reckoned until a full working week shall have been worked as per the agreed working rules between masters and workmen in each district.

9. A workman shall not take work from any customer of his employer, or work for any other person whilst in such employment.

10. Employers shall be free to employ workmen at rates of wages mutually satisfactory. They do not object to unions or any other body of workmen in their collective capacity arranging among themselves rates of wages at which they will accept work, but while admitting this position they decline to enforce a rule of any society, or an agreement between any society and its members.

The unions will not interfere in any way with the wages of workmen outside their own unions.

11. Both masters and workmen shall give six months' notice, to expire on March 1st and October 1, of any alterations of rules or rates of wages.

The National Amalgamated Society of Operative House and Ship Painters and Decorators have sent a very strongly worded letter in answer to the Master Builders' Association's request for an assurance that the members have no sympathy with, and will not support in any way, the National Association of Operative Plasterers in the present dispute. They say they entirely repudiate the right of the master builders to dictate to the members to whom they shall extend their sympathy and support, and add:—"We are given to understand that one of the main causes of the dispute in the plastering trade is that the employers call upon the men to give an assurance that certain objectionable practices shall cease. Whatever objectionable practices the Operative Plasterers may have carried out in the past, surely none could be more objectionable or humiliating than the latest move of the Master Builders' Association. We regret that your association have not dealt with this matter with that prudence and forethought which has characterised them in the past. We do not admit the legal or moral right of the master builders to demand such an assurance as is asked for. We therefore respectfully decline to place the liberties we enjoy at the

mercy of the Master Builders' Association, and refuse to comply with their request."

A meeting of the members of the Midland Federation of Master Builders was held at Derby on the 9th inst. to consider the crisis. Although there was considerable discussion in regard to the latest developments nothing definite was decided upon.

The Lancashire and Cheshire Federation of Employers met at Manchester on the 11th inst. and expressed approval of the action of the Yorkshire employers. In view of the near approach of a special meeting of the National Federation at Birmingham on the 18th inst. it was considered advisable not to declare a lock-out; but should the latter body show any hesitancy in the matter it appears likely from the tone of the gathering in Manchester that the northern counties will follow the independent example already set by Yorkshire.

Considerable excitement was evinced at Hull on the 11th inst. on the arrival of a batch of non-Union bricklayers from Ireland, they having been offered work by the local officials of the Master Builders' Association. Several of the men on hearing of the dispute, of which they were unaware, asked for their fare back.

The weekly report of the general secretary of the Operative Plasterers' Society (Mr. Dellar) was issued yesterday. It states that on Saturday, the 6th inst., there were 1691 locked-out men on the books, as compared with 1620 on April 29th. This increase is stated to be owing to local disputes at Southport and Swansea. In the former town there are forty-six men out, and in Swansea fifty-four. Apart from these disputes, there would have been 1591 on the books, or a decrease of twenty-nine as compared with the previous week.

A meeting of members of the Leeds branches of the Amalgamated Society of Carpenters and Joiners was held at the Grand Assembly Rooms, New Briggate, last Thursday, to take into consideration the advisability of laying a levy in aid of the 25 per cent. of members locked out. The attendance numbered fully 1100 out of a total membership of 1286. The proceedings were characterised by enthusiasm, and it was unanimously resolved that the levy be 4s. per member per week. Many of the undischarged bricklayers in the city have returned to work by order of the Executive Council. About twenty-five of the locked-out men, chiefly belonging to the London Order, left for York yesterday. Five plasterers also took their departure for various places in the country, and six more are expected to go away on Monday.

**The Surveyors' Institute.**—The annual dinner of the Surveyors' Institute was held at the Holborn Restaurant last Wednesday, when Mr. Robert Vigers (president) occupied the chair. After the usual loyal toasts had been proposed the chairman gave the toast of "The Houses of Lords and Commons," to which Lord Templeton and the Speaker replied; the latter observed, in a humorous speech, that the Commons deserved as much favour at their hands as the Lords. He could assure them from personal knowledge that a large amount of the time of the Commons was spent in looking after the interests of the surveyors. Of the scheme of clearance for the new land for the Government offices he believed the real secret was the improvement of the position of the Surveyors' Institute in Great George Street. (Laughter.) Some of his pleasantest recollections were connected with the Institute, as within its walls he had earned his last guinea for making a speech.—The toast of the evening, "The Surveyors' Institute," was proposed by Mr. Jesse Collings, M.P., who said that the Institute now numbered 3,000 members, and occupied a position second to none among London and Provincial Societies. He trusted that before the end of another year they would be able to occupy their new premises in Great George Street, which had been erected at a cost of nearly £40,000.—The President replied, and the toasts of "Kindred Societies" and "The Visitors" were afterwards proposed.

## Masters and Men.

**Helensburgh Joiners** have gained  $\frac{1}{2}$ d. per hour advance in their wages.

**Edinburgh Plumbers** are agitating for an advance of  $\frac{1}{2}$ d. per hour on their present rate, which is 8 $\frac{1}{2}$ d.

**Coalville Joiners** are still on strike for an advance of  $\frac{1}{2}$ d. per hour. One or two of the smaller employers have conceded their demand, but the principal firms are displaying a firm tone.

**Ludlow Carpenters' Dispute Settled.**—The members of the Amalgamated Society of Carpenters and Joiners, who struck for an advance of wages, have come to an arrangement by which they will receive  $\frac{1}{2}$ d. per hour increase, and have returned to work.

**Elland Labourers**, to the number of about fifty, employed at the engineering works of Messrs Dempster and Co., of Rosemount Works, Elland, struck work last week for an increase of wages to the extent of 2s. a week. Their present wage is, they state, 18s. a week.

**The Dispute at Chester** has been settled, the men having agreed to accept the following concessions: carpenters and joiners  $\frac{1}{2}$ d. per hour advance from May 1st, winter term to commence November 1st and to end February 29th, the hours being seven to five. Bricklayers accept  $\frac{1}{2}$ d. per hour advance from June 1st.

**Carpenters, Joiners and Bricklayers at Chester.**—A dispute at Chester has just been amicably settled. The carpenters and joiners demanded an advance of 1d. per hour, and served notices, expiring on May 1st. The masters decided to concede  $\frac{1}{2}$ d. per hour, and this the men have accepted. The bricklayers have accepted a similar offer.

**Masons' Wages at Cardiff.**—At a meeting of the Cardiff Town Council it was proposed that the wages of the masons in the employ of the Corporation be increased one halfpenny per hour from May 1st, and that they be permitted one hour for dinner all the year round, and permitted to cease work at noon on Saturdays. A letter was read from the Master Builders' Association stating that the condition of the trade would not warrant an increase of wages. Upon a division the resolution was carried by a majority of seventeen votes to five.

**A Meeting of Aberdeen Monumental Masons** was held last week. The meeting had under consideration the question of the advisability of wages being paid weekly instead of fortnightly, as at present. The reply from the Granite Association refusing to concede the demand for weekly payments without the decision of an arbiter was submitted, and it was unanimously agreed to obtain the opinion of the arbiter on this point. In accordance with notice previously given, the meeting had also under consideration the question of an increase of wages. The operatives were unanimously of opinion that the present rate of wages should be increased, but it was decided that in the meantime the matter should be deferred. The present rate of pay for monumental masons is 7d. per hour.

**Sheffield Street Improvements.**—At a meeting of the Sheffield City Council, the offer of the Great Central Railway Co. to give up 1,388 square yards of land in Broad Oaks, Attercliffe, for road widening purposes, was accepted, the company to be relieved of the cost of the making, paving, and dedication of the 40ft. street adjoining. The Council have under consideration the purchasing of land for street widening in Angel Street, King Street, Attercliffe Road, Upwell Street, Abbeydale Road, and Eccleshall Road.

## Engineering Notes.

**The New Schools, Mold,** are being warmed and ventilated by means of Shorlands' patent Manchester Grates, supplied by Messrs. E. H. Shorland and Brother, of Manchester.

**The Hambledon Schools, Henley-on-Thames,** are being ventilated by means of Shorland's patent Exhaust Roof Ventilators and Special Inlet Panels, supplied by Messrs. E. H. Shorland and Brother, of Manchester.

**Proposed Tunnel between Great Britain and Ireland.**—Advocates of the scheme for connecting Great Britain and Ireland by means of a channel tunnel have resolved to form themselves into a committee, with the view of pressing the subject upon the attention of the Government.

**City of London Electric Lighting.**—A report on the question of the electric lighting contracts with the City of London Electric Lighting Co., which, in counsel's opinion, are null and void, was submitted to last Thursday's meeting of the Court of Common Council by the Streets Committee. It was resolved to authorise the committee to have a conference with the directors of the company, and to report the result.

**Overhead Electric Traction in London.**—A report was submitted by the Highways Committee of the London County Council at a meeting of that body last week, on the application of the London United Tramways Co. to be allowed to use the overhead system of electric traction on that portion of their lines which comes within the county at Hammersmith. Consideration of the matter was adjourned until the next meeting of the Council.

**Calcutta New Catholic Schools.**—Efficient and regular ventilation in India is almost one of the necessities of existence, and cannot be ignored or left to chance, as is so often the case in England. The scheme of ventilation of the new Catholic Schools was a matter for careful consideration, and the decision has been in favour of John King Limited, Ventilating Engineers, Liverpool, who have received the order to supply their ventilating appliances.

**Proposed Harbour at Kirkcaldy.**—A meeting of the Kirkcaldy Town Council was held on the 8th inst., at which it was proposed that Mr. Conacher, the manager of the North British Railway, be approached with the proposal that the town, as their half of the expense of the new harbour, contribute £100,000, or a rate equivalent to that sum, and hand over the present harbour, valued at £150,000, or a sum to be fixed by a valuator, the town having an equal share in the management with the Railway Company. It was moved that in the event of the Railway Company being willing to make a suitable harbour at Kirkcaldy at their own expense, the town should sell to them the present harbour at a sum fixed by arbitration.

**Electricity at Calcutta.**—The directors of the Calcutta Electric Supply Corporation, Limited, in their report, state that the contractors have made good progress with the erection and equipment of the generating station and with the laying of mains. Possession of the site was not obtained until March 10, 1898, and the work of erection was not actually started until May 19. The buildings were, however, practically finished at the end of last year, and are reported to be a good example of a central station, comparing favourably with any station in this country. Owing to the difficulty of settling the question of the overhead wires with the Government, labour troubles and delay in delivery of some of the materials for the mains, the supply of electrical energy to the public was not commenced as early as was originally contemplated, but the works were opened and current was started recently.

## Builders' Notes.

**A Building Dispute.**—At the Shrewsbury County Court, on the 9th inst., his Honour Judge Harris Lee heard a case in which the plaintiff was Charlotte Jane Tommy, trading as Tommy Brothers, builders, of Wem, and the defendant James Wallace, of Overmoor, near Astley. The claim was for £70, balance said to be due under a contract for the erection of a new house for the defendant at Overmoor, and there was a set-off for £40 for alleged defective work, and £105 for delay in the completion of the contract. The defendant had paid £36 into Court. The case was sent for hearing from the High Court. Plaintiff claimed upon the architect's certificate, and denied the allegations as to defective work and needless delay. His Honour gave judgment for the sum paid into Court.

**A Contractor and his Buildings.**—At the Clydebank Police Court, on May 8th, James Goldie, who has the contract for the Clydebank section of the Glasgow Corporation Sewage Scheme, was charged with proceeding with the erection of a brick building facing Dumbarton Road without having the necessary warrant from the Dean of Guild Court. Accused stated that he had been authorised by the Glasgow Corporation to make the building, and as he was but a servant he thought that if there had been any formalities to go through they should have arranged them. He was quite prepared to act up to the rules of the burgh, and to do anything that was necessary on his part to do. On his promising to have a petition and plans of the building lodged that night the case was adjourned.

**Building without Municipal Sanction.**—At the Aberdeen Police Court, Bailie Taylor on the Bench, the case of David Simpson, painter, of 22, South Mount Street, Aberdeen, which had been adjourned several times, came up again. The charge was one of having contravened the Aberdeen Corporation Acts, by building two houses in Ashgrove Road, Aberdeen, which projected several feet further into the street than was shown on the sanctioned plan. Mr. R. C. Jackson, solicitor, appeared on behalf of accused, who had previously pleaded guilty. Mr. Jackson wished to withdraw this plea and substitute one of not guilty, on the ground that facts and circumstances had since come to accused's knowledge which had induced him to believe that he was really not guilty of the charge. The Town Council, he contended, in making the line of the street had absorbed a considerable portion of his land. Mr. Lamb, Procurator-Fiscal, objected to the plea being withdrawn, and the objection was upheld by Bailie Taylor. A fine of 30s., and 35s. costs, was imposed, the alternative being five days' imprisonment.

**Extensions in Aberdeen** are progressing rapidly, and the building trade generally is busy. Two new churches are being built in the Stocket district, and three new public schools are being erected in various parts of the city. Several buildings in course of construction are almost finished, among which may be mentioned the following: Large warehouse in Bridge Street, Messrs. Harper and Sutherland, architects, Aberdeen; spirit merchant's warehouse, Regent Quay, and reconstruction of Queen's Restaurant, Union Street, Mr. A. M. Mackenzie, A.R.S.A., architect, Aberdeen; ice factory, Poyernook Road, granite works at Ashgrove Road and Balmoral Road, and extension of City Hospital, Mr. John Rust, architect. Messrs. Pringle and Slessor, masons, have commenced the reconstruction of a large warehouse at Bridge Place and Windmill Brae, which was destroyed by fire on April 22. Mr. John Rust, Aberdeen, is architect for the work, which will cost about £9,000. Contracts have been entered into for construction of a district hospital at Stocket, just beyond the city boundary; Mr. J. D. Watson, county engineer, is the architect

and the estimated total cost is £3,619 7s. 9d. A new cemetery is intended to be laid out at Cragieshaw, from designs by Messrs. Walker and Duncan, C.E., Aberdeen; and it is also proposed to enlarge Trinity Cemetery. Mr. W. Kelly, architect, reports that the cost of reconstructing and enlarging the East Poorhouse would be £30,000, while the expense of building a new poorhouse for all the indoor ordinary paupers in the city would be £54,900, including cost of ground.

**The Purchase of Spitalfields Market Approved.**—A committee of the House of Commons, presided over by Mr. A. H. Brown, have had under consideration the General Powers Bill of the London County Council, one of the objects of which is to enable the Council to purchase by agreement the freehold of the land forming the site of Spitalfields Market and some adjoining property. Mr. Worsley-Taylor, Q.C., who appeared for the County Council, stated that complaints had for a long time been made respecting the obstruction of general traffic caused by the market, and also with regard to the character of the buildings of which it was partly composed. The Corporation of London had petitioned against the Bill, stating that they were the market authority in the City and that, as such, their jurisdiction extended over so much of the metropolis as was within a radius of seven miles from the City. They denied that the acquisition of the freehold of Spitalfields Market by the County Council would be effectual in improving the neighbourhood, and said that the real object of the proposal was to confer on that body such a *status* in relation to one of the London markets as might enable it to intervene in matters relating to markets generally, including those within the area of the City. A conference took place between representatives of the County Council and the City, and subsequently Mr. Littler, Q.C., stated that the parties had come to terms, but he wished it to be distinctly understood that the City Corporation did not in the slightest degree recognise that the purchase of the property gave the County Council any authority or *status* as a market authority. Some formal evidence having been taken, the committee decided that the portion of the preamble relating to the purchase of Spitalfields Market was proved.

**Infringement of Building Bye-laws at Prestwich.**—At the Prestwich County Court, on May 11, before Mr. Yates and other magistrates, William Wilkinson, of Rainsough, Prestwich, was summoned at the instance of the Prestwich Urban District Council for erecting a new building without having obtained the consent of the Council. Mr. Orford, who prosecuted, said the building had been erected over a sewer. The defendant had submitted a plan of the structure, but the Council refused to sanction it. He proceeded with the work, although twice warned by the surveyor not to do so. The matter was brought before the Buildings Committee of the Council and he (Mr. Orford) was instructed to prosecute. Before commencing proceedings, he wrote informing the defendant that if he persisted in going on with the work he did so at his own risk. The work was still being proceeded with. Evidence was given by the surveyor to the Council, who admitted in cross-examination by Mr. Jordan (who defended) that the sewer was 10ft. or 11ft. below the cellar of the house. Mr. Jordan contended that the defendant had been summoned more because the dignity of the Council had been offended than for any injury he had done. He submitted that other people had built houses over the same sewer and had not been interfered with. Mr. Orford said the Council felt that defendant had coolly disregarded their views, and that it would be futile to require plans or enforce the provisions of the Public Health Act on others if his case was to be passed over. The defendant was fined 40s. and costs, with a continuing penalty of 20s. per day until he either takes the house down or comes to an arrangement with the Council.

# Surveying and Sanitary Notes.

**Sanitary Condition of Florence.**—A recent Foreign Office report gives a very satisfactory account of the sanitary state of affairs in this beautiful city. The drainage is provided for by many large sewers, leading to three mains, which discharge into the river. The cleansing of the streets is leased out to private firms, and refuse depôts are situated away from the city.

**Widening of Thames Street.**—A meeting of the Court of Common Council was held last Thursday, at which the Finance and Improvements Committee submitted for approval a plan for making Lower Thames Street 60ft. wide between Botolph Lane and Fish Street Hill, at an estimated cost of £199,000, toward which the London County Council has agreed to contribute £50,000. The report was carried.

**Radcliffe Sewerage Scheme.**—A meeting of the District Council was held last week, at which a report was read from the Local Government Board regarding the application of the Council for sanction to borrow £3,000 for works of sewerage. The Board said they understood that it was not proposed to take into the sewers the drainage from the Grammar School and houses in Ringley Road. The Inspector reported that the sewage of those premises was at present discharged into ponds and tanks, which communicated by means of ditches and field drains with the watercourse near Mr. Barlow's dyeworks. The Board were advised that the scheme should be extended so as to deal with the sewage from the buildings referred to, and thus put an end to the pollution of the River Irwell by this volume of sewage.

**Worcester Improvements.**—The Hop Market Guardians met at the Hop Market Hotel last week to receive a deputation from the City Council with reference to the further widening of the Foregate. Arrangements have already been made between the two bodies, which provide for the Hop Market Hotel and two shops adjoining being set back

8ft. 10in. Plans have been prepared and accepted, and building operations commenced in the rear of the market, but the Council now desire to set the hotel back 22ft. The Guardians objected to the serious encroachment on their market yard, but agreed to the appointment of a committee to consider with the deputation the details of the scheme. A scheme has been decided upon which will practically make the Foregate as wide as at the Cross and the Foregate Street. Reports and plans will be submitted to special meetings of the Board and the Council.

**Dispute about Sewers.**—In the Chancery Division of the High Court of Justice, on May 9th, Mr. Justice Kekewich heard the case of the Vestry of the Parish of St. Mary, Islington, v. The Hornsey Urban District Council. The object of this action was to compel the defendants to disconnect the sewers in their district from a sewer belonging to the plaintiffs in the Stroud Green Road, North London, and to restrain the defendants from permitting any future connection of drains or sewers in their district with the said Stroud Green Road sewer.—The plaintiffs alleged that after heavy rains the discharge of the additional sewage and surface water from the sewers in several roads in the Hornsey district choked up the Stroud Green Road sewer, and rendered it incapable of carrying off the sewage and surface water from that part of the Parish of St. Mary, Islington, which, as the plaintiffs alleged, it was constructed to drain, so that serious floodings had been caused, endangering the health and property of the inhabitants and ratepayers of that parish. This led to the present action.—The defendants denied that the sewer in question was constructed for the sole benefit of the Parish of St. Mary, Islington, and asserted that it was constructed partly at the expense of the owners of property in the defendants' district abutting on the Stroud Green Road, and for the benefit of the owners and occupiers thereof; that the defendants had acquired a right by prescription to drain into the said sewer; and that, although the sewers in the above-mentioned roads were vested in the defendants under the Public Health Act, 1875, that vesting gave them no right to stop up the connections with the Stroud Green Road sewer.—Judgment was given for the defendants with costs.

# Trade and Craft.

## COUSLAND AND MACKAY.

A well-printed catalogue which we have lately received is that sent by Messrs. Cousland and Mackay, of Glasgow. It is well arranged, and one of its new features is a sketch section showing the firm's method of applying their various ventilating specialities to a building. The goods mentioned in the catalogue are copiously illustrated, and each article has a number, so as to prevent any confusion in ordering. Great care has evidently been taken to make the work reliable and complete.

## A GOOD STONE-CUTTER.

Messrs. J. G. Faulds and Company, of 48, North Frederick Street, Glasgow, are the manufacturers of one of the best stone-cutters. The patent improved multiplex stone-cutter combines lightness with great efficiency in working, and perfect freedom from the annoyance of bad sharpening and tempering. Simplicity and economy are apparently two of its advantages. It is very simple of construction, the handles being made with a slot, into which the cutter is inserted, and the fixing or removing of the cutter is very easy, owing to the fact that there are no screws or joints.

## NICHOLLS AND CLARKE.

The latest catalogue issued by Messrs. Nicholls and Clarke of Shorditch, London, E. is a bulky volume. It can be said without fear of contradiction that the book is a complete catalogue of sanitary appliances. It also deals with general goods supplied by the firm. It is substantially bound in green cloth covers, contains over 400 pages measuring 12½in. by 10½in., and is printed on good paper. Some idea of the variety of the contents may be realised when it is mentioned that the index occupies just on sixteen pages. Having this fact in view we will content ourselves with mentioning one specially useful feature. This is the section devoted to the acts and bye-laws referring to builders, &c. It was a happy thought to include this feature in the work; being set in bold type, it cannot fail to be the means of saving much labour and valuable time. The catalogue is well illustrated, several hundreds of blocks having been used for this purpose.

## Property and Land Sales.

**LOCAL SALE OF PLOTS on MAY 31st.—ILFORD.**—Uphall Estate, First Portion.—Free conveyances; payment by instalments; roads made; tithe and land tax free.—The special attention of Plot Buyers, Builders, and Creators of Ground-rents is directed to the sale of this Land, which is ripe for immediate building. — **ONE HUNDRED and THIRTY-NINE PLOTS** of ripe **FREEHOLD BUILDING LAND**, having frontages to the following thoroughfares, viz., Ilford-lane (a road 50ft. wide, leading from Ilford Broadway to Barking), Wingate-road, Natal-road, and Uhhall-road. The plots vary in frontage from 16ft. to 37ft., and in depth from 90ft. to 125ft., and are ripe for the erection of small houses and shops, and the immediate creation of ground-rents.

**MESSRS. DOUGLAS YOUNG and CO.** will **SELL** the Above by **AUCTION** at the Angel Hotel, High-road, Ilford, on **WEDNESDAY, MAY 31st, 1899, at SEVEN o'clock** in the evening.

Particulars and conditions of sale may be obtained at the Mart, E.C.; of the Solicitor, J. HOWARD SMITH, Esq., 7, Finsbury-circus, E.C.; or of the AUCTIONEER, 51, Coleman-street, E.C., Clapham and Ilford.

**LAND SALE in a MARQUEE on the ESTATE on THURSDAY JUNE 8th.**

**CLAPHAM PARK.**—An unequalled opportunity for securing **FREEHOLD VILLA SITES**, so rarely to be obtained in this neighbourhood. About half a mile from Clapham-road Railway Station and the City Electric at Clapham Cross, and the Cable Tramway, Brixton-road; and close to the lovely Commons of Clapham and Tooting Bec. Free conveyances; payments by instalments.

**LINCOLN HOUSE ESTATE.**—**TWENTY-EIGHT** choice **FREEHOLD SITES** in Clarence-road and Poynders-road, each having a frontage of 60ft. and an average depth of 340ft., secluded from the road by a beautiful belt of shrubs and trees.

**SIXTY PLOTS of BUILDING LAND**, with frontages of 30ft.; depths varying from 125ft. to 165ft. Situate in Rodenhurst-road, a new thoroughfare, 50ft. wide, leading from Poynders-road to Elms-road and Clapham Common.

**MESSRS. DOUGLAS YOUNG and CO.** will **SELL** the above by **AUCTION** in a Marquee on the Estate, on **THURSDAY, JUNE 8th, 1899.**—Particulars and conditions of sale may be obtained of the Solicitors, Messrs. PHELPS, SEDGWICK, and BIDDLE, 22, Aldermanbury; Messrs. LINELATE and Co., 2, Bond-court, Walbrook, E.C.; JOHN ANNAN, EDWARD DEXTER, Joint Managers, United Realisation Co., 32, Old Jewry, E.C.; or of the AUCTIONEERS, 51, Coleman-street, E.C.; 213, Clapham-road, S.W.; and Ilford, E.

**FLEET STREET, CITY.**—By order of the Governors of St. Bartholomew's Hospital.—A fine commanding Building Site, occupying an area of about 2342 sq. ft. on the south side and newly widened part of this great main thoroughfare, within about 40 yards of Ludgate-circus, having frontages of about 55ft. 6in. to Fleet-street and 51ft. 5in. to St. Bride's-avenue in the rear (facing St. Bride's Church); remarkably well lighted back and front, and suitable for the erection of first-class shops and business premises—a bank, newspaper or publishing offices, or other important buildings adapted to the position.

**MESSRS. DEBENHAM, TEWSON, FARMER, and BRIDGEWATER** are instructed to **LET** by **AUCTION**, at the **MART**, on **TUESDAY, JUNE 13th, at TWO**, on a Building Lease, for a term of 80 years direct from the Freeholders, the very compact and valuable **SITE** of Nos. 90, 91, and 92, Fleet-street, and 2 and 3, St. Bride's-avenue, in the City of London.

Particulars, with plans, of Messrs. WILDE, MOORE, and WIGSTON, Solicitors, 21, College-hill, Cannon-street; of Messrs. E. P'ANSON and Son, Architects and Surveyors, 7A, Laurence Pountney-hill, E.C.; at the Clerk's Office, St. Bartholomew's Hospital; and of the AUCTIONEERS, 80, Chapside.

By order of the Corporation of the City of London.—Very valuable and important Building Site, Nos. 120, 121, 122, and 123, Fenchurch-street, and No. 8, Billiter-square, in the City of London.

**MESSRS. G. A. WILKINSON & SON** are instructed to **LET**, by **AUCTION**, at the **MART**, on **FRIDAY, MAY 26th, at TWO**, on a Building Lease of eighty years, direct from the Corporation of the City of London, the very valuable **BUILDING SITE**, comprising 120, 121, 122, and 123, Fenchurch-street, and 8, Billiter-square, a splendid position in one of the most important thoroughfares in the City of London and nearly opposite to Mincing-lane. It possesses a frontage to Fenchurch-street of about 41ft., extends in depth about 157ft., and covers the large area of about 8200ft. Suitable for a block of shops and offices.

Particulars, with plan and conditions of letting, may be had of the Comptroller and the City Surveyor, Guildhall; and of Messrs. G. A. WILKINSON and Son, Surveyors and Auctioneers, 7, Poultry, City.

**SEAFORD, SUSSEX** (between Eastbourne and Newhaven).—To Builders, Investors, and others desirous of obtaining exceedingly choice Building Sites, overlooking the sea and golf links, on most favourable and easy terms of payment, in one of the healthiest and most delightful towns on the South Coast.

**MAPLE and CO.** have received instructions to **SELL** by **AUCTION**, at the **BAY HOTEL**, Seaford, on **THURSDAY, MAY 25th, 1899**, at **TWO o'clock** precisely (and free railway tickets will be sent to all intending purchasers), the Second Portion of the Sutton Estates, comprising about 120 exceedingly desirable **PLOTS of FREEHOLD BUILDING LAND** fronting the Eastbourne and Southdown roads and

Sutton-avenue, commanding sea views, overlooking the Seaford Golf Links, and about five minutes from the railway station and esplanade. Terms of payment, 10 per cent. deposit; balance in nine half-yearly instalments with interest at 4 per cent. and free conveyance.

Particulars with plans, of the Auctioneers, 126, North-street, Brighton, London, and Eastbourne.

**ANSELL and MALLOWS, Architectural** Draughtsmen and Quantity Surveyors, 21, Buckingham-street, Strand, W.C.

**R. I. B. A. EXAMS. PREPARATION**, personally or by correspondence, in three, six, nine, or twelve months' courses. Architectural Lending Library. Special three months' finishing courses.—For full particulars apply to Messrs. HOWGATE and BOND, Associates R.I.B.A., Perchard House, 70, Gower-street, W.C. (close to the British Museum).

**ARCHITECTURAL Institute, Society of** Architects, and Civil Service Technical Examinations. Preparation by correspondence, personally, or in residence. Seventeen first places.—MIDDLETON and CARDEN, 19, Craven-st., W.C.

**MASON'S CHISEL, STEEL**,  $\frac{1}{2}$  to  $\frac{11}{8}$  octagon, 12s. to 16s. per cwt.; Chisels, 6d. lb.; Best Cast Steel for Lettering Tools, &c., from  $\frac{1}{2}$  in. to 4d. lb.—E. DEALEY, Moore-street, Sheffield.

**FOR SALE** old-established Builders' Merchant's Business, East London. Proprietor retiring. "A.E.," 91, London Wall, E.C.

**GENTLEMAN** holding valuable Sole Agency for Cement and Building Materials is desirous of meeting with someone in the trade to finance him. Liberal profit without risk.—Box 1063, BUILDERS' JOURNAL Office.

# ARCHITECTURE AND CRAFTS

## AT THE ROYAL ACADEMY.

The pre-eminent position occupied by THE ARCHITECTURAL REVIEW has enabled the proprietors to secure the right of reproduction of all the leading designs exhibited at the Royal Academy this year.

The designs will be published as SPECIAL SUPPLEMENTS to the ARCHITECTURAL REVIEW for May, June, July, and August, and the four numbers will form the most complete permanent record of current Architecture and Design.

*The MAY NUMBER (already issued) contains Illustrations of the Exhibits of*

A. WATERHOUSE, R.A.  
ASTON WEBB, A.R.A.  
E. W. MOUNTFORD.  
LEONARD STOKES.  
W. A. PITE.  
BREWILL AND BAILY.

C. HARRISON TOWNSEND.  
F. W. POMEROY.  
NELSON AND EDITH DAWSON.  
ALEXANDER FISHER.  
H. WILSON.  
And many others.

*The JUNE NUMBER (now in the Press) contains Illustrations of the Exhibits of*

R. F. ATKINSON.  
BATEMAN AND BATEMAN.  
F. W. BEDFORD.  
BEDFORD AND KITSON.  
JOHN BELCHER.  
R. A. BRIGGS.  
BUCKLAND AND BATEMAN.  
W. R. COLTON.  
ALFRED DRURY.  
E. ONSLOW FORD, R.A.  
GEORGE J. FRAMPTON, A.R.A.  
G. C. HORSLEY.

MALLOWS AND GROCOCK.  
MISS E. MERCER.  
ERNEST NEWTON.  
ARTHUR ORR.  
W. A. PITE.  
A. M. PRENTICE.  
E. F. REYNOLDS.  
W. H. SETH-SMITH.  
M. H. BAILLIE-SCOTT.  
LEONARD STOKES.  
A. WILLIAMS.  
And others.

The later numbers will be equally representative.

These Supplements are given in addition to the ordinary contents of THE ARCHITECTURAL REVIEW, which are varied and interesting.

## An Architectural Causerie.

### Board School Architecture.

THE school given in our illustration is only one out of over three hundred, erected, in considerable haste, from the designs of Mr. E. R. Robson, to overtake educational arrears since the passing of the Education Act of 1870. In their *motif* these are founded mainly on the types still to be seen in the flint and brick buildings of the Isle of Thanet, and those which still remained of the old brick buildings of London and its environs. Many of these schools have since been enlarged and altered beyond recognition. Although some twenty years old, Hanover Street School is typical of the leading principles which have influenced all school

designs by the same architect, involving very ample light, a studied sky-line, solid mass and absolute simplicity. Built in a neighbourhood at once squalid and picturesque, the limited nature of the site demanded a playground under the building, and our view of the side towards the canal gives a fair impression of its general character. Its architecture expresses its purpose, and fits its landscape and surroundings. In giving this example, it may be pointed out that the creation of a distinctive architectural style for schools of undenominational character, however successful in itself, has had an effect far beyond that of giving the schools the importance of public buildings, or of setting their mark on the whole of London, or of distinguishing the schools themselves from other buildings at a glance. The ordinary stock brick is the facing material, the window-jamb and main angles are brightened by a ruddier colour, and, lastly, the gables are treated with curved outlines in preference to straight. This last feature has set up a universal mania for fantastic gables, whether in brick or stone. Architects have struggled over it as never before. Not only old England, but Germany, Holland, and Belgium have been ransacked for examples. Whole streets at the West-end of

London have been influenced by the idea, and builders have combined their efforts with that of rendering terra-cotta useful as a building material. Throughout England the London school gables have been copied and travestied. Even the speculative builder has imported some suspicion of it into his rows of small houses, stretching for miles on every side of the metropolis. In spite of many happy results in the hands of men of knowledge and taste, it is lamentable that, in by far the larger number of instances, the manifest evidence of struggle, in inferior hands, has carried with it the condemnation, not merely of the particular design, but of the style itself. Knowledge has been too commonly wanting, ignorance of form too great, vulgarity all too prevalent, self-restraint too frequently lost. Hence, at no previous period have so many malformed and distorted gables been produced as in the last twenty-five years. It is not too much to say that the prevailing architectural note of the expiring century is that of what we must call, for want of a better word, the "cockorum" gable. As now usually followed by the builders of provincial Board schools, the style may be dismissed as having finally gone to seed. We may, therefore, welcome the evidence afforded by other works, produced by the

HANOVER STREET SCHOOLS, ISLINGTON, LONDON. E. R. ROBSON, ARCHITECT.

more cultivated among our younger architects, that they are turning for inspiration to the study of older and purer types, and that though Greek art may be out of reach, old Spain is serviceable as a foundation. On the general question, and apart from a preference for this or that style, it is important that each architect who may possess a spark of artistic fire, should produce his work so carefully, that, when done, it shall seem to have been done without effort. There can, in this sense, be no worse architecture—save always such as betrays downright ignorance—than that which reveals the designer as having strained his artistic faculties almost to breaking point. The work then not only fails to be either interesting or suggestive, but may be really repulsive, however clever. A man, working well within his powers, can produce better things by the simple exercise of greater care and pains, and by the serious purpose of setting himself to produce beautiful architecture within recognised lines than by any other. If we cannot have original architecture without ugliness, let us prefer the lesser evil. In an age of haste and hurry, let us never forget that no fine work of art was ever produced in a hurry. In point of school planning, the Hanover Street School is not now a model for imitation. Since its erection, the science of the subject has been carried further. Left-hand light is now required to the classes. Many improvements in organisation and teaching methods have been made. The principle of the Central Hall is more prevalent. Pupil-teachers are much fewer in proportion to certificated teachers. All these things have combined to work radical change in school plans. The lessons, however, as to main external treatment, remain. One of these is, never to place windows where they would be detrimental to the work inside for the sake of mistaken ideas of real symmetry. Another is, that simple outlines, well considered, are more likely to remain a source of pleasure than more grotesque forms applied to gables of buildings in conspicuous positions. They are also of the more serious character which befits the dignity of a public building.

E. R. R.

## OUR COMPETITION.

### EXTENSION OF TIME.

IN response to the request of several intending competitors who desire further time for the preparation of their designs for a Country House, we have decided to extend the time allowed for sending in designs to **Wednesday, June 7th**. Those who intend to compete, however, must intimate to us their intention to do so not later than **ten days before** the Competition closes. Full details as to the conditions of the competition, in which premiums amounting to **Thirty-four Guineas** are offered for the three best designs, appear on p. 200 of the BUILDERS' JOURNAL AND ARCHITECTURAL RECORD, dated May 10th.

## On Reflection.

Contractors and the L.C.C.

THE London County Council at their meeting last week sanctioned a procedure in reference to building contractors which is somewhat at variance with their recognised policy. Hitherto the Council have made it a rule either to throw open their work to public tender or to carry it out themselves by the direct employment of labour. But in regard to the blocks of dwellings now being erected on the Millbank site, the Council decided, on the recommendation of their Housing Committee, to accept the tender of Messrs. Holloway Bros. to build four additional blocks at the same rate as they had already contracted to build two blocks. There is, of course, a danger of injustice being done to other firms as well as additional expense being incurred if tenders are accepted in this way without the preliminary public competition, and several members of the Council opposed the recommendation on those grounds. But in this particular case we think the Council were fully justified in setting aside for the nonce their own salutary rule. Messrs. Holloway are prepared to carry out the work for a lower price than the Works Department of the Council would undertake it, and by the building of the six blocks being carried on simultaneously by the same builder, a great saving of time will be effected. This last is a most important consideration, for if ever there was a matter of urgency, it is this question of the erection of working-class dwellings. These houses cannot be erected fast enough to accommodate those who are in need of them. As Lord Onslow pointed out, the Housing Committee have now to consider not only the question of housing the destitute, but of finding houses for those able to pay a fair rent. We are glad to see that politicians and publicists of all kinds are beginning to recognise the extreme gravity and urgency of this housing question. Sir Henry Campbell-Bannerman, in a recent speech, said that he believed there was no public question of the present day which offered so formidable a problem as this of the housing of the people. The London County Council, in all their efforts, have only touched the fringe of the problem; and they will soon have to face the question whether they should not abandon their rule that all their housing undertakings should be carried out without involving a charge upon the rates, and proceed—in the interest of public health and public morality—to carry out a great scheme of rehousing at the public expense.

Overcrowded London.

If anyone wants to know what this housing problem really is, let him procure a small book, recently issued from the "Daily News" Office, entitled "No Room to Live," being a reprint of a series of articles that appeared in that journal from the pen of Mr. John Haw. Never before has the extent of the overcrowding evil in London been

brought home to us with such force and vividness. These chapters are a fine piece of journalism; but they are more than that. They are a clear summons to Members of Parliament, county councillors, guardians, district councillors, and in a secondary degree to all sorts and conditions of citizens to grapple with this tremendous problem. They supply the basis of facts which must precede any effective reform. Therein lies the great value of Mr. Haw's work. He offers a few hints as to the lines along which reform should proceed, but his great object has been to state the problem. Terribly grim and scarcely credible are many of the facts narrated; but we are assured that they are in no sense exaggerated. Surely never before in the history of the world has a great city made laws regulating its own health and allowed these to be violated by one-fifth of the population. The Public Health Act, 1891, decrees that in a room used both for living and sleeping each adult must have 400 cubic feet of space, two children under the age of twelve to count as one adult; yet in London no less than 900,000 people do not reach even that low standard of comfort, and consequently live in continuous contravention of the law. Surely never before have men in receipt of good wages, able and willing to pay high rents, utterly failed to find house room for themselves and their families, and eventually been compelled to send their wives and children to the workhouse, and themselves find a temporary shelter in a common lodging house. This is what has been happening in London lately. The consequences of this house famine,—the exorbitant rents, the disease, death, drunkenness, immorality, are clearly set forth, and not the less effectively because there is no fine writing or straining after effect. The problem will not soon be better stated; the next thing is to find the remedy. And here is a task worthy of the best energies of the wisest amongst us.

### Another Protest.

AFTER the weighty memorial of the architects, upon which we commented last week, the Dean and Chapter of St. Paul's have just received another, which they may possibly be inclined to regard as even more worthy of attention. It will convince them—if anything can—that the feelings of dissatisfaction aroused by Sir William Richmond's misapplied industry are not confined to architects and artists. The latest memorial includes names of men—some of the highest eminence—belonging to many professions and many parties. It is not an argument, as was the architects' memorial; the signatories confine themselves to one very definite appeal, viz., that the Dean and Chapter should, before proceeding further with the work, take the opinion of a strong representative body of experts as to the desirability of the character of the decorations. There is little doubt what the verdict of such a committee would be; it would be impossible, we think, to get a dozen signatures from men of any weight in the artistic world to a counter memorial in favour of the decorative scheme as it is now being carried out. We hope the Dean and Chapter will comply with this request and see to it that the proposed committee of experts is of so representative a character that all sections of the public may have confidence in its decisions.

Segovia

Cathedral from Alcazar

DRAWN BY F. HAMILTON JACKSON, R.B.A.

## SPAIN:

### Its Picturesque Cities and Monasteries.

#### VIII.—SEGOVIA.

By F. HAMILTON JACKSON, R.B.A.

(Continued from page 84, No. ccxiv.)

ONE may travel to Segovia from the north so as to arrive either at about 5.30 a.m. or 6 p.m. Like most of the Spanish towns, it is served by a railway on which but two trains run each way in the course of the twenty-four hours; these are found sufficient for the small though growing demands of the traffic. The night train is the favourite in the summer, because the heat of the day is insufferable, and for travellers whose time is limited it is convenient to be able sometimes to compress two days into one. We went from Burgos by the evening train to Medina del Campo, at which place we had to change, and kick our heels for two hours in the middle of the night. The train by which we went on was rather full, and the party became a good deal divided, the carriages being already occupied by silent Spaniards redolent of garlic. It was a greater pleasure than usual to see the dawn creep over the sky, and the features of the landscape become visible in that calm, quiet, grey light which seems to suit the landscape of Castile almost better than the brilliant sunshine, to which the traveller is more accustomed. The snow still lay on the Sierra de Guadarrama in large patches, making its beautiful purple blue more noticeable, and the various tributaries of the Douro which we crossed were real rivers and not torrents of stones, while the near foreground was green with springing crops, and became interesting with agricultural operations as the light became stronger and the peasants began to make their way afield.

The station at Segovia lies outside the town, and there is a fine, well graded road which leads to it with sweeping curves, planted with little trees. The conveyances which wait outside are truly wonderful things—something like old ramshackle omnibuses, long in the body, with much dilapidated paint, and with shutters to draw up in place of windows. They are drawn by teams of mules or horses, some of them three abreast, some harnessed one in front of the other, occasionally to the number of five; and when the luggage has been packed on the top of the vehicle with many groans and snorts (for the Spanish porter finds any parcel weighing much over 56lb exceedingly heavy

and calling for many expletives), and two men have climbed to the summit to hold it on, a start is made with much cracking of long whips and shouting and jingling of bells and of metal plaques attached to the harness in all sorts of unlikely places, and with a most imposing and picturesque effect.

At the top of the slope, where another road crosses and goes down to a public garden on the left, is a customs or octroi station, by the side of which is a shapeless mass of stone bearing an equal resemblance to a sea cow and a Lombardic lion or griffin. This is one of the Toros de Guisando, so called from several to be seen at a place of that name between Madrid and Avila. In 1598 Gil de Avila enumerated sixty-three of them in the central regions of Spain; in 1820 Somorrostro numbered only thirty-seven, so many had been destroyed. They are very ancient, but who it was who first set them up is unknown; they have been ascribed to Phoenicians and Carthaginians, and have been supposed to be idols of the aborigines. There were two in Segovia called El Marrano de Piedra and La Marrana, the sow—the word “Marrano” signified “excommunicated” in the eighth century (perhaps from Maranatha, accursed), and as it was used against the Jews, who were called “pigs,” it at last became synonymous with that word.

Beyond this point the road gradually descends, broad and well metalled, and lined with quaint houses, sometimes on the level, sometimes standing on a sort of terrace, or with the upper story resting on pillars, and with many great doors studded with nails and metal plaques, like those at Toledo, and coloured the most delightful reds and greens, or grey from the weathering of the unpainted wood. After a time the road narrows and rises, and again descends a little hill, and shops begin to appear, indicating that the centre of the town is near, while to the right, down a side street, one catches a glimpse of one of the glories of Segovia, the Roman aqueduct.

This aqueduct is called by the people “El Puente del Diavolo,” for all wonderful things in Spain are supposed to have been wrought by occult means, and who built it is uncertain, as neither Segovia nor its aqueduct are mentioned by the ancients; but judging from the resemblance of the masonry to that of Mérida and Alcantara it was probably erected by Trajan. It brings the water of the Rio Frio from the Sierra Fonfria, about nine miles away, and becomes visible opposite the ex-convent of San Gabriel, from which point to its disappearance on the other side of the valley there are no less than 320 arches, the central group of which is 102ft. high. It is constructed of granite without any mortar, and is a most imposing monument. In 1071 the Moors of Toledo sacked Segovia and destroyed thirty-

five arches of the aqueduct, and it remained in ruins until 1483, when Isabella employed a monk of the convent of El Parral named Juan Escovedo to repair it, giving him as his fee the woodwork of the scaffolding employed. He copied the old work so well that it is extremely difficult to tell which is newer and which older now that 400 years have passed.

The main road to Madrid passes under the central arches, and there is a little plaza on the inside, made by clearing away a number of small houses from the foot of the arches, upon the piers of which the stains of smoke still show. On one side of the plaza is a fountain. A market is held here in the morning, when much confusion prevails and many quaintly-garbed countrymen may be seen.

The principal road to the cathedral turns to the left at right angles to the direction of the aqueduct. On the wall may be seen one of those notices so common in Spanish towns in which the streets are narrow, which are intended to prevent wheeled vehicles meeting each other where it is impossible for them to pass—a little slab of marble with a horse and cart incised upon it, and the word “Salida” or “Entrada,” and an arrow pointing in the direction indicated by the words, which mean “exit” and “entrance,” so that the driver who cannot read can understand that he must not go up a “Salida” street, the direction of the arrow and the horse and cart making it plain to him. Not very far up this street is, on the right, a curious example of Spanish Architecture, based upon Florentine work apparently; a palace very solidly built, with the face of each stone cut to a prismatic projection, and with a round-headed door with enormously deep voussairs. The windows are protected by some good iron grilles. Facing this house is a breast high wall overlooking a flight of steps, from which a good view of the city in the direction of San Millan may be had, with the plain stretching beyond to the Guadarrama mountains—blue in the distance, and snow-capped in the spring, a very fine view.

Down a little court to the left is a house covered with a pattern impressed upon a coating of plaster, the design of which shows Moorish influence, and then the church of St. Martin appears on the right, a noble building with an open arcade built cloister-fashion round the south aisle and returned across the west end. Owing to the slope of the ground upon which the church is built this arcade stands on a wall elevated well above the road, and is gained by steps from the plaza with a fountain, into which the street expands at its eastern end. The tower is a very fine twelfth century work, and the carving of the capitals in the arcade is worth observing, but the inside of the church has

CITY BOUNDARY, SEGOVIA.

been modernised. It contains the tombs of Herrera, the architect, and his wife, and of Don Rodrigo, and the west doorway and door are very interesting. Just at this part of the street may be seen many wrought iron knockers, of fine design, and Moorish feeling; but Segovia is full of good ironwork.

Nearer to the cathedral is a little courtyard to the left containing an interesting old well with iron cresting and winding apparatus. This courtyard is picturesque with little Renaissance pillars somewhat like a Roman atrium, and is overlooked by a plastered wall with Moorish pattern upon it. This is the outer wall of the convent to which the church of Corpus Christi, which is just higher in the street, belongs. This church was built for a synagogue and much resembles Santa Maria la Blanca at Toledo, though it is less ornate. It has the same sort of capitals to the columns, arches of the same shape, and the same sort of arcade just below the roof, which also is very similar. At the bottom of the church are gratings through which the nuns may see what passes at the altar without themselves being seen. The east end of this church has been remodelled in the seventeenth or eighteenth century, like so many others in Spain alas! at a time when art feeling had sunk almost to its present low level.

We are now quite near the central plaza, the "Plaza de la Constitucion," which in Ford's time might be described in the words which he uses, "a Prout-like plaza," as is evidenced by the few houses which the march of modern improvement has left. On three sides a round arched granite arcading has been erected, and on two of these sides the houses have been completed on the model of

the modern dwellings one sees in provincial towns of France and in Italy. On the third side, that facing the cathedral, the ruin was not completed before funds gave out, one may suppose, for the old houses still stand forlorn behind the granite arcade, which is all that has been built.

From this plaza may be had a fine view of the eastern end of the cathedral, a mass of yellowish stone, the choir rising above and from among the chapels which cluster around its base, beyond which the transept and a part of the nave are seen. It is difficult to get a general view of the west front, the great height of the tower and the width of the façade, which incloses also the cloisters, requiring a greater distance to embrace in one view than the parvis in front affords. About half-way up the tower, which is still 330ft. high though it has been lowered 22ft., is a window from which projects a sort of crane with a bucket dangling from it. Within this is the abode of the Sacristan, who draws up his provisions &c. by means of this bucket like a bullfinch in a cage, and so lives between heaven and earth when the cathedral is closed. The tower may be ascended for the sake of the view, which is most extensive, the cathedral being perched on the edge of the rock beneath which through a sort of rocky gorge the rivulet Clamores flows to join the Eresma, the river upon which Segovia stands; and the daring who are careless of their lives and possess extra strong heads may go higher than the bellchamber, and by means of iron cramps fixed in the stone forming the roof of the tower may reach the very summit, a giddy height indeed!

The interior of the cathedral is very finely proportioned and most impressive, reminding one of Toledo, though later in style. Like that cathedral it has a central nave, flanked by two aisles on each side, and like it too it still possesses a quantity of fine Flemish glass.

The yellowish tone of the stone used in building it gives great warmth to the interior, and is well suited to give effect to the late Gothic panellings which enrich the walls and vaults, also making the shadows in the side chapels deep and mysterious. It was built by the architects of the cathedral of Salamanca—Juan Gil de Ontañon and his son Rodrigo—and is the last flower of Gothic ecclesiastical architecture in Spain, having been commenced in 1525, to replace that destroyed by the Comuneros in 1520. It is 351ft. long and 177ft. wide, the nave is lofty, rising to the height of 99ft., and appears higher than it really is, owing to the height from which the arches spring. In one of the chapels to the left is a pieta, by Juan de Juni, executed in 1571, which has received much praise; it is carved

and painted and the figures are larger than life. There is a great retablo of coloured marbles, which are also used in the Capilla mayor and in the trascoro.

When this was put up (for Charles III.) the ancient sepulchral slabs were carted out and lumbered up near the entrance—among them was that belonging to the tomb of Rodrigo Gil, the architect, who died in 1577.

The most beautiful thing connected with the cathedral, as at Tarragona, is the cloister. This formed part of the old building, and was taken down, repaired and rebuilt when the new one arose from its ruins.

In the centre is a beautiful garden, rather dishevelled perhaps, but none the less beautiful for that, with a picturesque well, and cypresses, lemons and other trees around it with a tangle of low growing flowering plants below. Over the entrance doorway grows a bushy jessamine, and behind the plants from every view is the warm coloured stone, worked into lacelike traceries of most beautiful design and crowned by a parapet with pinnacles rising from it at intervals, which also is pierced with an elaborate pattern. The light falls into the

RENAISSANCE DOORWAY, SEGOVIA.

cloister walk at a high angle, for the wall beneath the windows is more than the height of a man, and this gives this cloister quite a different effect from most. At the end of one of the walks is a little chapel shut off by a reja of beautiful design. Many of these less pretentious works in iron are really more charming, perhaps because more simple in design, than the masterpieces of the great smiths which excite the wonder and admiration of the instructed beholder, on account of the great difficulties so successfully overcome. (To be continued.)

TWELFTH CENTURY CHURCH, SEGOVIA.

**An Old Well was Discovered** by Mr E. P. Wynne, chemist, of Aberystwith, while excavating in his cellar last week. Two others have also been discovered, but none of them contained much water.

**A Memorial of a Battle.**—The Emperor of Germany intends to lay out a plot of ground at Berlin as a memorial of the Battle of St. Privat. The central figure will be a colossal mailed angel, the designs for which His Majesty himself has prepared. The sculptor is to be Mr. Walter Schott Ford.

**New City Fire Station.**—The Fire Brigade Committee of the London County Council brought up a report, at a meeting of the Council last week, recommending the purchase, for £31,500, of a site in Red-cross Street, E.C., on which to erect a new fire station, to be used in substitution for the existing White-cross Street station. The cost of building the new station will probably be not less than £15,000.

## ROUND TOWERS OF IRELAND.\*

By ANTHONY SCOTT.

*(Continued from page 218, No. ccxviii.)*

MR. GLADSTONE'S Government in 1869 added a clause to the Church Dis-establishment Bill, setting aside a small sum of Church surplus fund to be applied in preserving Irish National Monuments of architectural and historical interest, and about twenty-five monuments were scheduled in connection with this Act. Sir Thomas H. Deane (then Mr. Deane, R.H.A., Architect), was appointed by the Treasury Superintendent of the National Monuments, in conjunction with the Commissioners of Public Works in Ireland, who had control of the funds. Several other monuments have in subsequent years been added to the original list, embracing nearly all the ancient buildings

in the country worth preserving, including the principal round towers. It has been to me one of the most pleasing duties of my life to superintend for a period of twelve years the restoration of these ancient towers and temples of past ages—to trace in the ecclesiastical ruins the rise, development, and transition from the primitive, tiny quadrangular church with its western doorway, having inclined or sloping jambs, to the beautiful groups of Romanesque monastic buildings of more modern times. This was a pleasing study so far as marking the rise, progress, and development of early Christian architecture was concerned, in the same way as we follow Ferguson and other writers of architectural history, who commence with man's primitive efforts to build in stone.

**Stone-build Churches.**

So far as stone-built churches are concerned, there has been no controversy, for all are agreed as to their being the work of the early Christians, but it is not, nor has it been, so with the circumjacent towers, around which so much doubt and uncertainty hangs. It

was these buildings which attracted my attention most in consequence of this uncertainty and doubt. If they were the work of a period much earlier than Christianity, I felt sure they would bear the impress of some distinctive features not to be found in the work of more modern times. I provided myself with Dr. Petrie's exhaustive inquiry into the origin and uses of the Round Towers, Canon Smiddy's, O'Brien's, and Keane's works also on the subject, and in this way I commenced a study of these curious buildings which appear to have puzzled generations of Irish historians and archaeologists, as well as writers and historians of other countries. I may be pardoned, if, after years of close contact with these buildings, I have formed, and now give expression to, very decided opinions as to the period of their erection.

**Reputed Origin of the Round Towers.**

As regards the word "origin," I fear it is and has been a very misleading expression. I would, therefore, rather confine myself to what I consider the period or periods of the

Puerta de  
Sant Andres  
Segovia

DRAWN BY F. HAMILTON JACKSON, R.B.A.

probable erection of the Towers; but, whatever may have been the period at which the first Round Tower was erected in Ireland, there can hardly be a doubt but that they are a type of a structure or structures still older or evolved from some particular idea, so that the word "origin," pure and simple, may possibly date back to the remote ages of prehistoric antiquity. Places appropriated to religious worship are of very early origin. In the Sacred Writings we have evidence of their existence from the remotest periods. Their prototypes are implied in the history of the antediluvian patriarchs, in the altar erected by Noah, in the pillar set up by Jacob which he called "God's House," in the sacrifices of the first diluvian age, as well as in the circles of stone set up by Moses at the foot of Mount Sinai, and by Joshua at Gilgal. They are found in the early temples of Egypt and in

ROUND TOWER AT ARDMORE, CO. WATERFORD.  
DRAWN BY ANTHONY SCOTT.

the gorgeous Tabernacle, raised by Divine command, in which the children of Israel worshipped. The

#### Earthen Rathes and Stone Circles

of Ireland appear to be the first mechanical constructions known to Irish history. Within these circular rathes and stone circles were smaller circular buildings in the shape of caves and what have been termed "beehive cells," hidden beneath the mechanically formed mounds of earth, clay and stones. The outer circles and entrenchments or fosse were the ramparts or the defences. Structures of this kind are to be found all over the country, notably in New Grange, Dowth, and Knowth, in Co. Meath, near Drogheda. They are said to be sepulchral erections, possibly primitive dwellings or inclosures of the Pagan Irish. We go on from these to the dry stone cashels on the South-west coast of Ireland, as at Gallerus in Co. Kerry, and Islands in the Atlantic off the same coast, and in various other parts of the country in mountainous districts. We find the circular cells built of dry stones laid in horizontal

courses sloping inwards towards the top in the shape of a beehive, and covered on top with a single stone.

#### The Cashels

appear to be the earliest stone buildings of Christian times, and they consisted of a number of circular detached beehive cells, in most instances protected by a circular dry stone wall, as at Dun Angus on the Island of Arran, in Galway bay, at Gallerus, in Co. Kerry, and on the Skellig rock in the Atlantic off the same coasts. In the case of the cashel at Gallerus the spaces between the different cells have been filled in with dry stones, and covered passages connect the different cells with the exterior face of the wall which bounds the group of cells, and which appears to have originally stood about 6ft. high. We pass on from these groups of beehive cells to the larger single round or detached circular houses, some of which are still to be found on the South and West coast, for instance in the island of Lough Lee, in Kerry, and Ardilaune, off the coast of Connemara, and elsewhere. There can hardly be a doubt that these circular monastic cells and inclosures were a development of the raths, and earlier cells found in the raths constructed by the Pagans of earlier days. These groups of monastic buildings must also have produced the single isolated round houses or churches already referred to. Now if we examine carefully the remains of all mechanical constructions found in the country in the shape of defences and inclosures, whether of earth or stone, as well as all domestic and sepulchral caves, whether of the early Christians or of their Pagan ancestors, we shall find them all

#### Circular in Plan,

and when we come to Christian times we shall find them all developments of and improvements on the circular beehive cell. It is admitted, and as a matter of fact must be admitted by all who have taken any interest in the subject, that more than half the number of towers which at one time dotted the land have perished. The Round Tower of Annaghdown, co. Galway, built, according to the "Annals of the Four Masters," in 1238, has wholly disappeared, and even tradition cannot point out the site which it once occupied. The first towers built may have been but very insignificant structures, and in confirmation of this I may state that some of those which remain would be no very extraordinary development of the circular stone cells and churches of the early Irish Christians. I consider that there is no need to go to the St. Simon Stylites Towers in India or Persia or to search in eastern or continental countries for prototypes. I have not the slightest doubt as to the original towers having been simple developments of the circular buildings which obtained at the time.

#### A Curious Theory.

Canon Smiddy published in 1873 a book entitled "The Druids' Ancient Churches and Round Towers of Ireland," in which he puts forward a most peculiar theory respecting the origin and uses of the towers. He says the towers are reed houses—that the idea has come from a reed which grows in marshy ground, and terminating with a conical head is the prototype of the Round Towers, and the use to which he assigns them is that of baptisteries. He bases his argument on the pronunciation of the Celtic word *cloic treach* (*cloic* a bell, and *treach* a house), which he says is confounded with and taken for the *caille* a reed, *each* a house—reed house. In support of this theory he wanders off to Florence, Pisa, and other Continental cities which have had baptisteries attached to the episcopal churches, and tries to establish a similarity of construction and uses between the baptisteries referred to and the Round Towers of Ireland, where none whatever exist. So wild and absurd are the theories put forward that it would be waste of time to follow his arguments for the purpose of showing how groundless they are from start to finish.

#### Supposed Pagan Origin.

The late Very Rev. Canon Ulrick J. Bourke, Professor of Languages, St. Yarlath's College,

Tuam, published a work in 1875, entitled, "The Aryan Origin of the Gaelic Race and Language," in which he devotes the greater portion of two chapters to the subject of the Round Towers. He holds that the Round Towers were built in the early Pagan period by those of the Aryan race who had settled in this Island of Destiny, but that, after the Gospel had been preached in Ireland by St. Patrick, he turned the Round Towers, as he did the Pagan foundations, to the service of Christian rites, and hallowed them by Christian practices and religious associations. This fourth opinion, as he calls it, is that which seems to His Grace, The Most Rev. Dr. MacHale, the most convincing and the best supported by reason and authority (p. 352). His Grace of Tuam was an eminent Churchman, and a guiding star in the domain of Irish politics in his day, but I have never heard or known that he took any interest in Irish antiquarian research, and hence it appears to me that Canon Bourke very easily impressed Dr. MacHale with his plausible theory of the Pagan origin of the Round Towers. Besides, His Grace was fast approaching the end of his long, eventful life at the time the work was published. Canon Bourke brushes Dr. Petrie aside to make room for his own Aryan or Pagan origin idea, and tries to prove from the highly artistic work of early Christian times—for instance, the illumination of the Book of Kells, and other artistically illuminated MSS., as well as highly artistic metal works, &c.—that the Pagan Irish, the progenitors of the early Christians, were all so far advanced in arts and sciences.

#### Unwarranted Statements.

No person who has read Dr. Bourke's book will deny that he was a philologist of distinguished merit, but that is not sufficient proof that he was very well qualified to deal with the subject of the Round Towers, which the following quotations from his work will more fully explain. Canon Bourke confined the practical part of his examination to an inspection of the remains of the Round Towers at Kilbannon, near Tuam, Roscane, near Galway, and possibly one or two others in the immediate vicinity of his home. The towers alluded to are but poor specimens of the Round Towers of Ireland. He goes on to state at page 376, "It appears to the writer that the stones of all the Round Towers have been taken from some two or three quarries, just as in Egypt the stones which went to the erection of the pyramids had been all dug from the same quarries in the Lybian Mountains west of the Nile." This is the most reckless statement which could possibly be made by any writer in face of the fact that in every single instance the towers are constructed with materials—stones—found in the immediate neighbourhood of these structures.

#### Building Materials Used.

In Glendalough, Co. Wicklow, the stones used for general walling are the greenish mica slate (which is the general formation of the local hills and mountains), mixed with granite boulders, which are to be found scattered over the adjoining hills and valleys, carried there by icebergs during the glacier period. In Ardmore, in the Co. Waterford, and Clonmacnoise on the Shannon, the Round Towers are wholly composed of sandstone; in Kilmacduagh, in the Co. Galway, the tower is built with local blue limestone; in Devenish, in Co. Fermanagh, the exterior of the tower is composed of sandstone grit, found in boulders along the lake shore. The interior is lined with limestone, which does not stand the weather so well. And so in every district in Ireland the same thing occurs. The towers are in every case constructed with stones similar to those which are to be had in the immediate neighbourhood of these structures. In the neighbourhood of Kilmacduagh, in the Co. Galway, there are hundreds of acres of blue limestone, naked rock, firm and compact, forming an excellent building stone, wholly uncovered by any earth, furrowed and honey-combed by the action of the weather. Similar honey-combed stones are plainly visible in the interior for the tower foundations. Continuing, he says, "the Pillar Towers of

Ireland are a standing proof of the perfect knowledge in the art of building possessed by the people who at first planned and erected those defiant 'conquerors of time.' Like the book of Kells, they are even to the present hour abiding proofs of the consummate art which left to posterity such enduring monuments in architecture as well as in the art of dyeing and painting. The ancients had regard to

ROUND TOWER AT DEVENISH, CO. FERMANAGH.  
DRAWN BY ANTHONY SCOTT.

durability, and in this aim they have certainly surpassed all modern schools of science and art. Nothing at the present day can be executed with pencil or chisel that would, like them and the pyramids of the ancient world, stand the 'test of time.' This is a fallacy which I must strongly contradict, so far as building construction and building materials are concerned. The towers are not at all imperishable, and when I come to consider the question of construction, I shall deal more fully with this point.

Before Dr. Petrie's time the prevailing

general opinion was that the towers were of Phœnician or Pagan origin, Buddhist temples, fire temples, places of sepulture, &c. Many held that they were of Danish origin, or rather built by the Danes. As regards the Danish origin, it will be admitted that the Danes were never fully established in Ireland, and for the intermittent periods during which they occupied the country, their greater strongholds were Wexford, Waterford, and Limerick. If they were the builders of the towers, it might be naturally expected that in the districts in which they had the strongest foothold most of the towers would be found to exist, whereas the contrary is the case, for there are but very few pillar towers in the counties in which they had their most permanent settlements. If these northmen from Denmark and Scandinavia had built these towers in Ireland, why did they not erect round towers in Normandy, Belgium, Denmark, Jutland, and Scandinavia? It is quite clear that the Danes never had anything to do with the Irish Round Towers, for if they had, structures of a similar or somewhat similar character would be found in other countries invaded by them, but no monuments of the kind are to be found in the countries named. It is therefore manifest that the Danes never built these towers.

We have it on reliable authority of French historians that round towers were built in certain districts of that country in connection with churches, for the protection of church furniture, and in districts only which were subject to the periodical incursions of the heathen northmen. It is quite evident that the building of the towers of Ireland became a necessity during the centuries in which the country was subject to the invasion of these northern hords. Mr. Marcus Kane, M.R.I.A., in a work published by him in 1867, entitled "The Towers and Temples of Ancient Ireland," states that there have been 120 Round Towers in Ireland, and that the remains of sixty can be traced. Mr. Kane has evidently made a close study of the towers, and states that he travelled more than 5,000 miles through Ireland, chiefly on post car, to inspect, measure, and to sketch the then existing remains. His drawings and illustrations are no doubt accurate and well got up, but I fear he has but a poor following as regards his extraordinary theory as to the period and people by whom the towers have been erected. Mr. Kane proposes to show that the Round Towers were built by the Cuthites, as he calls the immediate descendants of Ham or Cham and the progenitors, according to him, of the Scythian race. It would be perfect waste of time to follow Mr. Kane's wild theories, and trace them back step by step to the remote cradle of the Scythian race. As a matter of fact the difference between one theorist and another of the Pagan origin champion writers differs only in detail in ascribing the construction of the Round Towers of Ireland to one branch or other of the human race which had its origin in Asia, and spread itself over the continent of Europe at one period or another. The earliest reference to these bell houses, found in the Irish annals and appended to Lord Dunraven's "Notes on Irish Architecture," occurs in the year 950, and merely refers to the Tower of Slane, as existing at that day, but how long it existed before that date is uncertain. It may be here mentioned that no trace of this tower exists at present, while considerable portions of the monastic buildings and a later Abbey Church with square tower at western end remain standing.

I have always maintained that if we had architects and artisans in pre-Christian times capable of constructing such beautiful cylindrical shafts, progressing from coarse spawled rubble, as at Drumcliffe and several other primitive towers, to coarse hewn ashlar with carved and moulded work, as at Devenish, Ardmore, Kildare, and Timahoe, surely they would not confine their skill to the towers alone; they would in all human probability have left us other traces of their skill and workmanship. But what is the fact? Besides the round towers alone not a single champion of the Pagan origin theory has ever attempted

to point out another single fragment of solid rubble or other masonry work in the whole country which they could say dated from the pre-Christian times.

We have numerous remains of ecclesiastical architecture resembling in every detail the workmanship and material used in the towers, both standing side by side, and presenting the same weather-worn appearance. In many

SECTION OF ROUND TOWER AT DEVENISH, CO. FERMANAGH. DRAWN BY ANTHONY SCOTT.

instances the tower would appear to present later and better-preserved workmanship, as shown by the unerring eye of the camera.

(To be concluded.)

**A powerful Organ** has been placed in St. Bees Priory Church; it has cost £1,400.

**Thirty-two Foundation-stones** were laid at the new Primitive Methodist Schools at Swinton recently by thirty-two scholars. Even this number seems to have been insufficient, as several other stones were laid by local ladies and gentlemen.

**To Develop Walney Island**, Barrow-in-Furness, a new company has been registered, called the Isle of Walney Estates Company, Limited, with a capital of £100,000, all of which has been subscribed to develop the island into a seaside resort.

## THE VICTORIA AND ALBERT MUSEUM.

THE project of extending and completing the South Kensington Museum is not one of yesterday or the day before. It has for many years been recognised by everyone who has given a moment's thought to the matter that the existing buildings at South Kensington are grotesquely inadequate for the preservation and display of the priceless treasures they contain.

As long ago as 1891 the Government of the day inaugurated a limited competition for the completion of the buildings, and Mr. Aston Webb's design was the one accepted. The plans were exhibited to the public in the South Kensington Museum, and many no doubt supposed that the work, already too long delayed, would be put in hand at once. For one reason and another, however, the matter was left in abeyance, and the nation went on buying art treasures for which it had no proper accommodation, and generally allowing affairs at South Kensington to remain in the chaotic condition they had been in for years.

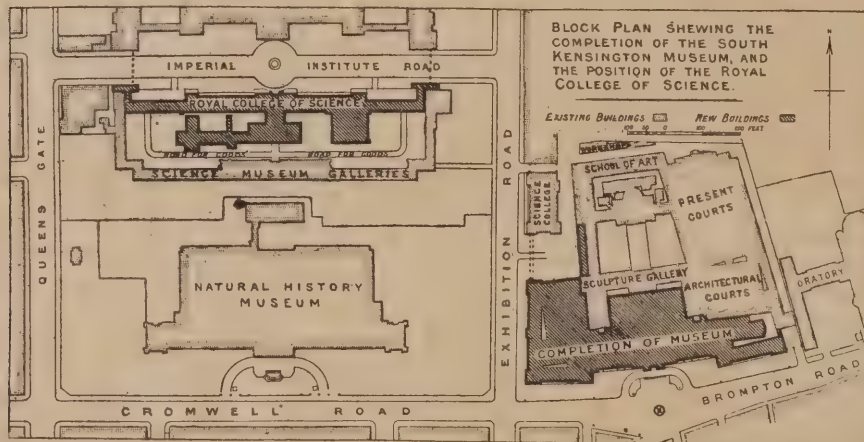

At intervals the Government was plied with questions as to when the work was to be begun, but there was always a reason—or an excuse—for doing nothing. When the year of the Queen's Diamond Jubilee came round there were those who thought that one admir-

able way of celebrating the occasion would be by carrying to completion the scheme in which Her Majesty and the Prince Consort had been deeply interested. This view was put forward in the House of Commons, and some of the members got commendably angry at being again met with a refusal to proceed with the work. The excuse this time was that a Select Committee was engaged in inquiring into the administration of the Museums of the Science and Art Department, and that it would be unwise to do anything till the committee had reported.

It is evident that the new museum has been designed to group with the other important buildings that are its immediate neighbours, so that one shall not dwarf or contrast unpleasantly with another. The block plan on this page clearly shows the relative disposition of the proposed and the existing buildings, and the manner in which Mr. Webb's additions to the museum will combine with the existing galleries.

It may be doubted whether in any other capital in Europe such an example of dilatoriness in respect to urgently needed public improvements could be found. We in this country are notoriously averse from spending money on architecture; the erection of a new public building is always considered to be a matter that may be delayed indefinitely. However, we may congratulate ourselves that at last the long delay is ended. The foundation stone of the new building was laid by the Queen last Wednesday, and we may hope that at last Mr. Aston Webb's noble building, of which a perspective view and the south elevation are given in one of our inset plates, will be completed with reasonable expedition.

The design has been considerably modified since it was first accepted. The central block of the façade has been widened, and the tower which stood there in the original design has been diminished in height, and converted into a pavilion rather than a tower. Generally speaking the modifications have been in the direction of giving the building a more strongly Renaissance character. The frontage of the new museum will be some 700ft. in the Cromwell Road and 300ft. in the Exhibition Road. The whole

of the frontages will be occupied by four floors or galleries. The remainder of the space will be covered by eight top-lighted courts, somewhat similar to those in the existing buildings, opening out of each other, and giving a continuous vista of over 600ft. The main pavilions will be marked at the angles with cupolas, and the great central entrance by an open lantern some 150ft. high. Light will be obtained by long rows of square-headed windows, kept well up to the ceiling, those on the first floor being divided by niches and statues representative of the treasures contained in the museum. The cupolas will blend with the pointed roofs of the Natural History Museum. A space will be reserved, in the centre, opposite the entrance, for a sculptured representation of the Queen and the late Prince Consort.

It will be seen that the erection of the Victoria and Albert Museum and of the Royal College of Science (another of Mr. Webb's works, for illustrations of which see the BUILDERS' JOURNAL and ARCHITECTURAL RECORD for April 12th) will complete a splendid group of public buildings, symmetrically arranged and forming a combination unique in London and not easily to be matched in any city in the world.

## Keystones.

**A new Congregational Chapel at Hollybush** is to be erected at a cost of £380. Mr. W. S. Williams, of Tredegar, is the architect, and Mr. W. Morgan is the builder.

**A large Block of Warehouses** is to be erected in Clifton Street, Finsbury, London, E.C. at a cost of between £21,000 and £26,000. The premises are to be built from designs by Mr. E. Willey, architect, of 33, New Bridge Street, London, E.C.

**Stained-glass Charter Memorial.**—It was decided at a public meeting at Kingston-on-Thames to place a stained-glass window in the Town Hall as a permanent memorial of the seven hundredth anniversary of the granting of King John's Charter to the borough.

**A Livingstone Monument.**—Mr. H. M. Stanley, M.P., has issued a circular asking for subscriptions for the purpose of raising a permanent memorial to the memory of Dr. Livingstone on the spot where the great missionary died. He proposes to raise £5,000 for a large monument in bronze.

**A Northern Approach to the Tower Bridge.**—At last week's meeting of the London County Council it was agreed to contribute £7,000 towards the cost of purchasing 60 to 78, Mansell Street, for the purpose of widening that thoroughfare so as to form a northern approach to the Tower Bridge.

**Proposed Library at Weston-super-Mare.**—The Urban District Council have applied to the Local Government Board for sanction to borrow £2,500, to complete the amount required for the erection of a free library and museum. An inquiry into the application was held last week, at which it was explained that the total cost of the building would be £6,000.

**Discovery of Thirteenth Century Remains.**—The excavations for the chapel wing of the Archi-episcopal Palace at Canterbury, now in course of erection, have revealed some thirteenth century remains of the monastic buildings, including portions of a elaborately arched chamber. The palace is being constructed to the westward of the cathedral, and is of Early English design.

**Hospital Extension at Wallasey.**—The Joint Health and Works Committee of the Wallasey District Council have adopted a scheme for the extension of the infectious disease hospital, and have resolved to apply to the Local Government Board for power to borrow £9,030. They propose to purchase 12,875 square yards of land in Mill Lane, Liscard, for £2,630, which includes contingencies, also to provide a works dépôt, which will cost £6,400.

**Smoke Nuisance at Halifax.**—Messrs Fletcher Bros., dyers, of Raglan Street, were summoned before the Halifax Borough Court last week, at the instance of the Corporation, for allowing dense black smoke to be emitted from the chimney at their dyeworks. Mr. Clarkson, for the defence, stated that within the last two years the firm had expended £1,000 in their endeavours to obviate all cause for complaint, and they were now incurring an additional expenditure of £500 a year in purchasing coal of a superior quality. The Bench made an order for the abatement of the nuisance within one month.

**A New Bridge and New Sewers wanted at Keighley.**—A Local Government Board inquiry was held at Keighley last week to hear the application by the Corporation for power to borrow about £17,000 for public works. The Corporation sought £8,260 for a proposed bridge in Queen's Road improvements in Oakworth Road and North Street, and the paving of Bradford Road with granite. They also asked for £4,558 to construct about twenty sewers of various lengths in Moss Carr, Dalton Lane, Skipton Road, &c., and for £4,500 for land in Lawholme Lane adjoining the Midland Railway, purchased from Messrs. W. Summerscales and Sons, Limited. No objection was raised to the application.

## REGISTRATION OF ARCHITECTS.

*the Editor of THE BUILDERS' JOURNAL.*  
 OGHEDA.

DEAR SIR,—In your issues of the 3rd and 10th inst. you have very kindly given space to two most excellent letters on the above subject. In my mind you are entitled to the thanks not only of your correspondents but also of the whole architectural profession for opening the columns of your valuable and progressive journal for the discussion of the subject. In serving your own opinions for the present on the question of registration you have acted wisely.

Whether the benefits or advantages to be derived from registration be much or little I do not see in what way it can be injurious. I have never heard one solid argument put forward against registration. One of the strongest arguments I have ever heard advanced against it was that in the first instance registration would include a large number of incompetent practitioners and place them on an equality with the best men in the kingdom. I grant that a considerable number of undesirable men would have to be included, but I contend that no human law could possibly place such men on an equality with the leaders of the profession. The distinction would be as great then as it is now, and as it will be in all professions, whether registered or unregistered.

Registration never contemplated including within the ranks of the profession any men who were not wholly engaged in the profession of architecture. It surely never contemplated including such men as your correspondent "architect" refers to. Even if a considerable number of men having but a poor claim on the profession had to be admitted in the first instance (and such a contingency could not possibly be avoided in any scheme of the kind), they would in the natural course of events die out, and then the profession would have a clear future before it.

I can well believe "Architect's" statement when he says that a plumbing job had been tried out on his specification. The writer would quote several instances of the kind, and give names and particulars. I have a local newspaper in my possession, not two weeks old yet, which reports the proceedings of an annual district council, who directed their list of works—an unsuccessful builder—to prepare plans for two houses, although an architect, I.B.A. has his office in the next street, and is well known to the council as a first-class architect.

So far the opposition of the Council of the I.B.A. has been a mystery to me. I can well understand that the members of the Council are far beyond and above the reach of the ordinary man—incompetent architect. This Council could not possibly take a commission from one of these distinguished gentlemen in a hundred years. But it should be borne in mind that the Institute has branches all over the kingdom, and that the members of these branches or affiliated societies are by no means drawn from the inroads which are being made in the profession by incompetent men having no claim whatever to the title "architect."

Reference has been too often made to the inherent social status enjoyed by the professions of law and medicine. I thoroughly agree with "Architect" when he says that notwithstanding the difference between the status of one of these professions and the profession of architecture, the responsibilities of the architect are greater than either. The mistake of a doctor dies with his patient; the mistake of a lawyer can be always attributed to the clinging of the bench or the jury; but the mistake of an architect is always before the public gaze.

The responsibilities of the architect cease with the final certificate. He gives his certificate when to all appearances the work is satisfactorily done. But by-and-by the low sashes rattle just a little; a slate or two and a few ridge tiles are blown off in a gale; a smoke flue fails to act satisfactorily; and a slight settlement may possibly begin to show

itself; timber flooring laid in December shrinks somewhat in the following July, &c. Is the builder blamed for these defects? Nothing of the kind. Did he not carry out the works according to plans and specifications and under the direction of the architect? Neither the client nor the public will blame the builder, but the humblest member of the community will criticise the work of the architect and point out its defects.

The trying and stringent examinations to qualify for membership of the Institute are to be highly commended; but are these examinations calculated to cope with the evils complained of? I say most decidedly they are not. So long as the profession is open to all comers the evil must remain, and in reality it is bound to increase rather than decrease as time advances and technical education progresses. Plans, elevations, sections, details, specifications, bills of quantities of every class of structure in the kingdom, are now published weekly in journals within the reach of all. Drawing and building construction are now taught in various Technical and Art Schools throughout the country, at night as well as in the day time, to help the working classes. What is there, I ask, to prevent any steady, intelligent, ambitious artisan connected with the building trades from becoming an architect under such a condition of things as these? As a matter of fact there is nothing to prevent him, and who could blame him for taking advantage of such favourable facilities?

If then, it is not to be registration, let it be something equally effective. But that some protection of the kind is urgently required, few architects, at least provincial architects, will, I think, deny. A Registration Act has been passed by some of the State Assemblies of America with highly satisfactory results, and it is expected that it will be but a matter of a little time to have it extended to all the States. The Central Society of Architects of Belgium have had before them, at their monthly meeting in Brussels on the 5th inst., a report by a Commission appointed some time ago to inquire into the subject of State recognition and the formation of a "National Professional Union of Architects."

I trust, Mr. Editor, with your kind permission, that we may be favoured with the views of some of the leading lights of the profession now that the subject is open.—Yours obediently,  
 "TRANSITION."

*To the Editor of THE BUILDERS' JOURNAL.*

LEWISHAM, S.E.

SIR,—I am glad that you have opened your valuable columns for the opinions of the members of the profession on this subject, for it is a most important one, both to the architects themselves, and to the public generally; it is a question that must be very shortly definitely answered, and the answer from all *bona-fide* practitioners will be, I am sure, an overwhelming "Yes" in its favour.

The Royal Institute of British Architects (of which body I have been a member for eighteen years) have, for some inscrutable and feeble reasons, always opposed registration. I presume that such opposition was caused in the first place simply because the Institute did not originally suggest it, but left it to a much younger and more vigorous society to do so. When the question came up before a very small meeting of the members of the Institute, it was suggested (apparently much against the Council's wishes) that voting papers be sent to every member of the Institute to obtain opinions on the subject. This was done—but, alas! the voting papers were drawn up in such tangled and confused terms that it was most difficult to understand whether one was voting "Yes" or "No" in answer to them, and I verily believe that numbers of "Yes" votes were lost by this means.

Registration would undoubtedly enhance the status of an architect in the eyes of the public. Take, for instance, the case of the accountants, how vastly they have improved their position since they became "chartered accountants," and what esprit-de-corps this has given them. These gentlemen even sneer at an archi-

tect's position, for as an accountant friend of mine truly but bluntly says, "any bricklayer, undertaker, or house agent, without any training whatever, can label himself 'architect,' but they are prohibited by law from calling themselves 'chartered accountants,' hence the accountant is much more respected by the public than an architect is."

Again a chartered accountant can enforce his statutory charges at law, an architect cannot do so, for we have no statutory scale of charges; it is true the Institute have issued a "Schedule of Professional Charges," but this schedule is merely a suggestion from the Institute, and like most of its other suggestions it is sneered at by the public authorities and not recognised by Her Majesty's judges.

Another strong point in favour of registration is, that architects' pupils would receive a much better training than they obtain now; for if it were known that a pupil *must* undergo some examination, before being admitted to practice, his master would be obliged to give him much more attention than is usually given now, and teach him something at least to fit him for such examination. How many pupils are personally taught by their masters now? The unfortunate pupil at present is, as a rule, a mere drudge in the office. After having paid a (sometimes) heavy premium he is generally employed to save an office boy's expenses, and put on to copy and post letters, keep the 'call and petty cash books, and run errands, and, as he gets older, to make tracings; but if he wants to learn anything of his profession he is compelled to join classes outside the office, instead of learning there what his master had agreed to teach him. In large offices this evil is worse than in smaller ones, as in the former case the unfortunate pupil is not only the drudge of his master, but has to fag for the assistants as well.

In no other profession do masters so much neglect the real professional education of their pupils as they do, generally, in that of architecture. The lawyer's articled clerk is a superior person in the office, and a confidant of his master; the young medical student is in intimate and confidential touch with some skilful and qualified practitioner, who is anxious to help and teach him personally; but then both the lawyer and the doctor belong to "registered" professions, and hence their pupils receive much better training than that of the unfortunate young architect.

If we could galvanise our feeble Institute into active life, and induce it to open its eyes to the signs of the times, and to the earnest endeavours of the younger men in the profession (who also seem to be the more active and clever men) to raise themselves and their art to the position they and it are entitled to; then we should hear of no more opposition to registration from within our own body, but a cheerful alacrity in its acceptance.

The action of the Institute may be summed up as a rule as one of "meddle and muddle." Any suggestion it makes is ignored in nearly all quarters, but there is one most dangerous action that the members of the Council have just arrogated to themselves—viz., the power to select and appoint architects as competitors for important public works. This power, I understand, the Council has just exercised, and has selected six architects to compete for the rebuilding of the Old Bailey in the City of London—a most important undertaking. The Chairman at the last meeting of the Institute stated that it was "public knowledge who these gentlemen were;" but I have not yet found any one of the public who is acquainted with the names of these "chosen ones."

Surely it must be a most unfortunate thing for young, or comparatively unknown, men, that the Council of the Institute should be entrusted with the power of selecting competitors; for it means the shutting out of all but men with well-known names, as only such would be known to the charmed circle of "the Council." Surely, apart from the inevitable favouritism, such powers of selection, if generally exercised, would reduce our already poor Architecture to within still narrower limits of style, and destroy all fresh-

ness and originality of ideas that we do occasionally obtain from outsiders, who are neither "Members of Council" nor "well-known architects." Public competition, when fairly conducted, is wholesome and useful; it has been the means of bringing forward many poor, unknown but gifted men to the front, but if this wholesome trait is to be strangled by the efforts of some publicly unrecognised "Council" or other, then our state is parlous indeed.

Some vigorous action should be taken at once to obtain a really reliable and representative return of the opinions of every practising architect throughout the Empire on the important subject of registration, and if its great advantages were properly set out, again I say the answer would be unanimous in its favour.—Your obedient Servant,

HORACE T. BONNER, A.R.I.B.A.

## Enquiries Answered.

*The services of a large staff of experts, including all those engaged on "Specification," are at the disposal of readers who require information on architectural, constructional, or legal matters. Questions should in all cases be addressed to the Editor.*

### PREPARATION OF WALL FOR PAPERING.

To the Editor of THE BUILDERS' JOURNAL.  
LEEDS.

DEAR SIR,—I should be glad if your correspondents could suggest a remedy to improve a new plaster wall.

It has been injured by wet driving through from outside; this has been remedied, and plaster is dry, but is covered with a precipitate of lime or soda. The wall was built with sea sand.—Yours truly,

"T. C. G."

The efflorescence on the surface of plaster wall is doubtless due to the sea sand used for building the wall. Allow the wall to stand bare as long as possible before papering it. While bare clear off daily any efflorescence which may arise on the surface. In time the amount of efflorescence will decrease, and, when scarcely perceptible, well scrub the wall with a dry brush or a coarse cloth, and then brush the surface with a solution of Parian cement. After this is dry you may proceed with the papering without fear of further injury or discolouration of the surface. If time will not permit of waiting for daily dusting, &c., free the surface from all existing efflorescence, then give the surface a coat of thin patent knotting, and then paper the wall.

W. MILLAR.

### MEASURING-UP CHURCHES.

To the Editor of THE BUILDERS' JOURNAL.  
LONDON, E.

SIR,—I have lately made various studies of one of the historic churches of Kent, one of them being a measured plan. This is the first time I have taken in hand a building of this class, therefore I have had a number of difficulties. For instance, when I have taken the position of the nave pillars and then the buttresses I have found that they do not come directly opposite one another. No doubt this is because I have not gone about my measuring in a professional kind of way. Another difficulty is how to get the thickness of the various walls when there is no opening by which I can get a through dimension. Can you give me directions how to go about the measuring-up of these buildings?—Yours faithfully,

"NESWOR."

It is by no means uncommon, when measuring Gothic work, to find that piers and buttresses do not come exactly opposite each other. It is not an easy task to measure the plan of an old church, as usually from various causes, walls, &c., which appear to be at right angles to one another, are not so. Supposing the church you are measuring to consist of nave, aisles, and chancel, we should suggest first accurately plotting the nave piers, then taking a centre

axial line right down the centre and from certain points, marked on the floor in chalk, taking cross diagonal measurements to the principal features of the side walls as piers, windows, &c. If possible continue your centre axial line through church wall into churchyard, and thus form a connecting link with the second operation, namely, setting out the exterior. To do this stake out a rectangular figure outside the church and measure the offsets to buttresses, porch, &c. You can, of course, only accurately take the thickness of a wall wherever a window or doorway occurs, and it is rare indeed when no opportunity whatever occurs; to make an absolutely accurate plan you will have to get the thickness at a great many points, in fact, it is better to do so at every possible position. If there is any stone vaulting or roof work to be planned, procure a lead pointer and, having chalked the point, suspend it from the centre of the boss (stove rib or whatever part of the roof you desire to plot) until it touches the floor of the church, when you will be able to accurately plot the chalk mark on your plan. In measuring stone vaulting it is best to thus draw out in chalk a plan of the vault above on the pavement below.

H. I. T.

## ASPECT AND SOIL

IN RELATION TO

### THE DWELLING-HOUSE.\*

BY V. G. POORE, F.R.C.P.

(Concluded from page 221, No. ccxviii.)

I NEED hardly say that even the isolated cottage must be under control as regards cesspools or any underground sanitary abominations, which may be an unseen danger to the neighbours, but I am very strongly of opinion that, on the grounds of the health and safety of the public, builders of isolated dwellings ought not to be harassed by by-laws, which are in their case merely a source of delay and increased expense.

In these days of railways, trams, motor cars, telegraphs, telephones, and bicycles, machines which have practically multiplied time, and, to a great extent, annihilated space, it ought to be possible for populations to spread out and to live more decently and wholesomely than is the case in crowded cities.

It ought to be possible to build detached houses in increasing numbers, and as a consequence to give to the chief rooms of the house any aspect which may be desired.

The question of Soil in relation to the dwelling is necessarily one of great importance.

Assuming, in the first instance, that the soil selected is a pure soil, I may as well say that I have no evidence to bring before you that in the matter of wholesomeness there is any difference between rocks, sand, gravel, or chalk, and I am not aware that there is any evidence that either of these soils gives rise to unwholesome emanations.

The interstices of all porous soils are filled with air and a certain excess of carbonic acid, which may be considerable if there be much organic matter in the soil, and a house with lighted fires necessarily tends to aspirate the gases from the earth upon which it is built. Now I am not aware that there is any real evidence to show that damage has ever resulted to persons from the gases emanating from a pure soil.

In cities, where organic filth has been buried in the soil for ages, it seems likely that the gases of putrefaction may gain access to the house. In London we know that when the soil is opened up there is always a stink of illuminating gas, and obviously, it is desirable to keep that out of our dwellings. Further, we know that impurities from sewers and cesspools are sure, under the existing order of things, to leak into the soils of populous places. Therefore, the model by-laws insist that the ground upon which a house is built shall

be covered with a regulation thickness of concrete. This is a reasonable provision in a populous place, but I would remark that, so soon as a crack or pinhole is accidentally made in the concrete, the alleged security given by it vanishes. In country places which have adopted the model by-laws, the covering of pure chalk or sand or gravel with concrete is equally insisted upon before a cottage can be built. This has the effect of increasing the cost and rent of the cottage, unless it be thought advisable to make the floor of concrete finished with cement. It goes without saying that for houses built in low-lying damp situations, an impermeable layer of concrete is necessary. The above remarks are intended to apply to concrete as a barrier against the gases in dry soils.

The soil upon which a house is built influences the comfort and therefore the health of the dwellers. On a dry soil it is possible to take exercise in comfort, while on stiff clay soils walking or any other exercise in the winter months is a disagreeable and dirty proceeding.

It is quite possible to build a house upon clay which shall be perfectly dry, and through clay unwholesome gases find it difficult to travel, which is a theoretical advantage. Fogs are frequent on clay lands, but it is not clear that an occasional pure fog does any harm to a healthy person. I say nothing of the foul irritating fogs of London, which are dangerous to many and deadly to not a few.

The nature of the soil upon which a house is built has great influence on the ease with which the waste drainage waters are got rid of. On porous soils, such as sand, gravel, and many chalks—they soak away, and hence there has been a great temptation on such soils to construct soak-away cesspools, which in the days of our ancestors, before the use of water-closets and fixed baths, or even daily "tubs" became general, were little likely to contain infective matter, and continued to act efficiently for years. Modern sanitation has raised the amount of waste water enormously, and the invention of the water-closet has greatly increased the danger and foulness of the waste waters. It is probable that the amount of sewage to be dealt with in country houses, has, in modern times, as compared with the last century, been multiplied by ten, and it is now quite common for the owner of a biggish country house with stables to have to grapple with 1000 gallons of sewage per diem, or 160 cubic ft., an amount which will stand about an inch high on an area measuring 50ft. in length and 40ft. wide, or which, in a month, will fill a water-tight cesspool measuring 24ft. by 20ft. and 10ft. deep—the dimensions of a fine dining-room—and containing, when full, more than 130 tons of foul liquid, which will all have to be raised and distributed. On a porous soil such an amount of fluid if delivered on the surface of the ground, may be got rid of with ease and without offence, if the few pounds weight of excreta (12lbs. at the outside) of the twenty-five people living in one country house be dealt with separately.

On a clay soil, especially in winter, a very much larger area of ground must be used for the waste water.

The foulness of the River Brent, of which we have heard so much, is probably due to the fact that the foul liquids on the clay soil through which it flows, tend to run off the surface instead of percolating through the soil and thereby becoming purified.

I must not pursue this subject further, as it is not my intention to discuss the question of slop-drainage and sewage treatment, which I have dealt with at length in my little book, "The Dwelling House." I will merely add that, whether a house be on a permeable or impermeable soil:—

1. All waste fluids should be dealt with before putrefaction sets in.

2. They should be delivered on to the surface and not beneath the surface of the ground.

3. They should never be allowed to collect in cesspools which encourage putrefaction, and merely postpone the inevitable work of distributing them over the ground.

\* A paper read before the Architectural Society on May 12th.

## Bricks and Mortar.

EFFINGHAM HOUSE, ARUNDEL STREET,  
May 24th, 1899.

"I know what it is to live in a cottage with a deal floor and roof, and a hearth of mica slate; and I know it to be in many respects healthier and happier than living between a Turkey carpet and a gilded ceiling, beside a steel grate and a polished fender. I do not say that such things have not their place and propriety; but I say this, emphatically, that the tenth part of the expense which is sacrificed in domestic vanities, if not absolutely and meaninglessly lost in domestic discomforts and incumbrances, would, if collectively offered and wisely employed, build a marble church for every town in England; such a church as it should be a joy and a blessing ever to pass near in our daily ways and walks, as it would bring the light into the eyes to see from afar, lifting its fair height above the purple crowd of humble roofs."—JOHN RUSKIN.

**St. Paul's Churchyard.** A FEW weeks ago we pointed out the undesirability, from an aesthetic point of view, of rebuilding the premises that have been pulled down at the Cheapside corner of St. Paul's Churchyard, and advocated a still further demolition of the houses by which the

CARVED OAK PANEL. BY A. CLAYENDEN MOTTE.

Cathedral is so closely hemmed in on the north side. The same idea is being put forward in other quarters. To the aesthetic argument is added the important one of public convenience. "The roadway, now barred and useless for the passage of vehicles, is," says Mr. Deacon, in a recent letter to the "Times," "the natural continuation of Cheapside and Ludgate Hill, and I cannot help regarding it as extremely discreditable to the Corporation that they should have discouraged every effort and ignored every representation to widen and throw it open for traffic." The writer further states that the continuation of the great main artery of London traffic along the north side of St. Paul's Cathedral was a part of the scheme formulated by Sir Christopher Wren for laying out the thoroughfares of London after its destruction by the Great Fire of 1666. It is rarely, indeed, that the chance of carrying out so splendid an improvement in the City presents itself; the Corporation will win the gratitude of all who care for the dignity and beauty of the Metropolis if they decide to avail themselves of this golden opportunity.

**A Shocking Example.** THE other evening, in the House of Lords, the Marquis of Lothian asked Her Majesty's Government whether they would cause a model of the proposed new buildings for the War Office to be made and placed in the precincts of the House for the inspection of the members of both Houses. The necessity

of having such a model, he said, was shown by what happened in the case of the new Admiralty buildings. When a model was produced of the plan first accepted, it was found that the proposed buildings would be such monstrosities that an entirely new plan had to be resorted to. He said that the present Admiralty buildings were absolutely unworthy of the office they had to house. The architecture was weak where it ought to be strong, and there was at the top of the building a sort of trimming, which appeared to be taken out of a child's box of bricks. When the new Admiralty was finished, it would not be large enough for its purpose, and it would be necessary either to add another storey, or to provide a fresh building elsewhere.

**The Reply.** In reply to this plain-spoken criticism, the Earl of Pembroke said he was afraid he could not give much comfort to his noble friend. The First Commissioner of Works did not see his way to grant the request with respect to a model of the new buildings. At the same time, as, perhaps, the noble lord was aware, the plans and elevation of these proposed new buildings had been in the tea-room of the House of Commons for some time, and he was quite sure that his right hon. friend would be glad to show them to any noble lord who took an interest in the matter. With respect to the present new Admiralty, one must remind his noble friend that that magnificent edifice was the result of a committee of the House of Commons. This did not encourage his right hon. friend to carry on the same procedure with respect to the further buildings to be erected as was done in the case of the Admiralty.—The Marquis of Lothian said that the plans and elevations were absolutely of no use for the purpose.

**Two Panels.** THE two panels in carved Italian Walnut, here illustrated, are for an important work by a leading firm of West End cabinet-makers. They have been carried out by Mr. A. Clayenden Motte, of 14, Glynfield Road, Craven Park, N.W. This work is now in one of the finest collections in this country, and is one out of many high class works executed by Mr. Motte, who has had an extensive connection with the Furnishing and Decorative trade. Judging from the specimens of "artistic" furniture one sometimes sees, there would seem to be abundant scope for architects with a taste for this kind of work to devote their abilities to the beautifying of our homes.

**Dr. Syntax Inn.** ANOTHER interesting link with the past is about to be lost. The old-fashioned hostelry at Prudhoe, called Dr. Syntax Inn, is to be demolished to make way for the erection of an inn of the modern type. The house was one of the oldest on Tyneside, and formed one of the most picturesque objects in the locality. It was formerly one of a row of thatched buildings, and about one hundred years ago it was rebuilt. The work of demolition has revealed that scarcely any iron was used in its construction, the woodwork of the roof, doors, and windows having been put together with bone or oak pins and wooden couplings. Prudhoe is a prosperous village, rapidly growing in population and wealth, and its development is shown by the numerous modern buildings which have been erected.

**The Alfred Memorial.** A PETITION, signed by Lord Ashcombe, Mr. Melville Portal, Mr. W. W. Portal, Mr. Montague G. Knight, Mr. F. Willan, and Admiral Field, M.P., has been sent to the Ecclesiastical Commissioners, relative to the proposal to erect a museum in the grounds of Wolvesey Castle, Winchester. The petition asks that the Ecclesiastical Commissioners will decline to alienate any portion of the Wolvesey grounds for the purpose of erecting a hall or museum as a memorial to King Alfred, as in the possible event of the palace being at a future date required for the Episcopal residence, the alienation would be a grave inconvenience. They think that the erection

of a hall or museum to contain a non-existent collection of Anglo-Saxon antiquities is in itself an anomaly, and if such collection should be forthcoming, it is in London and not in a small provincial town, however historically famous, that the student and the antiquarian would prefer to locate it. To place any such edifice among the venerable walls of Wolvesey is, they say, both incongruous and inappropriate. In answer to this petition, the Ecclesiastical Commissioners have assured the petitioners that they have no intention of taking any steps for alienating any part of the Wolvesey Palace grounds.

### Tudor House.

THE fate of this historic building is not yet finally settled, but there seems to be a very good chance of its being rescued from demolition. At the meeting of the London County Council last week the recommendation to pull it down gave rise to considerable discussion. Mr. R. Seager said that professional men and members of antiquarian societies who had seen this house were unanimously of opinion that to pull the building down would be a loss not only to the neighbourhood but to London. In answer to this Mr. Torrance said it was nothing less than a crime to attempt in this crowded neighbourhood to rob the people of part of an open space by retaining a ramshackle house which contained nothing really of historic interest. Colonel Rotton said the only thing of interest about the

CARVED OAK PANEL. BY A. CLAYENDEN MOTTE.

house was the staircase, and it would be a sin for that only to retain a house occupying so much ground which could be used by the public. It would cost at least £500 to put in decent repair, and that sum of money would be better spent in laying out the ground. In the end it was decided to refer the recommendation back to the committee, and the house is saved—for a time.

### Rival Building Stones.

WE mentioned, some time back, that the architect of the Colchester Town Council had suggested the use of Owen stone, in the place of Portland stone, in the construction of the Victoria Tower of the new Town Hall, as by doing so about £300 would be saved. A sub-committee was appointed to visit the works of the Owen Stone Company, at Worplesden. This visit does not seem to have impressed them favourably with the value of the stone, as on their return they stated they were unanimously of opinion that they could not undertake the responsibility of recommending the use of the Company's material in the tower of the new Town Hall. The Town Council were then between two stools; they did not know whether to decide to use Portland stone and spend £300 more than they desired, or use Owen stone and risk the consequences. At last they came to the conclusion that by a little alteration in the method of construction, a great reduction may be made in the total cost, which will enable them to use Portland stone.

## Professional Practice.

**Dundee.**—The foundation stone of St. Roque's Church was laid recently. The cost is estimated at about £2,000. The plans have been prepared by Mr T. Martin Cappon, F.R.I.B.A., and the following are the contractors for the building:—Mr. William Anderson, mason; Mr T. C. Stocks, joiner; Mr William Brand, slater; Mr Michael Lawless, plasterer; and Mr John Crichton, plumber.

**Fraserburgh.**—The parish church has been undergoing extensive alterations during the past year, and was re-opened recently. The work has been carried out under the supervision of Mr. M. Mackenzie, architect, of Aberdeen. The church has been lengthened to the extent of 14ft. by the taking in of the old vestry and session house. The organ has been redecorated, and the pulpit has been removed to the apse. A large session house and vestry has been placed under the pulpit gallery. Furnaces for the new air heating apparatus have been placed underground. The decorations and stained glass work were executed by Mr. E. Copland, of 85, Rosemount Viaduct, Aberdeen. The contractors for the other portions of the work were:—Mason, Mr. Corbett, of New Pitsligo; joiner, Messrs. Brehner and Jenkins; slater, Mr. Thomson; plasterer, Mr. Wiseman; plumber, Mr. Ferguson; heating engineer, Mr. J. Grundy, of London.

**Ipswich.**—A new workhouse was opened recently, which had been built from designs by Messrs. Salter and Adams, of 28, Woburn Place, London. Mr. W. Lister Newcombe, of 89, Pilgrim Street, Newcastle-on-Tyne, working in conjunction. Messrs. G. Grimwood and Sons, of Ipswich, were the contractors, and their tender amounted to £25,773. The main buildings are recessed 200ft. from the Woodbridge Road. They consist of a central administrative block and two pavilions. There is a spacious dining hall behind the central block, and rooms are set apart for the boilers, gas engine, and coal stores. The whole of the buildings will accommodate some 369 paupers, and are entirely lighted by electricity.

**Llanely.**—A new school was opened at Llanely last week, providing accommodation for 770 children. It has been built from plans prepared by J. B. Morgan, M.S.A., of Llanely.

**Keighley.**—The proprietors of the Queen's Theatre have let the main contract for the reconstruction and enlargement of the theatre to Messrs. Greenhow and Murgatroyd, of Keighley. The elevation of the new premises to Queen Street will be 83ft. in width, the auditorium will be 56ft. by 60ft., and the stage will be 65ft. by 45ft., with a height of 60ft. The work will be done from plans prepared by Mr. F. Matcham, architect, of London, and it is claimed that the new premises will form one of the handsomest theatres in the provinces. The work will not be completed before November. In land and buildings the promoters of the new theatre are expecting to lay out nearly £20,000.

**London, E.C.**—At the meeting of the London County Council held last week, on the recommendation of the Building Act Committee, consent was given to the rebuilding of 116, Fore Street, Cripplegate, with a projecting oriel window as shown on the plan submitted by Messrs. N. S. Joseph, Son, and Smitham, on behalf of the trustees of the Cripplegate Bank. It was also agreed to give consent to the erection of two angle turrets to a proposed building on the site of Vulcan Wharf, on the south side of Upper Thames Street, such consent, however, being subject to certain conditions. The Council has given permission for the erection of a building on the south side of Tallis Street, Victoria Embankment, between the premises of the "Daily Mail" and the National Telephone Co., to the height shown on the plans submitted on behalf of Messrs. Harmsworth Bros.

## Views and Reviews.

### FRENCH ART AND ARCHITECTURE.

Miss Kingsley has essayed to compress the whole of the history of French art during a period of 799 years into a volume of 509 pages. The task is a considerable one, and we were astonished to see it accomplished. But when the book is examined, one's astonishment grows less. For it may be divided into two sections: French Art from the period 1100 to 1475; and French art from 1475 to 1899. When we find that the first period of 375 years is given the happy despatch in twenty-one pages, we can only surmise that the authoress is either indifferent to or contemptuous of early French art. That is the first point about the book. It is a history of French art not from 1100 but from 1475 to the present day; the title is a misnomer.

After this grievous disappointment we turned to see how architecture was treated. Miss Kingsley promised well. On page 8 is a magnificent programme. Architecture is not to be a Cinderella any longer, thrust aside by painting and sculpture. The book is to describe "the Romanesque of the South and the North; the Gothic; the Flamboyant; the effect of the Italian Renaissance on the French architects; the gradual development of the purely French style"—how could it be purely French if there was Italian influence?—"the magnificences of Louis XIV.; and the later classical revival." Alas! the programme was but a snare and a delusion. To put it arithmetically, the importance of French painting and sculpture, as compared with that of French architecture, is as five to one; for more than 400 pages are devoted to the former, only eighty pages to the latter. Architecture is a Cinderella after all. Yet the most glorious manifestation of French intellect is to be seen in its great architecture—its thirteenth century cathedrals, its sixteenth century chateaux. French pictures and French statuary are rivalled or surpassed elsewhere; its architecture is the supreme achievement of French genius.

What little there is of architecture we have read. French Romanesque and French Gothic did not detain us long; eight pages contain all that Miss Kingsley knows about them—some things, too, that she does not know. She is unhappy in her very first quotation, which tells us that what distinguishes French from all other European Architecture is that it has been cultivated in various original and distinct schools, working in different provinces—a remark which is far truer of Italy than it is of France. We are told that in the early Romanesque churches the pillars were thick and round. If Miss Kingsley travels through Normandy and England, she will find that these cylinders are work of the twelfth, not of the eleventh century. Romanesque in France, we are told, is of two styles, those of Southern Gaul and Normandy; which is as if one should divide Great Britain into England and Caithness. Anthyme St. Paul hesitates between a classification of six groups and eighteen schools. Without subdividing so far as that, we would suggest that the Romanesque churches cannot be reduced to less than three types; those covered with barrel vaults; those covered with domes; those covered with groined or ribbed vaults. Of course, too, the old Byzantine fallacy is trotted out once more, and is supposed to account for the abbeys of Vezelay, Charlieu, and Cluny. The Byzantine crops up periodically in the literature of Perigordian architecture, but what is he doing in Burgundy? But it is when we get to Perigieux itself that the fogs most thicken. St. Front, Perigieux, is stated to have been copied from St. Mark's, Venice, before St. Mark's, Venice, was built. And St. Front itself in the eleventh century, i.e., before it was built, is said to have had great influence on the churches of Aquitaine. We hear, too, that at St. Etienne de Nevers, "all the thrusts are thoroughly maintained"—a very remarkable phrase indeed. As for the construction of this and suchlike churches, nothing can be more risky and unsafe; the barrel-vault of the nave rises from a lofty clerestory wall,

which is without any buttresses, and, moreover, is pierced with windows. The result is that the vault is cracked in all directions. But Miss Kingsley's highest architectural flight is in describing the churches of Auvergne "with demi-vaults resting upon the walls of the clerestory and supporting the central vault;" the natural interpretation of which would seem to be that the barrel-vault of the nave rests on a demi-berceau, and the demi-berceau on the top of the clerestory wall—an internal elevation without parallel.

But let us hasten from the eight pages of Romanesque and Gothic to the twenty-one pages of nineteenth-century architecture. There we have twenty-one pages given to the architects as against 231 to the painters and sculptors. Miss Kingsley is of opinion that in the present century French painting and sculpture are exactly eleven times as important as French architecture. Rather rough on the French architects; still we are not sure that she is, not right. The twenty-one pages are padded with quotations and biographies; we are told to admire Garnier's meretricious Opera-house, mother of all gin-palaces. We are not told how abominable was the church-work of M. Viollet-le-Duc; beside his parish church at St. Denis, Scott's works are genuine original inspirations. The commission des Monuments Historiques is eulogised, its object being, "to oppose the destruction of a national monument by the owner." The real object is to keep the work and wages of destruction in the hands of what in France answers to our South Kensington gang; the select band of architects who get their wages for ruining the ancient monuments in France; among whom not the least noteworthy were M. Viollet-le-Duc—witness his treatment of Poissy—and M. Beswillard, who has been restoring Laon Cathedral for some forty years—so drastically that the vaulting of the whole south aisle of the choir and the whole of the south transept are shored up against imminent collapse. Or look at another of these vandals, French Wyatts, M. Abadie, who was set to restore St. Front, Perigieux; and restored it with pointed arches, pendentives, and dome all destroyed in favour of a new and more normal design by M. Abadie. Of all the churches in France, the one with the oldest and most authentic pedigree was that of Germigny-des-Prés. It was built in the reign of Charlemagne in the year 806. Of this most precious monument not one stone has been left on another, two capitals excepted. English restorations are child's play to what is done in France. Only in out-of-the-way churches like Auxerre and St. Quentin may we hope to find anything ancient and veritable left. But year by year the area of ancient art diminishes. Miss Kingsley would do well to quote no more panegyrics on the Commission for the Destruction of Historical Buildings. The rest of the book—the great bulk of it—consists of chapters on painting and sculpture. Of these chapters more than half are occupied with detached biographies of various artists, compiled from various dictionaries of biography. As may be imagined, there is much "confused feeding" in them, as in a Scotch haggis; and as the man complained who was working through Johnson's dictionary, it is somewhat disconnected reading. Of the rest of the book, Renaissance art has been treated better by Lady Dilke, from whom Miss Kingsley borrows copiously, and by others. The really interesting part of the book is the detailed account of modern painting and sculpture in France. Most of us, when we see the Salon or the Luxembourg, do not know what it is all about. Miss Kingsley discourses pleasantly about the Classicists, the Romanticists, the Landscape Painters, the Peasant Painters, the Military Painters, the Genre Painters, the Orientalists, the Decoratists, the Idealists, and the Impressionists. This is the really valuable part of the book. In her next edition Miss Kingsley would do well to confine herself to nineteenth century work which she knows at first hand; to say nothing about the Romanesque, Gothic and Renaissance periods; and, above all, to let architecture alone.—F. B.

"A History of French Art, 1100—1899," by Rose G. Kingsley. 12s. 6d. net. London: Longmans, Green and Company, 1899.

**THE ORIGINS OF DECORATION.**

This is one of the popular issues for which the name of Messrs. Cassell is well known. The volume is presumably a reprint from "Work," a paper which has deservedly a wide circulation, and holds a high place as a popular educator. This little book, in some 150 pages, interspersed with nearly three hundred cuts illustrative of the text, gives a summary of the chief characteristics of the earliest impulses in design of the various races. To attempt such a task in so small a space implies of necessity a superficial treatment; but though the text is not from the pen of one who is a master of his subject, and the illustrations are too rough to give a just rendering of the subtlety of Greek, Pompeian, Japanese, and other refined arts, it yet affords such a general sketch and summary of the subject as would be of use to one who should desire to make a tentative first acquaintance with the origins of decorative design. Perhaps the extremely low price of the book constitutes its chief recommendation.

"Decorative Designs of all Ages for all Purposes." Cassell and Co., La Belle Sauvage, London, E.C. 1s.

**JAPANESE WOOD-CARVING.**

It is well for the public that the Editor of the "Studio" has leisure for writing occasionally, for probably no one is better acquainted with Japanese life and art. To the neat little series of "Unicorn Quartos" he has lately contributed a volume on Hokusai, painter-engraver, and now offers this eminently practical book to the student.

It is certainly true that the history and manners of a nation that produces such marvels deserve to be very attentively studied, and we of these hasty days who depend so much on the labours of others for what little knowledge we have are grateful indeed—not for all that is written, but for as much as is briefly stated and thorough.

The "Japanese craze," as it is called, and as the contemptuous expression implies, was indiscriminate in its beginnings as crazes in general. It originated in the wholesale importation of wonders, the like whereof had not theretofore been seen in this country, but only lately have we had time to take stock of new possessions: to select and reflect, in short.

That this little book has helped us to understand what we only admired before might be proved by extracting a passage from the introduction, but the writer's chief aim is to teach, and the book is really what it claims to be, a practical manual, and its most admirable illustrations are quite indispensable. We are shown first the wood-carver's tools, and then, step by step, what is done with them. Let no one hereafter despise the Japanese hewer of wood, for wood is his all in all, and has been from the beginning of time, according to his way of reckoning. "The physical characteristics of Japan—the prevalence of earthquakes and earth-tremors—which prohibited the use of heavy material for building purposes have ordained the employment of wood as best adapted to resist these disturbances, . . . and temples of wood exist in Japan, built as far back as the ninth and tenth centuries of our era, which . . . exhibit in a far less degree the ravages of time than the stone buildings of the same age in Europe. . . . As much respect is probably paid in Japan to the memory of their most eminent wood-carvers as is bestowed in Europe upon the achievements of Phidias." There is that which should give us pause in this sentence, and in conclusion it may be asked whether familiarity with the Japanese method may not result in the "Sloyd" schools being gradually emptied.—E. R.

A course of instruction in wood-carving according to the Japanese method. A "Studio" handbook. By Charles Holme.

**Under Discussion.****EDINBURGH ARCHITECTURAL SOCIETY.**

On Wednesday, May 10th, the closing meeting of the Edinburgh Architectural Society for the session took place, when Mr. John Ednie read a paper on "Furniture." After reviewing the styles of furniture from the Renaissance to the present day with the aid of choice and characteristic specimens thrown on the screen, Mr. Ednie discussed the modern adverse conditions, of which commercialism was the chief. With regard to the study of furniture Mr. Ednie had a good deal to say, advising thorough and careful full sizing of really good examples of the various styles purely as study and not with a view to reproduction. His concluding remarks constituted a strong plea for what he termed the "Arts and Crafts" style, examples of which, emanating from Glasgow and Germany, were shown. In the discussion which followed the new style was freely criticised, and the personal qualities of style as opposed to mannerism and affectation were put forward. Mr. A. Lorne Campbell occupied the chair.

**ST. MICHAEL'S, BASSISHAW.**

During the destruction of the Church of St. Michael, Bassishaw, members of the London and Middlesex Archaeological Society have watched the removal of the masonry with keen interest. The work of demolition has not reached the outer walls yet, but it has already led to some notable discoveries. On Monday evening last week Mr. C. Welch read to a meeting of the Society a paper by himself and Mr. F. C. Eeles on what had been found, and prefaced his remarks on this head with an interesting epitome of the history of the parish ward of Bassishaw. The church was extensively repaired in 1630, but was reduced to ashes in the great fire of 1666. The repairs so impoverished the parish that for ten years the people were unable to attempt the task of re-building, and it was not until 1676 that the work was taken in hand by Wren, being completed three years later. Its length was 70ft.; width, 50ft.; height, 42ft.; and height of the tower, 75ft. One remarkable reference to Wren was made in the portion of the paper written by Mr. Eeles, who said that Wren built large brick arches to support his new west end walls. That on the north side stretched right across the aisle, but after its erection it gave way, owing to a large buttress for the tower being built upon it. The consequence was that it had to be shored up. It was sad, pursued the writer, to find such an instance of gross carelessness on Wren's part, but it was only of a piece with the rest of the church, which was a regular case of seventeenth century jerry building. A number of curious steps were found leading from one floor to another, and there were many indications of fourteenth and fifteenth century work, whilst a very curious find was that of an empty vault, in which two skulls had been built into the brickwork. A large number of tobacco pipes, probably belonging to Wren's workmen, were found, together with a fine "cross slab" from the early part of the thirteenth century. A sketch of the church appeared in a recent number of the BUILDERS' JOURNAL AND ARCHITECTURAL RECORD.

**THE USE OF HEAT FROM DESTRUCTORS.**

At a meeting of the Incorporated Association of Municipal and County Engineers, held recently at Ipswich, Mr. A. H. Campbell, of Canterbury, read a paper on the use of heat from destructors to assist in steam generation. He said that the utilisation of the waste heat from the cremation of the refuse of a town was a question of a thoroughly economic kind, and of prime importance, therefore, to our municipal economists. That there was much latent heat and power contained in the cremation of town refuse went without saying; that there was not so much in it as some of its enthusiasts aver, was evident from the

very few joint stations which had as yet been erected. Town refuse, like sewage, he said, was always with them, and there was a sufficiency of power contained in the cremation of refuse to justify full inquiry and careful research and investigation by those having the requisite facilities of test and observation of the matter. And at the very lowest estimate, it was the turning to the profitable use of a measure of power hitherto unappreciated or left undeveloped. The leading principles or ideas which governed the design of the buildings and the disposition of the plant therein contained were: (1) That there should be no possibility of dust from the refuse entering the engine-house, and so doing damage to the electric plant; (2) that the dust destructor should work either alone or in combination with the electric plant; (3) that the capacity of the destructor cells should be such that each day's refuse collection should be effectually cremated within the space of ten hours, beginning at noon of each day and going on till ten at night; (4) that the power developed during the day hours of light load should go to charge the accumulators (a process which he was advised would take from four to six hours); (5) that by the time the accumulators were stored the night load would be coming on, and this would more than absorb the power given off from the destructor. With these five principles, a very convenient arrangement of buildings has been adopted, the boiler attached to the refuse destructor being in very close proximity to the cells, and so taking up the maximum amount of heat as the same was given off from the cells. Mr. Campbell gave particulars of the results obtained at a number of refuse destroying works, and at the conclusion of his paper a lengthy discussion took place.

**New Companies.****Clifton Drive (St. Anne's-on-Sea) Land and Building Co., Limited.**

This company was registered on May 9th by Pitman and Sons, of 14, Clements Lane, London, E.C., with a capital of £10,000 in £5 shares. The object of the company is to acquire certain leasehold property in Clifton Drive, St. Anne's-on-Sea, Lancashire, to enter into an agreement with Thomas Marsden, Harwood Robinson, Joseph Nightingale, John Forrest, Frank Oldham, John Morris, William Ward, Henry Worthington, and John Sudall, and to carry on the business of builders, contractors, builders' merchants, &c. The first directors (to number not less than three or more than seven) are to be nominated by the subscribers. Qualification, £250. Remuneration as the company may decide.

**Measures Brothers (1899), Limited.**

This firm was registered on May 5th by A. E. Warner and Co., of 10, Finsbury Circus, London, E.C., with a capital of £285,000 in £1 shares. Object, to acquire the business carried on at 57, Southwark Street, S.E., by Measures Brothers, Limited, to enter into an agreement with Measures Brothers, Limited, R. J. Measures, R. H. Measures, R. T. Measures, and H. T. J. Measures, and to carry on the business of ironmasters and contractors, smelters, fitters, &c.; to acquire any mines, mining and other rights, metalliferous lands, alluvial ground, &c., in any part of the world, and to carry on the business of a mining company in all its branches; to develop the resources of land by clearing, &c.; as stock raisers, &c.; to establish gasworks, telegraph and telephone systems; as bankers, company promoters, stock and share dealers, builders and contractors; to acquire and turn to account any patents, patent rights and inventions, real and personal property, &c. The first subscribers (each with one share) are:—R. J. Measures, R. H. Measures, R. T. Measures, H. T. J. Measures, W. W. Measures, J. Barrow, and H. E. Warner. The number of directors is to be not less than three nor more than seven;

A Statue of Mr. Kruger, ordered by Transvaal patriots from Aberdeen contractors, has been despatched to Pretoria. It is upwards of 60ft. in height, and the granite base covers over 40 square yards. A colossal bronze of the President will surmount the structure.

the first are the first four subscribers. Qualification, £5,000. Remuneration as fixed by the company or by agreement.

#### Horsfall Destructor Company, Limited.

This company has been registered with a capital of £100,000 in £1 shares, to acquire the business carried on by the Horsfall Furnace Syndicate Limited, to enter into an agreement with the said syndicate, to erect and maintain furnaces, machinery, and apparatus for the destruction of town and other refuse, to construct, maintain, and work any machinery or plant for the generation or distribution of electricity, and to carry on the business of electrical and mechanical engineers, machine makers, boiler-makers, iron and brass foundries, millwrights, iron and steel converters, &c. The subscribers are:—Mr. Arthur Greenwood, 16, Great George Street, Westminster; Mr. G. Watson, 21, Springfield Mount, Leeds; Mr. C. E. A. F. S. Butler, 4, Princes Mansions, Victoria Street, S.W.; Mr. F. L. Watson, 21, Springfield Mount, Leeds; Mr. W. Hillman, 7, Tolson Street, Leeds; Mr. C. F. Dent, 5, St. John's Terrace, Leeds; and Mr. J. Williams, 38, Springfield Place, Leeds. The number of directors is not to be less than three nor more than seven. The first are—Arthur Greenwood, Philip A. V. Robinson, Arthur P. James, George H. Denison, Major Morgan Lindsay, and George Watson; qualification, 500 shares; remuneration, £700 per annum divisible.

#### South Beckenham Land Company, Limited.

This company was registered on May 10th, with a capital of £20,000 in £5 shares, to enter into an agreement with Ivor Price, to purchase and traffic in land, and house and other property, and to carry on the business of builders, contractors, decorators, merchants, dealers in stone, sand, lime, bricks, timber, and hardware, house agents, brick, tile, and terra-cotta makers, &c. The first subscribers (each with one share) are: Eustace M. Ford, 82, Bedford Circus, solicitor; E. J. W. Lowell, 30, Bedford Row, W.C., clerk; John Cox, Public Hall, Beckenham, architect; Francis Sandford, 33, Hertford Street, W., gentleman; Ivor S. Price, 201, Piccadilly, W., gentleman; John Newman, Effingham House, Arundel Street, W.C., clerk; Harry Pierce, 62, Carter Lane, E.C., clerk. The first directors (to number not less than three, nor more than seven) are to be nominated by the subscribers. Qualification £100. Remuneration £100 each per annum.

#### WOOD-BLOCK PAVING. (MR. WHITE'S SYSTEM.)

For Churches, Schools, Offices, &c.  
Estimates and full particulars on application to  
**THOS. GREGORY & CO.,**  
WOOD PAVING AND STEAM  
JOINERY WORKS,  
Clapham Junction, S.W.

#### South Derbyshire Land and Building Company, Limited.

This company was registered on May 8th, with a capital of £10,000 in £10 shares, to acquire any lands and prepare the same for building purposes, and to carry on the business of builders, contractors, decorators, dealers in stone, sand, lime, bricks, timber, hardware, and other building materials, brick, tile, and terra-cotta makers, house agents, &c. The first subscribers (each with one share) are:—H. Trafford Nadin, 20, Ashby Road, Burton-on-Trent, colliery owner; H. G. Nadin, Stapenhill, Burton-on-Trent, colliery owner; William Hay, Stanton, Burton-on-Trent, colliery manager; Tom P. Hewitt, Castle Gresley, Burton-on-Trent, colliery manager; R. R. Lishman, Bretby, Burton-on-Trent, colliery manager; Alfred H. Timmis, Swadlincote, near Burton-on-Trent, solicitor; Mrs. William Hay, Stanton, Burton-on-Trent. The first directors (to number not less than three or more than five) are:—Henry G. Nadin, H. Trafford Nadin, William Hay, and Tom P. Hewitt. Qualification, £100. Remuneration, as the company may decide. Registered office, Stevens Chambers, Market Place, Swadlincote.

# CARBOLINEUM AVENARIUS

(REGISTERED).

## PATENT WOOD PRESERVATIVE.

**CARBOLINEUM AVENARIUS**, the well-known Wood Preservative, enters the wood by its own action, and does not require a costly plant and machinery like other Wood Preservatives.

**CARBOLINEUM AVENARIUS** entirely prevents dampness in brick and stone walls, also wet and dry rot in timber above or below ground, and is used by all the leading Railway Companies, and by Builders, Brewers, Contractors, Estate Agents, Mine Owners, &c., &c., in the United Kingdom.

**CARBOLINEUM AVENARIUS**, the most successful preservative and antiseptic for Wood Paving Blocks. Used in the Metropolis and many Provincial Towns. Superior to Creosote or Hard Wood.

For further Particulars and Testimonials, apply

PETERS, BARTSCH & CO., DERBY, and 68, Queen St., Cheapside, London.

## To All Owners and Users of Steam Boilers.

PATENT 22,561, ACCEPTED FEBRUARY 9TH, 1895.

### ABSOLUTE PREVENTION OF BOILER INCRUSTATION.

By addition of Chrome Salts to the Feed Water the formation or deposit of all Incrustation is thoroughly prevented.

For Cost of Licenses and Full Particulars, apply

PETERS, BARTSCH & CO., DERBY, and 68, Queen Street, London.

## INDESTRUCTIBLE COMBINATION WASHERS,

FOR FLANGE JOINTS OF STEAM AND WATER PIPES.

Tested up to 2300lb. Pressure

These Washers consist of Rings of Soft Metal, grooved outside, and holding in the groove packing material such as Asbestos, Rubber, Hemp, &c., &c. The soft metal, in conjunction with the packing included, will accommodate itself readily to any unevenness in unplaned flanges, and make a perfect and durable joint. It is impossible, owing to their construction, to blow them out under any pressure whatever.

PETERS, BARTSCH & CO., DERBY.

London Office: 68, QUEEN STREET, CHEAPSIDE, E.C.

## CONTRACTS OPEN.

### TRICHINOPOLY WATER WORKS EXTENSION.

The Sanitary Engineer to the Government of Madras is prepared to receive TENDERS for the supply of (1) Pipes and specials, (2) Fittings for the above works. About 762 tons of pipes and specials are required.

2. Specifications, schedules, tender forms, and drawings can be obtained of the undersigned.

3. Sealed tenders, endorsed "Tenders for pipes, &c., for Trichinopoly Water Works Extension," must be delivered at the Office of the undersigned not later than WEDNESDAY, JUNE 7th next.

4. The successful tenderers will be required to enter into a contract and deposit a security for the due performance of the terms of specification.

5. Tenders will be sent by the undersigned to Madras for disposal, and the result will be intimated by wire shortly after date of receipt there of the tenders.

6. The Sanitary Engineer does not bind himself to accept the lowest or any tender.

HENRY S. KING and Co.

65, Cornhill, London,  
May 16th, 1899.

### COUNTY BOROUGH of WOLVERHAMPTON. PUBLIC BATHS.

The Parks and Baths Committee of the Corporation of Wolverhampton invite TENDERS for the SUPPLY, ERECTION, and FIXING of a FEED-WATER SOFTENER in the Public Baths, situate in Bath-place, Wolverhampton.

Specification and Form of Tender may be obtained on application at the offices of the undersigned.

Sealed Tenders, endorsed "Tender for Water Softener," and addressed to the Chairman of the Parks and Baths Committee, must be delivered at the

Town Clerk's Office not later than TEN o'clock a.m. on JUNE 17th, 1899.

The Contractor will be required to enter into an undertaking to pay not less than the minimum standard rate of wages of the district, and to observe certain hours of labour in accordance with the resolution of the Town Council.

The lowest or any Tender will not necessarily be accepted.

J. W. BRADLEY, A.M.Inst.C.E., M.I.Mech.E.,  
Borough Engineer and Surveyor.

Town Hall,  
Wolverhampton,  
May, 1899.

### LEYTON URBAN DISTRICT COUNCIL. TO BUILDERS, CONTRACTORS, AND OTHERS.

The Leyton Urban District Council are desirous of receiving TENDERS for the CONSTRUCTION of CHIMNEY SHAFT at their Electric Light Station, about 156ft. in height and 8ft. in diameter.

Plans and specifications may be seen, and form of Tender and other particulars obtained of Mr. WILLIAM DAWSON, M.Inst.C.E., at the Offices of the Council, Town Hall, Leyton, between the hours of TEN and FOUR (Saturdays, TEN and TWELVE).

Sealed Tenders, in special endorsed envelope supplied with the forms, accompanied by a £10 Bank of England note, to be inclosed with the Tender (to be forfeited if the Tender is withdrawn before the contract is signed), must be delivered at the Offices of the Council, Town Hall, Leyton, before NOON on the JUNE 6th, 1899.

The Council does not bind itself to accept the lowest or any Tender.

R. VINCENT,  
Clerk to the Council.

Town Hall,  
Leyton,  
May 8th, 1899.

THE COMMERCIAL CABLE BUILDING,  
THE QUEEN'S INSURANCE BUILDING,  
... and ...  
THE R. G. DUNN BUILDING.

NON-FLAMMABLE WOOD has been tested by H.M. Admiralty, and large Orders have been given by H.M. Government.

Quotations on receipt of Requirements, Address, &c.

## THE BRITISH NON-FLAMMABLE WOOD COMPANY Limited,

2, Army and Navy Mansions, Victoria Street, London, S.W.

## WROUGHT IRON BEAMS.

WITH regard to wrought iron beams, it may be mentioned in the first place, that the weight required to break a 1" x 1" x 12" bar is 2250 lbs.; but for a flanged girder, another formula is required. This, according to Hurst, is  $W = C \frac{ad}{l}$ , and although it is much wiser to work by equating stress and bending moments, yet for simple cases the employment of this formula will suffice.

$W$  = breaking weight in tons in the middle.

$C$  = a constant found by experiment.

$a$  = area of bottom flange in square inches.

$d$  = depth in inches.

$l$  = span in feet.

Wrought iron girders, also, may be made in three forms, viz., rolled, plate, or box.  $C$ , the constant, differs slightly in each case.

VALUES OF  $C$ .

For rolled girders the value of  $C$  is 7.0

" plate do. do. " 6.0

" box do. do. " 6.5

$A$ , the area of the lower flange is a little more difficult of calculation than in the case of a cast iron girder. In the sketches, Fig. 1, the parts shaded show the portions to be calculated as the area of the lower flange. Of course, in the case of plate and box girders, the rivet-holes must be deducted.

Now the ultimate strength of wrought iron per square inch is usually taken under compression at 16 to 20 tons, and under tension at 20 to 25 tons. This gives working stresses of 4 tons compression and 5 tons tension. Thus, the working stresses under both conditions being so much alike, shows the reason why wrought iron girders are always made with both flanges the same size, especially as the shanks of rivets may be included in the area of flanges under compression, while rivet-holes must be deducted from tensional flanges.

One or two examples of the application of the formula will now be given:—

What distributed load will a 10" x 5" rolled iron joist safely carry over a 12ft. span?

In a question of this sort the thickness of the flanges must be assumed. In a girder 10" deep, a fair thickness for the web would be  $\frac{3}{8}$ ", and for the flanges  $\frac{1}{2}$ ".

$$W = C \frac{ad}{l}$$

$A = 5" \times \frac{1}{2}" = 2.5$  sq. in.  $C$  for rolled girders is 7.0.

$$\text{Then } W = 7 \frac{2.5 \times 10}{12} = \frac{175}{12} = 14.58 \text{ tons.}$$

This being a concentrated load, then  $14.58 \times 2 = 29.16$  tons distributed load. This being the breaking weight, taking 5 as a factor of safety, the answer is  $29.16 \div 5 = 5.83$  tons.

Here is the form of the question reversed, taken from one actually set: A rolled iron joist, 7" deep, is required to carry the joists of a single floor, 20ft. span, over an 8ft. window opening. Taking the total load on the floor at 2cwts. per foot super., determine the section of the joist.

In the first place, it is necessary to find the total weight carried by the girder.

Area of floor supported by girder = 8ft. x 10ft. (half-span of joists) and weight =  $8 \times 10 \times 2 = 160$  cwts., or 8 tons distributed load.

8 tons distributed = 4 tons, concentrated safe load.

Taking 4 as a factor of safety =  $4 \times 4$ , or 16 tons, breaking weight in the centre.

$$\text{By the formula } W = C \frac{ad}{l}; 16 = 7 \frac{a \cdot 7}{8};$$

$$16 = \frac{49a}{8}; 49a = 16 \times 8;$$

$$A = \frac{16 \times 8}{49} = \frac{128}{49} = 2.61 \text{ sq. in.}$$

This would give a  $\frac{1}{2}$ " flange just over 5" wide. From this the section of the joist could easily be drawn.

It will be observed that these formulae are worked out very much on the lines of those applying to cast iron girders. To conclude, a more elaborate example will be given:

Required, the size of a wrought iron box girder, to carry an 18" wall, 12ft. high, over a 20ft. opening.

Firstly, as usual, find the weight on the girder.

$20 \times 12 \times 1.5 = 360$  cube feet at brickwork. This may fairly be reckoned at 10wt. per cube foot. A total weight of 18 tons is thus arrived at.

18 tons distributed = 9 tons concentrated; and, with 4 as a factor of safety, gives a breaking weight of 36 tons.

$$\text{Then } 36 = C \frac{a \cdot d}{l}$$

$C$  in a box girder is 6.5

Assuming the depth to be 18"

$$\text{Then } 36 = 6.5 \frac{a \cdot 18}{20}$$

$$36 \times 20 = 6.5 \times a \times 18$$

$$a = \frac{36 \times 20}{6.5 \times 18} = \frac{40}{6.5} = 6.15 \text{ sq. in., area of bottom flange}$$

To carry an 18" wall, the flanges must at least be 15" wide.

Assume a 15" x  $\frac{3}{8}$ " plate and angle irons 3" x 3" x  $\frac{3}{8}$ ". As rivet holes must be deducted, let the rivets be  $\frac{3}{8}$ " diam.

Then  $a$  would be

Plate  $15" - 2 \times \frac{3}{8}"$  (two rivet holes) x  $\frac{3}{8}" =$

$(15" - 1\frac{1}{2}") \times \frac{3}{8}" = 13.5 \times .375 = 5.06$  sq. in.

Angle irons  $(3" + 3") - (2" \times \frac{3}{8}") \times \frac{3}{8}" = (6" - 1\frac{1}{2}")$

$\times \frac{3}{8}" = 4.5 \times .375 = 1.68$

$5.06$  (plate) +  $1.68$  (angle irons) =  $6.74$  sq. in.

This is scarcely strong enough, and as in this class of question, it is always well to

FIG. 1.

15in.

FIG. 2.

work the calculations out to a nicety, the amount of metal in the angle irons must be increased a little.

If they be made  $\frac{1}{2}$ " thick, then

$$\text{Angle irons } (3" + 3") - (2" \times \frac{3}{8}") \times \frac{1}{2}" = 4.5" \times .5 = 2.25"$$

And  $4.06$  (plate) +  $2.25$  (angle irons) =  $6.31$  sq. in., which is slightly in excess of the required  $6.15$  sq. in.

It is well to bear in mind, however, that neither cast nor wrought iron are much used now for girders. Cast iron is unreliable, and has so been acknowledged for many years, while steel can now be produced so cheaply and has so many advantages over wrought iron as to have almost entirely taken its place for structural work, rolled iron being difficult to obtain.

The formulae given in these articles are only applicable to the simple cases of single centre or uniformly distributed loads. More complex cases of unevenly placed loads are of common occurrence, and in such cases resource must be had to the system of equation of moments or to the use of the stress diagram.

NOTE.—In calculating the area of the flange, Hurst says include one-sixth the area of the web, but as the difference made is so extremely small, this has been intentionally omitted in the text.

A Technical School for Barrow is to be erected from plans by Messrs. Woodhouse and Willoughby at a cost of about £15,000. The building will be of a very handsome character.

## Engineering Notes.

**Extension of Waterworks.**—A scheme, which will provide for the erection of two new reservoirs, one at Little Denny and the other at Earlsburn, at a cost of £43,500, has been passed by the Falkirk and Larbert Water Trust.

**The New Isolation Hospital, Aldershot,** is being warmed and ventilated by means of Shorland's patent Manchester stoves, with ornamental tiled sides and with descending smoke flues, supplied by Messrs. E. H. Shorland and Brother, of Manchester.

**Tramways in the Potteries.**—Electricity on the overhead system has superseded steam as the motive power for tramcars throughout the Staffordshire Potteries. The exchange has cost approximately £80,000, and when the extensions now in progress are completed the mileage will be one of the most extensive, if not the largest, owned by any private company.

**Proposed Graving Dock at Belfast.**—A deputation from the Belfast Harbour Commissioners waited on Mr. Goschen last week to ask for the construction of a graving dock of sufficiently large dimensions to enable Belfast to construct warships of the first-class. The First Lord of the Admiralty replied that however much Her Majesty's Government might desire to grant the request, he could not hold out to the commissioners any prospect for the near future.

## Masters and Men.

**Leeds French Polishers** have obtained an advance of  $\frac{1}{2}$ d. per hour. This brings the standard rate up to 8d. per hour.

**Formation of a Painters' Union at Perth.**—At a meeting of Perth painters the advisability of forming a branch of the Scottish Amalgamation in Perth was considered. After some discussion it was decided to take the necessary steps for the formation of a branch.

**A Meeting of Edinburgh Plumbers** was held last week, when it was ascertained that about 380 men were on strike. It was anticipated that a favourable reply would be received from the Master Plumbers' Association, as twenty-two masters have already signed the new bye-laws and granted the increase of wages. The men are anxious to settle the matter by arbitration, but the masters will not accept any of the gentlemen suggested as arbiters.

**State of Trade Abroad.**—In New Zealand the building and engineering trades have been busy, and all workmen fully employed.—A satisfactory state of affairs prevails in the Transvaal, the number of unemployed having considerably decreased.—A strike of 3000 building trade operatives took place at Carlsbad, in Austria, which lasted over a week, and is said to have been due to the proposed introduction of new working rules by the employers. A settlement was obtained by the employers and workpeople agreeing to draw up a new set of rules conjointly.

**Edinburgh and Leith Joiners' Strike.**—A meeting of the joiners on strike was held in Edinburgh last week. It was resolved that in view of misunderstandings regarding the by-laws, a copy should be issued to masters, and that, on their signing the same, their workman would be allowed to resume work. The signing of the bye-laws meant that the agreement would remain in force for a year, and that the rate of wages for that period would be 9 $\frac{1}{2}$ d. per hour. At a previous meeting it was resolved that none of the men be allowed to resume work until the Masters' Association had signed the bye-laws conceding the increase of wages. Seven masters have signed the new by-laws.

# THE DISPUTE IN THE BUILDING TRADE.

THE trouble in the Building Trade is practically at an end. There will be no general lock-out, such as has been looked forward to, and it is to be hoped that the conference, which has been arranged, will result in a happy ending of all the trouble.

In Sheffield the building trade has been in a very satisfactory condition, and it was hoped that the dispute would not be taken part in in that city; but unfortunately for their hopes the Sheffield Association of Master Builders decided to follow in the steps of other Yorkshire firms and lock out 25 per cent. of the men. It was feared that a large number of the small firms, who are financed by property owners, would not fall in with the movement, but they have agreed to do so. The number of men employed in the building trade in Sheffield is about 1,000.

The position of the masters at Hull at the

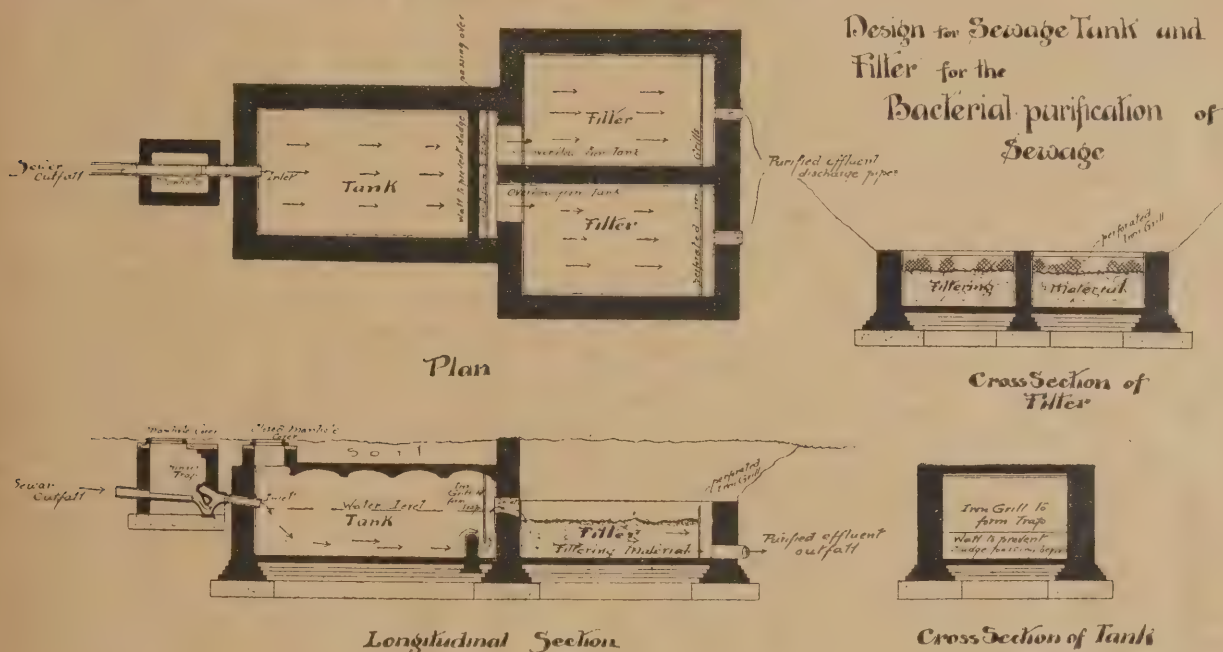

for a building where society men were employed has led to the temporary abandonment of a contract. The men are trying to overcome this "boycott" by smuggling sand into the city, and the fact that twenty-three plasterers with eleven labourers are still engaged, is satisfactory to them.

A conference of the representatives of practically the whole of the trades unions in the building trade of the United Kingdom was held in Manchester at the beginning of last week. Over 230,000 operatives were represented. A resolution was passed condemning in the strongest possible terms the "untrue and misleading" statements contained in the manifesto issued by the Yorkshire Master Builders' Federation. The meeting further expressed the opinion that the points raised by the master builders are not of sufficient importance to justify a lock-out in the building trades, and that they were prepared to meet the National Association of Master Builders in open conference.

At a meeting of the executive of the Yorkshire Master Builders' Association, held on Tuesday, last week, a reference was made to

left to local committees of employers and workmen, who will settle the question in each district. On the vexed question of demarcation, it is recommended that a committee of employers and workmen in equal numbers should settle the question whenever it arises. Each union affected is to have an equal number of representatives on these committees, so that if, for instance, the bricklayers and the plasterers are affected, each would have three representatives to the employers' six.

The vexed question of the employment of non-unionists is, perhaps, the greatest difficulty to contend with in coming to a basis of settlement. The plasterers resolutely refuse to pledge themselves to work harmously with non-unionists. The settlement on this is somewhat on the lines of Rule 10 of 1896. There is to be no stoppage of work until six days have elapsed after a written notice from the workmen has been sent to the employers as to the matter in dispute. But in no case are workmen to be bound to continue at work for any employer who pays any man in his employ less than the standard rate of wages of the district. All

BY ALBERT C. FREEMAN.

beginning of last week was weak. A report was made by the men's organisation of an application by a member of the Masters' Federation for thirty men, bricklayers, joiners, and labourers, to commence work. The men looked upon this as a very important secession. Later on in the week the masters employed several non-union men, and anticipated being strong enough to hold out until the end.

The Halifax masters are now all in the Federation. One by one districts in which the lock-out has been delayed are falling into line with the general body. A well-attended meeting of the members of the Cardiff Master Builders' Association received a communication from the Operative Stone Masons' Society stating their willingness to meet their committee to discuss the various matters in dispute, with a view to settlement. It was decided to fix a date for this purpose.

Leicester builders have been able to treat the dispute with equanimity, as they have been able to obtain good plasterers from Dublin and other parts of Ireland.

The example set by the plasterers at Leeds is likely to be followed by the bricklayers. They fully recognise that if they compete with the masters and obtain sufficient jobs to keep them going they can hold out indefinitely. The only way by which the masters can prevent this is by stopping supplies of materials. That this has been done is apparent from the fact that the originators of the co-operative scheme have had some difficulty in obtaining sand; and inability to procure pressed bricks

the conference of trade union representatives at Manchester. An emphatic denial was given to the assertion that the manifesto of the Yorkshire Federation was "untrue and misleading."

A representative meeting of the master builders of North Staffordshire, held last week, decided unanimously not to lock out the trades' unionists in the district who supported the plasterers' dispute, as they considered such a course was unnecessary and unjust. In their opinion the dispute could be settled by arbitration.

The result of the important meeting of master builders in Birmingham last Thursday was that a resolution was passed agreeing to receive favourably any proposal for a conference, with the view of an amicable adjustment of all matters in dispute, and that such a conference should be held before the end of this month. The decision of the Standing Committee of the National Association of Master Builders to accept the proposals of the Plasterers' Union, brings matters to a very satisfactory condition. These proposals practically amount to a return to the status quo which existed before the present lock-out of plasterers began, and the new working rules will be very similar (should they be accepted) to those which were agreed to on July 1, 1896. The employers offer to accept the assurance as shown by the last vote of the members of the Plasterers' Union, that there is no desire to force managing foremen to take up a union ticket. The question of apprentices will be

contractors are also bound to pay the rate of wages current in the district.

As we have before remarked this settlement might have been arrived at long ago. Nothing has been gained by prolonging the dispute. The men go back to work practically as they came out.

## NEW SEWAGE TANK AND FILTER.

THE design by Mr. Albert C. Freeman, here reproduced, for a sewage tank and filter bed for the bacterial purification of sewage, illustrates a method of horizontal filtration. The sewage enters a manhole and passes through a "Winner trap" into the sewage tank, and at the end of the tank is constructed a dwarf wall to prevent paper and sludge passing beyond into the trap. The height of this wall would be arranged as thought fit to suit the required arrangement. Behind the wall is an open space divided with an iron screen which forms a trap. After passing the screen, the sewage flows horizontally through the filter beds, and, having passed to the end of the filtering material, runs through the outlets at the end of the tank which are placed at the bottom. The filtering material is kept clear from the purified effluent outfalls by means of perforated iron screens, thus leaving the outlets perfectly clear and in no way obstructed.

## Builders' Notes.

**Large Consignment of Jarrah Wood.**—The Adèle has arrived in London with about 750 loads of Jarrahdale Jarrah on board to the order of the Jarrahdale Jarrah Forests and Railways, Limited, 1, Fenchurch Avenue, London, E.C.

**New Buildings Made from Old.**—James Tozer was summoned, at a special sitting of the Southend Borough Bench, last week, for erecting a building of combustible material and not sending in plans. It was mutually agreed that the "building" was a wooden shed in the back garden which had been there six years, but a few months ago Mr. Tozer bodily moved it a yard or two. Thereupon it became a new building. Defendant was fined 10s. and 12s. 6d. costs. After this conviction the corporation have power to pull the building down.

**A Mistake in a Tender.**—At a recent meeting of the members of the Gloucester School Board tenders were received for the erection of a new school. The lowest tender, that of Messrs. Gurney Bros., for £8,700, which was £5,676 below the highest tender sent in, was accepted. After the acceptance of this tender a communication was received from Messrs. Gurney Bros. to the effect that they had made an error in their estimate, and asked to be allowed to send in an amended tender. The Board did not think such a course would be fair, and accepted the next lowest tender—that of Messrs. John Gurney and Sons, of Gloucester, for £11,548.

**Aberdeen Building Trades' Federation.**—The fourth annual report states that the year just closed has been one of the most uneventful the organisation has ever experienced. An effort had been made to induce two trades which had never been connected with the Federation, viz. the masons and plasterers, to join, the result of which was that the plasterers had affiliated with them, but the masons declined to do so, and there appeared very little probability of their becoming part of the Federation so long as the existing arrangements between their Union and the employers continued. During the year two conferences of building trade workers had been held under the auspices of the Federation. The first one went off very satisfactorily. At the second, the question of Federation was fully dealt with. A variety of views were expressed as to what was the best form of Federation, and while some would be content with nothing short of an ideal scheme, others were prepared to accept any form, however feeble, so long as a beginning was made with what all agreed was desirable.

**Liabilities of Builders and Contractors.**—A case was heard at the Aberdeen Sheriff Court by Sheriff Burnett, in which James Leask, slater, of Magdalen Place, Aberdeen, sued Robert Mitchell, builder, of 3, Elmfield Place, Aberdeen, for £19 2s. 8d., the balance due for slating work done by him on a house at West Cults, which the defendant had built for a Mrs. Davidson. The plaintiff alleged that he tendered for the work on plans and measurements submitted by defendant; that the plans submitted were not the true plans of the house, and the measurements were greatly understated; that he was not bound by his offer to do the work for a lump sum, but was entitled to be paid at contract rates for the work actually done. The defendant pleaded that in making the contract he was acting only as Mrs. Davidson's servant, and was therefore not liable; that plaintiff had contracted to do the whole slating work of the house for a lump sum; that the contract had not been completed, and that, taking into account the cost of completing the work, nothing was due to plaintiff. The sheriff found that the plaintiff duly performed the work set forth in the account sued for, and that the charges made in the account were fair and reasonable; that the work was per-

formed by the plaintiff on the employment and instructions of the defendant; that in employing and instructing the plaintiff to perform the work the defendant did not name a third party as the person to be responsible for payment of the same. The defendant was the person responsible for such payment, and he, therefore, ordered him to pay the amount claimed, with costs.

**A Smoke Nuisance Prosecution.**—At Dewsbury last week Messrs. Howroyd and Oldroyd, Drysalters, of Fall Lane, were charged with permitting the issue of smoke from the chimney of their works, so as to be a nuisance. It was denied that black smoke had been emitted, and the firm declared that waste logwood and other dyewoods had been mixed with the coal, the result being that the smoke was grey and not of the colour described. The Bench thought otherwise, and made an order for an abatement within three months.

**Worcester Improvements.**—A special meeting of the Hop Market Guardians was held last week to receive the recommendations of the joint committee of the Guardians of the City Council, with reference to the widening of the Foregate by setting back the Hop Market Hotel. The Guardians had already agreed to set the hotel back 8ft. on receipt of £3,000 from the Council, and the joint committee now recommended that an additional 62 square yards be sold to the Council for £4,250, which will give a width of 42ft. to the roadway, on condition that the Council undertake to acquire what further property is necessary to provide a width of 42ft., the whole length of the Foregate, within five years of their obtaining a provisional order for compulsory purchase. The Guardians agreed to this recommendation, and at a special meeting of the City Council subsequently held, the Council also unanimously agreed to the terms of the recommendation.

### Are Altered Buildings New Buildings?

—At Thorpe Police Court, last week, Edward Charles Ward, a lawyer's clerk, residing in London, was summoned for committing a breach of the Clacton Urban District Council's bye-laws, by not providing sufficient air space at the rear of new buildings, of which he was the owner. Mr. Glen, for the Urban Council, explained that defendant was the owner of two dwelling houses at the corner of Rosemary Road, Clacton. In 1897 defendant proposed to make some alterations, and submitted plans to the council, which were not approved by that body as the buildings would encroach too far upon the roadway. In February 1898 fresh plans were deposited, and these being satisfactory were passed. The plans showed that a proper air space, 20ft. had been allowed at the back of the buildings. In December, last year, the local authority found that the proper air space had not been allowed, and the defendant was given notice of this discovery. Defendant replied by stating that the provisions in the bye-laws as to air space only applied to new houses, and therefore did not affect his works, which were in connection with old buildings. The question then arose whether these works constituted an addition to an old building, or whether they converted the whole into a new building. Mr. Glen contended that the alterations had made them into new buildings within the meaning of the bye-laws. Mr. Pritchard, for the defendant, argued that the premises in question were not new buildings, but merely consisted of additions to old buildings, which were erected before the District Council was constituted; therefore, he said, the authority's bye-laws did not affect the premises. He pointed out that in all the correspondence on the subject, the Council's officers referred to the premises as "alterations and additions." The Bench retired to consider their decision, and on returning to the court, the chairman announced that they had come to the conclusion that the premises in question were new buildings, and that a breach of the bye-laws had been committed by the defendant, who was fined 20s. and costs.

## Surveying and Sanitary Notes.

**Newcastle's Street Improvement Expenses.**—The annual report of the City Engineer (Mr. W. G. Laws) for Newcastle was issued recently. The report states the Town Improvement Committee is 'underspent by' £514, to which must be added a credit amount of monies received for flushing drains, &c., £84; leaving a total credit balance of £598. From this has to be deducted items not carried out, as follows:—Alterations of De Grey Street, £420; making the total £178. So that everything included, the result of the year's work is a small margin of £178 not spent. The expenditure of the Sanitary Committee has also been fairly close to the estimates, or £551 underspent, on paper; but from this there fails to be deducted unexecuted items to the amount of £601, thus leaving a net excess of £50 over the estimated cost of the work actually done. This difference being scarcely more than 0.1 per cent. on the gross estimate, needs no special explanation. The amount paid out of the rates for the repair and maintenance of streets and highways came to a total of £24,372; the macadam roads cost £11,650.

**A Road-making Case.**—The objections to the making of the Heathfield Road at Hayward's Heath were heard by Major Borrer and other magistrates recently at the Hayward's Heath Petty Sessions. It seems that the initial difficulty was whether the road could be considered a street within the meaning of the Act. The rapid rise of new buildings enabled counsel to state that it was a street. In making the plans and specifications a great deal of work was found to be required to form a road out of a very rough track. The Urban Council decided upon granite as the material, and debated the question of paved or unpaved paths, the majority being in favour of the kerbed path only. The rise of wages demanded in the local labour market had added to the estimated cost, and at the hearing Mr. Prince, for the Council, said that the estimated cost of making, sewerage, and kerbing and channelling the road was £1,412. The point raised by the objectors was that the estimated expenses were excessive. Particular stress was laid on the fact that the use of flints instead of granite would save £135. The magistrates retired to consider the case, and on their return the Chairman said they agreed to the plans and specifications, but with regard to the apportionments they would amend them, so that the difference between the cost of granite and flints, about £135, should be deducted from the £1,412, and paid for out of the rates. The balance should be primarily borne by the frontagers, but those frontagers who had made provision for their drainage should be required to pay one-half, and the remainder charged to the rates, and, similarly, the proportionment of those owners whose properties had frontages to other roads should be reduced one-half, and the balance charged to the rates.

**Alleged Extravagance at Southend.**—At a special sitting of the Southend Borough Bench, last week, before Mr. G. F. Jones (in the chair), and Messrs. H. Wood and C. Woosnam, several owners, in Osborne and Windsor roads respectively, objected to the specification and apportionment of the Corporation in respect to the making up of those roads, alleging that the Council's requirements were unreasonable and extravagant. The requirements of the Town Council were that the owners should pay for a new sewer, artificial stone paving, granite kerbing, and the expense of the lighting plant.—Mr. Powell, for the objectors, said there was already a sewer in the street; no question of lighting was mentioned in the notice (so that it could not be charged), and asphalt and brick channelling (about half the cost of the other) were all that was necessary in this side street. Mr. Snow, for the Corporation, replied that the existing sewer

was defective, but under all the circumstances the corporation would not press their claim for the expense of the laying of a new one. Since the borough had been incorporated the corporation had been saddled with an expense of £800, because some of the streets which had been taken over were not properly channelled. He urged that there was no need to enumerate all the works (such as lighting) in the notice. —Mr. Fidler, the borough surveyor, considered that the Local Government Board would readily allow a loan for twenty years if artificial stone paving was used, but only for ten years if asphalt. —Alderman Ingram and other owners thought the requirements of the Town Council unreasonable in these side streets. —The court decided that the expenses of the sewer and the provision and means of lighting, and all expenses connected therewith, should be eliminated from the apportionment; but they held that the provision of artificial stone and granite kerbing and channelling was reasonable, and the cost not excessive.

**Market Drayton Sewage Scheme.**—A Local Government Board inquiry into an application by the Rural District Council for power to borrow £2,400, for sewerage and sewage disposal works was held last week. There was no opposition.

**Newcastle-under-Lyme Sewerage.**—There was no opposition at the Local Government Board inquiry with reference to an application by the Town Council, for power to borrow £865 for new sewerage works in Keele Road. It was explained that the new works were required in consequence of the opening up of a district known as Pool Fields. The length of sewer would be 1110yds.

**The Gold Medal of the Surveyor's Institution,** given to the winner of the highest place in the Fellowship examinations, has this year been awarded to Mr. Sydney Arthur

Smith. Mr. Smith was also the winner of the Pentfold Silver Medal and the Driver prize at the Professional Associates' Examination in 1897. He has, therefore, gained unusual distinction in his course through the various stages to full membership. He is at present engaged with Messrs. Weatherall and Green, surveyors and auctioneers, 22, Chancery Lane, having served his articles with Mr. Thornton, Westminster, and also had experience in the office of Messrs. Ernest George and Yeates.

**Liverpool Improvements.**—Mr. Vigers, arbitrator, who sat recently at Liverpool to determine the amount to be paid by the Corporation to the Mersey Dock Board, as the purchase price of the site of George's Dock, has delivered his award. The dock is to be acquired for an extensive scheme of city improvement. It will be filled up, and the site utilised for new streets, &c., the Dock Board reserving a portion for their new pile of offices. Mr. Vigers awards total £305,224.

Property and Land Sales.

LOCAL SALE of PLOTS on MAY 31st.—ILFORD.—Uphall Estate, First Portion.—Free conveyances; payment by instalments: roads made; tithe and land tax free.—The special attention of Plot Buyers, Builders, and Creators of Ground-rents is directed to the sale of this Land, which is ripe for immediate building.—ONE HUNDRED and THIRTY-NINE PLOTS of ripe FREEHOLD BUILDING LAND, having frontages to the following thoroughfares, viz., Ilford-lane (a road 50ft. wide, leading from Ilford Broadway to Barking), Wingate-road, Natal-road, and Uphall-road. The plots vary in frontage from 16ft. to 37ft., and in depth from 90ft. to 125ft., and are ripe for the erection of small houses and shops, and the immediate creation of ground-rents.

MESSRS. DOUGLAS YOUNG and CO. will SELL the Above by AUCTION at the Angel Hotel, High-road, Ilford, on WEDNESDAY, MAY 31st, 1899, at SEVEN o'clock in the evening. Particulars and conditions of sale may be obtained at the Mart, E.C.; of the Solicitor, J. HOWARD SMITH, Esq., 7, Finsbury-circus, E.C.; or of the AUCTIONEER, 51, Coleman-street, E.C., Clapham and Ilford.

LAND SALE in a MARQUEE on the ESTATE on THURSDAY JUNE 8th.

CLAPHAM PARK.—An unequalled opportunity for securing FREEHOLD VILLA SITES, so rarely to be obtained in this neighbourhood. About half a mile from Clapham-road Railway Station and the City Electric at Clapham Cross, and the Cable Tramway, Brixton-road; and close to the lovely Commons of Clapham and Tooting Bec. Free conveyances; payments by instalments.

LINCOLN HOUSE ESTATE.—TWENTY-EIGHT choice FREEHOLD SITES in Clarence-road and Poynders-road, each having a frontage of 60ft. and an average depth of 340ft., secluded from the road by a beautiful belt of shrubs and trees.

SIXTY PLOTS of BUILDING LAND, with frontages of 30ft.; depths varying from 125ft. to 165ft. Situate in Rodenhurst-road, a new thoroughfare, 50ft. wide, leading from Poynders-road to Elms-road and Clapham Common.

MESSRS. DOUGLAS YOUNG and CO. will SELL the above by AUCTION in a Marquee on the Estate, on THURSDAY, JUNE 8th, 1899.—Particulars and conditions of sale may be obtained of the Solicitors, Messrs. PHELPS, SEDGWICK, and BIDDLE, 22, Aldermanbury; Messrs. LINKLATER and Co., 2, Bond-cour, Walbrook, E.C.; JOHN ANNAN, EDWARD DEXTER, Joint Managers, United Realisation Co., 32, Old Jewry, E.C.; or of the AUCTIONEERS, 51, Coleman-street, E.C.; 213, Clapham-road, S.W.; and Ilford, E.

FLEET STREET, CITY.—By order of the Governors of St. Bartholomew's Hospital.—A fine commanding Building Site, occupying an area of about 2342 sq. ft. on the south side and newly widened part of this great main thoroughfare, within about 40 yards of Ludgate-circus, having frontages of about 55ft. 6in. to Fleet-street and 51ft. 5in. to St. Bride's-avenue in the rear (facing St. Bride's Church); remarkably well lighted back and front, and suitable for the erection of first-class shops and business premises—a bank, newspaper or publishing offices, or other important buildings adapted to the position.

MESSRS. DEBENHAM, TEWSON, FARMER, and BRIDGEWATER are instructed to LET by AUCTION, at the MART, on TUESDAY, JUNE 13th, at TWO, on a Building Lease, for a term of 80 years direct from the Freeholders, the very compact and valuable SITE of Nos. 90, 91, and 92, Fleet-street, at 2 and 3, St. Bride's-avenue, in the City of London.

Particulars, with plans, of Messrs. WILDE, MOORE, and WIGSTON, Solicitors, 21, College-hill, Cannon-street; of Messrs. E. F'ANSON and SON, Architects and Surveyors, 7A, Laurence Pountney-hill, E.C.; at the Clerk's Office, St. Bartholomew's Hospital; and of the AUCTIONEERS, 80, Cheapside.

# BLIZZARD IN AMERICA.

## COPY OF TESTIMONIAL. (Unsolicited).

FRANK MILES DAY AND BROTHER  
ARCHITECTS  
925 CHESTNUT STREET, PHILADA.  
F. M. DAY H. KENT DAY

March 1, 1899.

Mr. George Wragge,  
Salford,  
Manchester, England.

Dear Sir:

Noting your full page advertisement in the "Specification" this morning reminds us that we have been intending for some time to write to you to tell you how admirably your casements in Mr. Newbold's house behaved during the recent blizzard. The storm was one of unprecedented severity, the snow being thirty inches on a level and it was accompanied by winds of great velocity. The snow being very fine and dry, found its way in generally through the slightest cranny. The blizzard was promptly followed by a rapid thaw that set everything afloat and caused quite serious damage through leaks. The conditions were probably the most trying that we remember during the course of our practice. Your casement frames perfectly resisted every force of that storm and the subsequent thaw. No snow whatever entered Mr. Newbold's house either through the doors or windows, nor did any water get in when the thaw came.

This, we think, shows not only the excellence of the goods of your manufacture but the fact that they were well installed by the men under our direction. We are glad to be able to write you this, not only on our own account, but because the Owner of the house particularly wished us to express to you his satisfaction with your work.

Yours very truly,

*Frank Miles Day & Bro.*

The above *UNSOLICITED* Testimonial refers to a very important order for upwards of 250 BRONZE CASEMENTS supplied to Mr. Newbold's Mansion, Philada. U.S.A. The sections used were Nos. 20, 22 and 24, illustrated in our NEW CATALOGUE, pages Nos. 10, 14 and 18 respectively.

## An Architectural Causerie.

### A Lesson from Sir W. Richmond's Failure.

THE recent outcry over the "desecration" of St.

Paul's brings home to us in a very forcible manner the absence of, and the need for, an English School of Decoration. Had such a school been in existence these doings would have been impossible. It is to be hoped that those in whose custody our public monuments are placed, will learn from this fiasco the lesson that a painter, however eminent as a painter—even though he be Academician, professor, and knight—is not necessarily a decorator, and is not the proper person to whom independent control should be given over such a scheme as this. It is needless to point out how little decoration is understood, or how little study is given to the subject. The Royal Exchange is being "decorated," that is to say, certain pictures of historical subjects, to a large scale, are being placed upon its walls by certain eminent painters. One cannot, therefore, altogether blame the Chapter of St. Paul's for not understanding the principles of decoration, and for not knowing where to turn for advice and assistance. Why, then, have we no school? and why is the subject not studied and taught at the Royal Academy, the Slade, and elsewhere? The R.A. gives a prize, but it does not teach. Fortunately there is now growing up a genuine love and appreciation of pure decoration, and many of our younger men are individually doing good work, but there is not yet any general consensus of opinion and sympathy, sufficient to make itself heard on matters of public interest. The decoration of such buildings as St. Paul's is one of those things that are best left undone; the only excuse for doing it, is to do it superlatively well; to do it badly, or even indifferently, is unpardonable. Enough has, perhaps, been said on the demerits of the present scheme; it seems to have evoked an unanimous chorus of condemnation. There must be many of us, however, who, much as we condemn it, have hitherto held our peace out of respect for the artist's genuine reputation, and because there is no need to hit a man when he is down. His painful letter to the "Times," however, will, it is to be feared, alienate the sympathy of many who had a certain pity for a man in a false position, and who would wish to deal tenderly with a brother artist. But it has now become a distinct issue between the interests of St. Paul's and the interests of an individual painter; indeed, we might say, between the interests of art and those of one particular

artist, and we have now no choice left to us. It has already been said that these decorations are bad, it only remains to be said that they must come down, and that at once. The painter appeals to the judgment of posterity. Is this quite fair to posterity? We—not posterity—have allowed this thing to be done, it is for us to undertake the thankless and unpleasant task of setting it right; and from another point of view—are we willing that this work should be handed down as an example of our knowledge and taste? The latter part of the century has sins enough on its conscience, many curious things for which to answer at the bar of history—Shaftesbury Avenue, the Tower Bridge, St. Alban's Abbey. But while most of the things we do are necessary things, the fault being that we do them badly, these "decorations" are quite unnecessary, and a perfectly gratuitous insult to the memory of a great man. A contemporary has complained that the artist has been treated as an ignoramus and an apprentice. What chance, one may ask, has anyone to become other than an apprentice at work of this description? Where can one get the practice that makes the perfect

from Petersfield to Bishop's Waltham, by way of Meon Stoke, at which last-named place the other branched off for Alresford; but these proposed railways were never put in hand. The present scheme is for a route by way of Wickham, following the south-eastern border of Waltham Chase, and continuing by way of Soberton, and near Drox-ford to Meon Stoke, whence it proceeds through Warnford and West Meon and between the remote villages of East and West Meon, to its junction with the existing Alton and Winchester branch at Alton station. The line will be laid in double track, and is intended to form an express route to Portsmouth. Two short tunnels and some heavy earthworks will be necessary, and it was in the excavations in progress for these that the fatal accident, in which several navvies were entombed, occurred two months ago. An unwelcome feature of this undertaking will be the cutting up of the picturesque village of Wickham into two portions. Wickham was the birthplace, in the early years of the fourteenth century, of that great churchman and statesman of Mediæval England, William of Wykeham, the cele-

THE VILLAGE OF WICKHAM. DRAWN BY C. G. HARPER.

artist? The most accomplished painter is but an apprentice, when he starts at decoration and the employment of mosaics, and cannot approach his work in too humble a frame of mind. The present disaster is sufficiently accounted for by the colossal self assurance, verging on insanity, which distinguishes the letter to the "Times." Such utterances as this provoke the question—where is the Society for Checking the Abuses of Public Advertising? A. R. J.

### The Ruin of a Picturesque Village.

A NEW branch railway in Hampshire, planned by the London and South Western Railway, has been authorised by Parliament, and is now under construction. Some twenty miles in length, it will begin at Fareham, in the neighbourhood of Portsmouth, and will run to Alton, chiefly along the valley of the little brook known as the River Meon. The Meonware county—as this district of Hampshire is called—has always lacked railway facilities, and many years ago the South Western made surveys for two branch lines to supply this want. One was to run

brated Bishop of Winchester. After the fashion of the times, he took his name from the place of his birth, but the name of his parents is said to have been Long. They were quite humble peasants, and it is therefore not surprising to learn that all trace of his birthplace has vanished, although local traditions still point out the site. The old parish church has been largely remodelled. The view of the village given here shows its lower part, and the large building to the left hand is Wickham Mill, a structure commonplace enough on the outside, but interesting within, as the floorings and joists are made from the pitch pine timbers of the American frigate *Chesapeake*, captured by H.M.S. *Shannon*, after a desperate fight, in the British-American War of over eighty years ago. Shot holes are readily to be seen in these timbers, and even now a bullet is occasionally found. The railway will quite spoil this view, coming, as it will, on a high embankment across the road. The houses seen here between the mill and the church, stand directly in the course of the new line, and will have to come down. Thus, solely for the sake of modern commercial uses, one of the prettiest villages in Hampshire will be spoiled C. G. H.

## On Reflection.

**"For this Relief  
Much Thanks."**

THE protesters have not protested in vain. An announcement was made last week which will be received with satisfaction by all—or nearly all—who admire the masterpiece of Sir Christopher Wren, and who do not wish to see it mutilated. The Decoration Committee of St. Paul's decided at their last meeting that the stencilling should be removed. No one—not even its author—has had a good word for the stencilling, and most of us agree with Lady Colin Campbell that it is "unutterably indefensible," though we might not all express ourselves just in that way. The committee have further agreed "that the panels in the fourth quarter dome shall not be proceeded with until the committee have seen the effect of the whole of the south-west section being so treated." We are pleased to see that the committee are manifesting a more reasonable spirit than at one time seemed likely, and we sympathise with Canon Scott Holland's suggestion that they shall be left for a while in peace to sift and weigh the protests they have received. These are not lacking in variety and suggestiveness, and probably there is very little left to say that has not already been said. We would suggest that for the present, therefore, the most reasonable attitude will be one of hopeful expectancy. The protests have been justified by the degree of success they have already obtained. We hope the committee will now act so wisely and sanely that it will not be necessary to renew them. Meanwhile our readers will be interested in the reproduction of Wren's design for the decorations which we present as a supplement with this week's issue.

### An Architectural Exhibition.

THE April number of the American "Architectural Review" contains a lengthy and well-illustrated account of an exhibition recently held by the New York Architectural League. A perusal of these pages suggests the inquiry why such an exhibition is not held in London. It is a commonplace lament that in England the average man cares very little about architecture, which he regards as the least important of all the arts. Yet how should it be otherwise, when architects themselves take so little pains to demonstrate the dignity of their calling? Why, for instance, have they not long ago revolted against the ignominious position accorded to their exhibits at the Royal Academy exhibitions? More than sixty years ago there was incorporated by Royal Charter an Institution—to wit, the Royal Institute of British Architects—"for the general advancement of civil architecture, and for promoting and facilitating the acquirement of the knowledge of the various arts and sciences connected therewith." It would be difficult to devise a more effective means of attaining those objects than the holding of an annual exhibition similar to that of the New York Architectural League. This exhibition included, in addition to architectural drawings, examples of sculpture, glass work, wall papers, iron and bronze work, pottery, embossed leather, &c. A similar exhibition in London, if organised on a broad and popular basis, could hardly fail to prove interesting and attractive to a large section of the general public as well as to members of the profession. It is possible that from the mere pounds-shillings-and-pence point of view, such an exhibition might not prove an immediate success; but it would be a fine object lesson to the general public, and would do more than many papers and speeches to raise Architecture from the ignoble position it at present occupies in this country. After

all, the R.I.B.A. is not merely a Mutual Improvement Society; *usui civium, decori urbium* is its motto. As the representative architectural institution in Great Britain, it has a duty to the public as well as to its own members.

### Fire Geography.

THE British Fire Prevention Committee, to whose useful work we have often had occasion to refer, has recently called attention to an important but little known aspect of the subject of fire prevention, viz., what may be described as "Fire Geography." In the insurance world, this special aspect of the subject is carefully studied, and maps are prepared showing the extent and characteristics of the conflagrations as they occur; but, hitherto, architects and engineers have paid but little attention to these matters. A recent publication of the committee, entitled "Conflagrations during the Last Ten Years," should do much to demonstrate to the architect, builder, and engineer the close relationship that exists between their work and the safety or otherwise of a locality in the event of an outbreak of fire. By means of twenty-three coloured maps, which have been carefully reproduced by lithography, the author, Mr. Charles E. Goad, explains in a graphic way the conditions upon which the character and extent of a conflagration depend. In speaking of the great Cripple-gate fire of November, 1897, the author points out the large number of confined spaces covered by one-story buildings with glass skylights for roofs, which existed in the area covered by the fire. When fire reached one of these light courts it was impossible for human beings to enter, and the fire had free play to attack from five to twenty buildings in the rear without any hindrance whatever. It is satisfactory to know that in the rebuilding of this area considerable improvements have been made in the structure of the houses, though it is a pity that the streets could not have been widened, for it goes without saying that the risk of a fire assuming alarming proportions is far higher in these congested districts. The author adds the ominous warning that there are many similar hazardous centres in London, and that sooner or later we may expect serious trouble in connection with them. In a similar way Mr. Goad deals with most of the greatest fires of the past ten years in all parts of the world, drawing from each hints, suggestions, or warnings, which ought to prove both interesting and instructive to all architects and builders, especially to those whose practice lies chiefly in large cities.

### A Contractor's Dilemma.

AN extraordinary state of affairs has just been revealed by a prosecution instituted by the St. James' Vestry against Messrs. Waring, the contractors for the new Carlton Hotel in Pall Mall. In fitting up the sanitary arrangements of the hotel, Messrs. Waring put nine soil pipes inside the building instead of outside, as the bye-laws of the London County Council require. The vestry, as the authority charged with the duty of enforcing the bye-laws, had no option but to prosecute, though they seem to have done so in a rather perfunctory spirit. They did not wish to compel the contractors to alter the position of the drains—a matter which would necessitate the structure being half pulled down—and suggested that the case would be met by a fine. The magistrate pointed out that if he imposed a fine, the vestry might keep on summoning the defendants as long as the offence continued. The vestry seem to have given an undertaking that they would not do this, and Mr. de Rutzen accordingly fined the defendants £2, and allowed £10 10s. costs. On the face of it this looks very like a scandalous

disregard, on the part of both magistrate and vestry, of the laws it is their duty to enforce. But before we pour out our indignation on Mr. de Rutzen and the St. James' vestry it is well to look at the other side of the question. It is not contended that the sanitary arrangements at the Carleton Hotel are in any way defective; indeed, the surveyor to the vestry has declared that they are the finest he has ever seen, and are capable of standing any test that could be applied, so that, at the worst, nothing more than a technical breach of the bye-laws was committed. Moreover in this case the contractors had to carry out their work subject to two conflicting authorities. The hotel, it seems, is built on Crown land, and the Crown surveyor, on behalf of the Office of Woods and Forests, forbade the soil pipes in question to be placed outside the building, on the ground that they would deface it; yet the County Council requires that all soil pipes shall, in the interests of the public health, be taken outside the building. If the unfortunate contractor, placed, so to speak, "between the devil and the deep sea," chooses to obey the Crown surveyor, and thereby infringe the bye-law, it seems hardly fair that he should be subjected to accumulating penalties for doing so. Such, evidently, was the view taken by the vestry, and their prosecution—futile and ridiculous as it appears—will not be wholly useless if it serves to direct attention to the unsatisfactory character of some of the L.C.C. bye-laws. The Council themselves, we believe, have recognised the need for the revision of this particular regulation, and in their new bye-laws now awaiting the sanction of the Local Government Board, the qualification "whenever practicable" has been added to the requirement that soil pipes shall be placed outside buildings. It is to be hoped, therefore, that not many more contractors will be placed in the unpleasant predicament lately occupied by Messrs. Waring.

## OUR COMPETITION.

INTENDING competitors are reminded that the last day for sending in designs is **Wednesday next, June 7th.** It may be presumed that most of our readers who intend to submit designs have by this time almost, if not quite, completed them. But for the benefit of any who may not yet have done so, we repeat our announcement that full details as to the conditions of the competition, in which premiums amounting to **Thirty-four Guineas** are offered for the three best designs, appear on p. 200 of the BUILDERS' JOURNAL AND ARCHITECTURAL RECORD, dated May 10th.

Up to the time of going to press we have received intimations from 113 readers of their intention to submit designs. A considerable number have already sent in their designs, and we take this opportunity of acknowledging the receipt of designs, specifications and sealed envelopes bearing the following mottoes: Albion, Alfio, Appliqué, Clerk of Works (2 sets), Clodhopper, Cypress, Endeavour, Firefly, Gradatim, Hospice, Joss, Muff, Red Rose, Rustic, Sou' Wester, Yew, Young Will.

Designs have also been received (unaccompanied by specifications or sealed envelopes) from Dulce Domum and Nineteenth Century (2 sets). Designs with the sealed envelope but without separate specifications have been received from Star and Othniel; the latter only sends two plans with the envelope. In these cases the specifications may be contained in the envelopes. We mention these details so that any competitor who has inadvertently omitted to send part of what is required by the conditions may rectify the error before it is too late.

## SWEDISH COUNTRY HOUSES.

By R. KEITH JOHNSTON.

UNTIL comparatively recent times all houses in Sweden were built of wood, that material being naturally chosen in a country which to-day produces timber in such quantities that nearly the whole of the woodwork used in English houses—window sashes, doors, window frames, and all such items as joists, rafters, and floor boards are imported from across the North Sea. So great, however, has been the devastation by fire in places where there were many buildings close together, that the use of wood is now prohibited in the towns, where stone, brick, or other incombustible material must be employed.

To English ears a "wooden" house seems to indicate a very unsubstantial concern, which, apart from the danger of fire, could not withstand the effects of more than a very limited number of winters. In our climate a building of this material would not, probably, last many generations; the dampness of the atmosphere and the frequent and sudden changes would quickly deteriorate the timber, and the house would soon begin to go to pieces.

In Sweden, however, they are blessed with a climate which, though the cold in winter is far more severe than ever experienced in England (even when we can hold a fair on the Thames), is very much drier and more constant, and there they know how to build a house of wood which will live through many more seasons than some of our "Substantial Villa Residences." Indeed, the house named Anfaströd is well over one hundred years old,

ANFASTRÖD: A WOODEN HOUSE OVER 100 YEARS OLD.

at the season of the year most convenient for each, in such quantities that the larder will hold out until the time for preserving comes round again. The "hard-bread," made from rye-flour, found in every Swedish house, from that of the humblest "Torpare" (who pays his rent by a certain number of days' labour, instead of in money), to that of King Oscar, is baked only five or six times in the year, and must be stored in a dry place or it soon becomes unpalatable, so that good cellars are a *sine quâ non* in that country, and are worth all the pains bestowed upon their building.

The foundations vary in thickness according to the size of the house, and are made perpendicular on the outside, so that no snow or water can lie on them, and sloping on the inside until the top course is reached. This is not less than 2ft. thick, it being impossible to build a wall of rough stones narrower than that.

Immediately on the top of the foundations a wooden "sill" is laid, and on this the walls are built up. These are composed of logs, or rather tree stems, roughly flattened with the axe on two sides only, the other two sides being left in the natural shape as indicated in the sketch (Fig. 1). The logs thus formed are generally about 6in. thick between the flattened sides, the thickness between the rounded sides tapering gradually, as the tree grew, from about 9in. at the thick end.

In the oldest houses the logs were notched at about a foot from each end, on both of the rounded sides, in such a way that when the house was built up the whole structure was very firmly built together, the ends of the logs projecting, so that, when viewed from above, the external walls would look like a picture frame of the "Oxford" pattern (see Fig. 1).

The projecting ends added very considerably to the strength of the building, but, possibly because they were looked upon as unsightly, or perhaps because it is found that ample strength is attained by a simple dove-tail joint, the more modern houses are put together rather differently, as Fig. 2 will show, the notches being cut at the extreme ends of the logs, so as to leave a "dove-tail" projecting.

When the house is built up in this fashion the corners do not cross, but have a flush finish, the ends of the logs being apparent in the form of "dove-tails." This form of construction is as strong as could be desired, as each "tail" is held in place by the logs immediately above and below it in the wall at right angles with itself, while it in turn is the retainer of the upper and lower edges respectively of the logs which control it.

The logs, as shown in the sketches, are placed with their flattened sides towards the outside and inside of the walls, the rounded edges being at top and bottom, and as they are not of uniform thickness, the broad and narrow ends are alternated. The different

"courses" of the walls are prevented from warping and becoming displaced by means of wooden pegs, driven right through two logs and into a third, as indicated by the dotted lines in figs. 1 and 2.

It will be noticed that the joints between the logs on one side of the house do not coincide with those in the walls at right angles, but alternate with them, this "bonding," to use a mason's term, being effected by joining the thin end in one wall to the thick end in that at right angles with it. In the places where doors or windows are to come, the ends of the logs are reduced to about one third or one half of their thickness, and are let into a groove of corresponding width in a log placed vertically, so as to keep the logs forming the walls in position laterally. This vertical piece, however, is not the full length of the height of the opening, a clear inch being left at either end to allow for the vertical shrinking of the walls.

Skanskullen, a modern villa, in the town of Uddevalla, is an example of a wooden house in a fashion very different from the older "log" house. As the accompanying sketches indicate, there is, first of all, a stone foundation, showing great variations in height, as the house is built on a very uneven rock. On this comes a frame-work of uprights, and there are outer and inner linings of boards nailed to the uprights, the space between the two walls being packed with sawdust. In other respects the

FIG. 1.

and I have been informed by an eminent Gothenburg architect that wooden buildings known to be so much as three, and even four, hundred years old are still in existence.

In order to prevent the lower timbers from rotting, which they would very quickly do if in contact with the ground, the building must be raised from the surface, and placed upon a less perishable foundation. This must be, at any rate to the height of 2ft. above the surface, of stone. Brick is sometimes used for the next 2ft. or so (the timber usually beginning at about 4ft. above the earth), but brick being very porous, and absorbing moisture freely, would be destroyed by the frost of the first winter, if used quite close to the ground.

Even stone must be used in a particular manner if the foundation walls are intended (as is the general custom), to form dry cellars, for if one stone is of such length that it comes right through from the outside to the inside, the frost will penetrate through that stone, and, coming in contact with the warmer air within, will produce a "constant supply" of moisture in the cellar.

The foundations in a good house are now usually laid in hydraulic cement, the interior being lined with the same material, thus forming cool, dry, and rat-proof storehouses for the large stock of dried provisions kept, especially in localities far removed from shops, by the prudent Swedish housewives. These stores include large sausages of many kinds, smoked salmon, salted herring, tongues, preserved fruits of all sorts, and many other delicacies for the table, which are prepared

FIG. 2.

house is built as are other wooden residences, and it is now some ten or twelve years old, and is in every way satisfactory, the walls, apparently so unsubstantial, being found all that could be desired for warmth and comfort. Many other houses are now built in this manner.

The joists to support the floors are built into notches cut for them as the walls are erected, for their ends project right through the walls, and are often continued so as to form the support of the verandahs, which are always to be found on such a house as that we are considering.

The rafters to support the roof are put on very much as in an English house, except that as they have to support a roof first of boards, then of asphalt-paper, or felt, and finally of

tiles, they are more substantial than with us, and to give additional strength, as well as the better to shield the walls from snow and rain, the joists of the upper or attic floor are very frequently prolonged three or four feet beyond the walls, and the rafters are extended so as to rest on them as well as on the tops of the walls, see Fig. 3.

Such projections of joist and rafter ends are usually carved into gargoyles, griffins, dragons,

FIG. 3.

and other monstrosities, which add greatly to the picturesque appearance of the house.

The interstices between the logs are packed with dried moss or oakum, driven in with a tool and mallet as in caulking a ship, so that the walls are made quite weathertight, but in case any little chink should be left open, the walls are covered on the inside with a coarse sort of paper-board—much like what we call “mill-board”—about  $\frac{1}{16}$  in. thick. This is fastened on with clout nails, and it serves as a smooth surface on which to paste the wallpaper, as well as an additional safeguard against imperfect caulking of the walls.

The exterior is first covered with asphalt-paper or tarred felt, over which boards  $\frac{1}{4}$  in. thick are nailed.

These boards are usually placed vertically,

FIG. 4.

3 in. or 4 in. apart, the spaces between being covered by other boards 7 in. or so in width, so that there is no chance of rain penetrating through the joints; the sketch Fig. 4 will give some idea of the outer covering when fixed in this manner. In other cases, however, the boards are placed close together, the joints being covered with a narrow ornamental beading.

(To be concluded.)

**The New Jamaica Bridge, Glasgow,** was opened last Wednesday by Lady Richmond.

**A Memorial to Five Welshmen** has been erected at Llansannan, Denbighshire, and was unveiled last week. The celebrities commemorated are: Tudur Aled, a poet and Franciscan monk of the fifteenth century; William Salisbury, the translator of the New Testament into Welsh in the sixteenth century; Jorwerth Glan, a poet-preacher of the present century; the Rev. Henry Lees, the Keble of Welsh Methodism, and his brother, Dr. William Rees, Congregational minister, author of the greatest Welsh epic and the pioneer of Welsh journalism. The memorial is a life-size bronze figure of a country maiden in the national costume, and wearing a wreath as a tribute to those commemorated. The figure, designed and executed by Mr. Goscombe John, is seated on a plinth, the supporting obelisk at the back bearing the names of those commemorated.

## THE PUBLIC AND ARCHITECTURE.\*

By C. ERNEST MONRO.

IN considering this subject the first thought that enters one's mind resolves itself into the question: “How does the great British public regard Architecture?” Unfortunately this may be summed up in two words—complete indifference.

The average man when charged with his indifference endeavours to excuse himself by saying: “There is no architecture worth looking at,” and one hastens to give the obvious reply: “There is certainly architecture worth looking at, and on you, as one of an ungrateful public, this beautiful architecture is wasted.” Of course, one is perfectly aware that that which Dogberry, in “Much Ado about Nothing,” was so anxious should be written in regard to himself, holds equally good in regard to the public. The public in the architect's mind is “an ass” undoubtedly, but I will try in the following remarks to ascertain what causes this indifference of the man in the street, and how his asinine propensities may be lessened if not entirely got rid of.

Architects, and especially aspiring architects, are too prone to consider the opinion of the public as of no account, and yet how often one finds that, in his criticism of a plan, the outsider will place his finger on certain grave mistakes, which have been overlooked even by that most fault-finding of critics—the architectural brother. The average man's opinion as to what constitutes architecture is distinctly vague, and varies from a rather low conception of it, to ideas quite above even the so-called artistic architect's high-flown notions. To some it suggests a hod of bricks, drains, Buchanan's traps, and “all that sort of thing, you know,” this opinion being invariably accompanied by way of emphasis, by the point of the nose being slightly elevated; and as an example of the very loose way in which the word is sometimes used, I, myself, have been asked, and by a house-factor, too, to examine and see if there would be any “architectural difficulties” in the proposed erection of a certain w.c.!

But perhaps the most common error is the idea that unless a building be covered with ornament, it is not architectural; that an ordinary building is one thing, and an architectural building, a superior article altogether. They cannot understand that a common tenement may be architectural, and that a building covered with bad and misplaced ornament is decidedly *not* architectural; in short, that a “but and a ben” may be quite as architectural, in its own way, as a lordly cathedral. It is this ignorance as to what constitutes architecture that is the principal reason for the indifference of the public, and it is this ignorance that causes their criticisms to be passed unheeded.

After mentioning in this brief way the main ideas in regard to the public (as a whole) and architecture, I would particularise a little now, and examine the relation between the public, as represented by municipal authorities, building committees, &c., and architecture. Here one immediately falls foul of municipal authorities in regard to their Building Acts and bye-laws. Drawn up frequently by an official or an unpractical draughtsman, they do about as much evil as good; and when expounded in the newer light of the most recently appointed and consequential of inspectors, these bye-laws become quite frequently nonsensical, and may be driven through by the proverbial coach and four. Even when framed carefully and by better men, such Acts will never teach an architect his business; they will only cast reflections on his ability and reliability, and at the best merely serve to keep the jerry builder within certain bounds.

That municipal authorities have strange ways of dealing with art is well known; but

will you let me give you an example of this, which I recently read about. A fine, large, stained-glass window in a certain town hall had got broken, and the estimate for repairs, according to the invariable rule, came to too much. To reduce this, one council member suggested litho glass, which brought the sarcastic rejoinder, “Why not try rags?” After some discussion the following amendment was proposed and carried:—“That the matter stand over until the holes get bigger!” Comment is useless, one can only gasp at such consummate folly. That the average committeeman is hopeless, architects who have come into contact with him are well aware, but when he is burdened with the additional responsibility and care of the ratepayers' money, he becomes quite obstreperous. “I object,” he loudly asserts, “to have my responsibility as a member of this council placed on the shoulders of an architect; the better way for us is to use our own common-sense, and, as we have to pay the piper, it is only fair that we should call the tune, by selecting the design ourselves, quite independent of the advice of the architect, who,” he declares, “being a specialist and an expert, is a dangerous man to follow.”

That universal dissatisfaction prevails amongst architects, in regard to competitions, is not much to be wondered at, when we consider how often the assessor's decisions are ruthlessly overturned by the use of what the bumptious councillor calls “his own common-

SKANSKULLEN: DINING-ROOM CEILING OF WOOD MOULDINGS IN HIGH RELIEF.

sense.” These, then, are the class of people who adjudicate on the plans for the building of what should be some of our finest examples of architecture. They either use their so-called common-sense, or take the advice of an incompetent and possibly interested assessor, and the result is that the man in the street, having only bad architecture before him, will never grow wise, and the young architectural genius, with the soft hat and the green necktie, as he passes along the street only stops to ejaculate, “Who did that?” while an expression of disgust, engendered by his superior knowledge, appears on his asthetic countenance.

Speaking of knowledge leads one to mention an example of that time-worn maxim, “That a little knowledge is a dangerous thing.” The little knowledge which the public have got hold of in this case, is what they call “style.” They will insist that every building is built in a certain style, and if their architectural friend cannot tell them to which style a certain building conforms, he is put down, through no fault of his own, as a fellow who doesn't know his business. The architect who cannot unblushingly say, to satisfy their inordinate thirst for knowledge, that such and such a tenement is built in the Early Florentine Renaissance, or tenth century Gothic is thought little of.

That a so-called style is the outcome of centuries of growth, and the development of the ideas, not of one man, but of a great number, they cannot understand, and will calmly ask you to invent a new style specially for them, as they would like this new butcher's shop, which they intend to open, to have a good advertisement, and this new style would serve to draw the customers from the rival shop across the way. This commercial profit-making spirit is indeed much to blame for the evil days on which architecture has fallen. It shows itself in the keen cutting that is done by contractors for a building, and in the parsimonious way in which our best buildings, or what should be our best buildings, are treated.

Let me now consider the relationship

\* A paper read before the Glasgow and West of Scotland Technical College Architectural Craftsmen's Society.

SKANSKULLEN, UDDEVALLA.

between the architect and that more particular part of the public, namely, the client. What vision of beneficence he appears to the budding architect, that first client of his, and how he delights to tell his friends of what a client of his once said or did. Alas, this ere long becomes a tale of woe, for the ideal client, who is a joy for ever, has not yet appeared. To work for him at first is really quite an honour, but after a while the balance seems on the other side, and the client's many vagaries become nauseous. To begin with, he has very vague ideas as to the sort of house he wants, while you have very strong ideas as to the sort of house he ought to have. He will insist on having a design that is really bad, and will not accept one that is "not half bad." He has no imagination, is always commercial, has a notion that you adopted the profession by way of amusement, and considers that an architect is a useless luxury. "What's the good of my having an architect to plan my drains for me," he will say; "the sanitary authorities are paid to look after them, and even if they don't do it as well as the architect, it will cost me less, anyway. The Master of Works will soon tell me my walls are not thick enough, the joists too narrow, or the damp course (what-ever that is) not put in. No, I don't need an architect, a builder will do all I want," and he builder does it all, more or less, with the usual results, one of the smallest being that he extras amount to several times what the architect's fees would have been.

Take another of the forms in which a client appears. His first idea is that he wants a really good thing. The drawings are prepared, schedules issued, filled up, and returned, and then the disillusion commences. He always begins with a palace and ends with a hen-house, and the worst feature of the whole business is that the architect has to expend a very considerable time and no little skill in the reduction of the estimates, with the only and inevitable result, the reduction of his own fees. Should he charge, then the client feels he has a grievance in having to pay percentage on work which was not done, and he is never backward in telling you so.

The main idea of the average client is to get his money's worth, quantity rather than refinement, and as a result he gets either plain barn-door architecture or a job fussy and overloaded with so-called ornament, the whole being treated in what one might call the "public-house" style.

That this is the fault of the architect occasionally is true, but there is no denying the fact, that if the average architect desires to earn his bread and butter, or even his bread without the butter, he must follow out his client's wishes very rigorously, with very grave regard to the dimensions of his bank-book, endeavouring to lead him in a right direction, but yet remembering that he is

paid, not that he may carry out some fancy ideas of his own, at his client's expense, but, that his employer may have the house, or factory, which he believes most suitable for himself. The client must get rid of the profit-making spirit, which is the ruin of artistic taste; or should his income place him above this, then he should try not to act like the Yankee millionaire, who, in instructing the artist as to the painting of his daughter's portrait, told him to sling on plenty of paint as money was no object.

It is in his want of capacity as a business man, that an architect so often fails, and so causes his clients' mistrust, especially in financial matters. He has to be both an artist and a business man—two hardly compatible things—but yet it seems to be the practical and business-like man who forces his way to the front, and becomes the really successful architect; for the public, taking the most sensible view of the matter, have the idea that it is no use being able to design a really artistic gable if you cannot give instructions how to build it, or if the gable will not stand when built. But when one considers the enormous amount of knowledge expected of the modern architect, there is little cause for wonder if he be deficient in some of the numerous branches of his profession. He must have a knowledge of all the arts and all the sciences, and look at work from a tradesman's and craftsman's point of view; in short, be an artist, constructor, and engineer, and in addition to this, be a gentleman both in

feelings and manners, and have sufficient confidence in himself to enable him to act quickly and firmly in responsible positions.

That an architect should know about all the many branches which come under his supervision is necessary, but that he should give the drawings and instructions for each and all of these when they come as part of the work which he is carrying out, I am doubtful. If the building is one in which some special arrangement of a heating system is required, let him call in the heating engineer; if in sanitary matters, the sanitary engineer, and so on; then let him consult with each specialist and learn from him as a specialist, which system would be the best to adopt for the work he requires done, and in this way the science will be advanced, instead of retarded, as it so often is by the blundering of architects, who, having such a good conceit of themselves, believe they should do all. Life is far too short to learn a fraction of what the architect should be proficient in nowadays, and special subjects are better left in the hands of specialists, always provided that the architect intelligently supervises the work.

I am led to this remark by the experience which architects so often have when they propose to their clients to call in the aid of a specialist. But then the client expects far too much from the architect, complaining about things quite outside the professional control, and although the subjects may vary, yet the style of the letter altereth not: "Dear sir,—Please call here at once, as the rats have got into the kitchen, and we want to know how to get them out"; or "Dear sir,—The smell of paint in the house is something awful; please advise us what to do, as even our food tastes of oil and turpentine." But these are mild samples of what the architect—poor man—is subjected to.

When asked as to how the indifference of the public to architecture is to be got over, the answer is sometimes given, "Give good exhibitions of drawings of buildings, and the public will soon show more interest in them." This, in my small opinion, will be of little use. How much interest is taken in the architectural room in the average art exhibition? If a man wishes to see architecture it is not by looking at drawings, which are at the best only what the photo is to the subject, but he must learn to look around him as he walks down the street, for every street is in itself an architectural exhibition with both good and bad work in it, and practice will soon enable him to distinguish good from bad. As long as his study of architecture is confined to art exhibitions, or when on the hunt for a house to flit into, his indifference will not become lessened. Why should not the study of architecture be considered part of the education of a gentleman? Why should not the interest which even the holiday tripper shows

SKANSKULLEN, UDDEVALLA: IN PROCESS OF CONSTRUCTION.

SKANSKULLEN, UDDEVALLA.

in old buildings, be extended by him to our new buildings? Even although his interest in old buildings be chiefly in what has been called architectural freaks (I refer to leaning towers, crooked spires, haunted castles, and such like), and even although we do not build nowadays out of the plumb—that is to say, intentionally—yet I venture to say that in a walk along one of our own streets he would find plenty of architectural freaks to interest him, and far funnier ones than those of “Ye olden times.” Still, I am of the opinion that it is better to excite public attention by eccentricity than to let it slumber on in indifference.

But still there is one who requires improving quite as much as, nay more than, the man in the street, and that is the architect himself. To name only two professions, those of Medicine and Law, a candidate for these must pass stiff examinations after his heavy course of study, before he is allowed to practice. Why should the would-be architect not require to do likewise? The entry into the profession is far too easily made by the youth who considers he has a taste for drawing; and how can the standing of the architect be bettered when all those who, perhaps not physically, yet as regards their proposed life-work, are halt, maimed, and blind, are allowed, with no restrictions whatever and with few qualifications to begin their apprenticeship, blossom into so-called draughtsmen, and eventually begin business and help to swell the already large amateur element which renders our cities hideous.

Still we must be careful not to overdo this on the other hand, for cramming will not make an architect, and if a man is to be honoured by certain initials being added to his name, it were better, to my mind, that such should be given him as a result of good work carried out, rather than for book knowledge or designs for castles in the air.

That the public and the architect are less antagonistic than they used to be seems apparent, but yet there is room for further improvement. That the public are becoming more and more interested in art matters is obvious, and if this interest be conducted on the right lines, it will soon exhibit itself in architecture. That the lines are not always laid right may be judged from the following, which I recently read. “In a certain garden in the Forest Hill district of London the owner has placed a plaster cast of that celebrated piece of statuary, known as the Laocoon group.” The subject, you will recollect, is that of the father struggling with the snake for his two children. Regarded as a help to the beautifying of his house and garden, this was so far so good. Here, however, the man’s good intentions failed, for he endeavoured to further beautify the cast, by painting the legs of the father and

two sons, respectively blue and green, and obtained a most realistic serpent by the aid of black spots on a red ground! This is perhaps rather an extreme case, still it serves to illustrate the necessity of improvement on the right lines.

Better working between the contractor and the architect will help in the production of better work, and a continuation of the added interest which the craftsman takes in his work, will tend greatly to this desirable end. Another method which will help towards reviving architecture, and one which must come sooner or later, is the registration of architects. So much structural work and consequently the safety of the public, is now thrown on the architect’s shoulders, that it is imperative that he be thoroughly efficient, and registration will go far to effect this.

While much may be done by the interest of the private builder in the work which is being erected for him, yet more may be done by the intelligent interest of the citizen in the buildings of his city. If this interest were keenly felt, would, to give only one example, our great cathedrals be desecrated in the manner they so often are? We erect a building, and over the door inscribe the words, “To the

Glory of God,” and then use it for our own self-glorification, by placing on the floors or walls, tombs and monuments. If we must have our heroes glorified, why not have a building specially for the purpose, in which their great and good qualities might be emblazoned in gilt on marble and granite, and not have our cathedrals and churches spoiled by the insertion of busts, marble slabs, and such like into the walls, with no regard as to the suitability of the monument for the place, less for the good work ruthlessly broken to get them in, and, least of all, a thought as to the sanctity of the building.

If the architecture of the future is to show further improvement, it does not lie entirely with the architect to make that improvement. He must have an appreciative public to work for, an appreciation not born of ignorance, but of a taste for what is true and good; and even in this eminently practical age the true and good can surely be incorporated with actual needs.

If the attitude of the public to architecture is to be bettered, they must be taught how, why, and what to admire. Interest will follow, apathy disappear, and the outcome would be the production of better architecture, as an appreciative public would certainly stimulate the despairing architect to produce something both beautiful and useful, satisfying the public’s bodily wants, and not injuring their newly-found artistic susceptibilities.

As architects there is no use in being too reverent for the past, no use in building for the future, when conditions may have changed entirely; then let us build for the present, endeavouring to make it true and beautiful, and if it is the best that in us lies, then it will at least help towards the great end, the restoring of Architecture to its former and proper position as the “Mother of the Arts.”

**A Statue of the late Miss Frances E. Willard** is to be erected in Statuary Hall, Washington. This will be the first statue of a woman ever erected in Washington. The memorial will cost about £9,000.

**Welbeck Abbey was Struck by Lightning** last week; the whole of the lead work was ripped away from the turret clock, and many of the squares of glass in the windows of the grand dining-room were smashed.

**A New Post Office at Greenock** was opened on Whitsun Monday by Sir Thomas Sutherland, M.P. The plans for the new post office were prepared by Mr. W. W. Robertson, of Edinburgh, and the building is situate in Cathcart Street. It is built in Renaissance style, and has cost about £20,000.

## R. I. B. A.

### THE PLANNING AND CONSTRUCTION OF BOARD SCHOOLS.

BY T. J. BAILEY.

AN ordinary meeting of the Royal Institute of British Architects took place last Monday evening at 9, Conduit Street, Regent Street, London, W., with the president, Professor G. Aitchison, A.R.A., in the chair. It was announced that Mr. George Frederick Bodley, A.R.A., of 7, Gray's Inn Square, London, W.C., had been nominated for election as a Fellow of the Institute. The minutes of the last meeting were passed. The secretary announced with regret the death of Mr. Charles Bell, F.R.I.B.A., who was elected an Associate of the Institute in 1870, and a Fellow in 1880. A letter was read from Lord Reay, expressing his regret at being unable to attend the meeting to hear Mr. Bailey's paper. The letter also expressed the writer's high opinion of the author's ability to deal with the subject he had chosen. The president congratulated the members present attending for the first time since their election. Mr. T. J. Bailey then read his paper on "The Planning and Construction of Board Schools." Dealing first with

#### The Public Elementary School,

the author dwelt upon the need for careful selection of the site. An ideal site would be one of about two acres, rectangular, with the longest side as a street frontage, and having a western aspect streetwards. There should be proper provision of light and air, immunity from noise of traffic for classrooms, an open playground space of at least thirty superficial feet for each child, and of such a shape as to be available for games, such as football for the boys, tennis, &c., for the girls. In London and crowded districts where the ideal 30ft. minimum cannot be realised, the playground question is usually best solved by providing on the ground level for boys and infants, and putting a flat over the whole top of the building to form a playground for the girls; where sufficiently large, playgrounds should have a covered space, 50ft. or 60ft. by 18ft. with sides inclosed, open in front to the sun. Various desirable accessories to playgrounds, the most suitable paving, walls and railings, gates, the school-keeper's lodge, &c., were duly detailed by the author. Next treating of the buildings, the author described the three-storey school as being the most usual type. The infants are on the ground floor, the girls on the first floor, the boys above. The maximum size or accommodation of a group should not exceed 1548—in departments, boys 516, girls 516, infants 516—and if further accommodation is required, it should be provided by a separate mixed department. The hall, considered by the Board indispensable to every department, is a very good size at 54ft. by 30ft.; the classrooms, ten in number to each department, graduate from sixty to forty in accommodation. If possible, the main line of classrooms should face the playgrounds rather than a noisy road, and draw their light from the east, as that aspect suns up the rooms in the early morning and does not disturb them for the day. The hall, facing west, provides a good reservoir of sun-lighted air to help the classrooms, and is a cheerful place to march the classes into for recreative or collective purposes. Architecturally, this elevation, being the more broken up (comprising the main lighting of the hall, the staircases, cloak and teachers' room, and blocks and gable ends of wings), is more desirable for a street front than the long, unbroken line of classrooms. Two staircases for each senior department are required, and two entrances for the infants on the ground floor. The author then described in detail the plan of the building, the dimensions of the various rooms and staircases, the fittest materials for facing walls, and

for floors and staircases, the requisite fittings and the lavatory and sanitary arrangements.

#### Warming and Ventilation.

Touching warming and ventilation, the author glanced at the efforts towards improvement in these matters during the last twenty years. He commended as very good the system of low-pressure hot water pipes, pipes round the walls and just above the floor, where the desks are placed, and a few ventilating radiators bringing in warm fresh air; but, even with this system, an open fire in the room is needed, the brick flue simply connecting with the outer air not being sufficient for extraction. The author had tried trunks from the ceiling line of each room gathered into groups with a single outlet equal to the combined area of the group, and with a coil of hot pipes in the same to produce an upcast. This was effectual as far as ventilation was concerned, but could not be recommended for schools of more than one storey in height; in three-storey buildings it had the effect of conveying the sound from the rooms below to those above, and disturbing the classes. The greatest care should be taken to get continued purity of air, and with as little trouble as possible. The system known as the "Plenum" effected this in the only satisfactory way; it introduced fresh filtered air above the heads of the occupants of the rooms, warm in winter and cool in summer, diffused it over the area, and extracted it at the floor level on the same side as the inlet, carrying away with it all the unpleasant odours of damp and evil-smelling garments. This system has the further advantage that where closed and even double windows are necessary to exclude noise, there is always a quiet side from which the supply of air can be drawn, and the closed and double windows improve the working. The cost is not appreciably more than an ordinary hot-water installation, but the builder's work involved in the formation of ducts, flues, &c., is a rather costly item. In a section on

#### Furniture and Fittings,

the author dealt with the patterns of desks, and their arrangement in the various departments, the lighting, the seating accommodation, platforms, cupboards, and the adjuncts found essential for educational and recreative purposes. Interesting reference was made to an order issued by the Board to each of their schools requiring a plan of the departments to be prepared by the scholars under direction of the teacher, measured and drawn to a scale of an inch to 4ft., the furniture delineated, and the walls coloured in, and submitted to the architect for approval before being framed and hung up in the school. Some two or three hundred of these plans had been submitted to the author, and he had been much surprised and pleased at the high quality of the work. Few had been returned for revision, and some would have been no discredit to an architect's office. The Higher Grade Schools, of which there are forty-four in operation under the London School Board, are equipped with rooms for science teaching, in addition to those for art and manual work. They comprise chemical and physical laboratories, with balance-room and small dark room for experiments in photography, and a store for chemicals, also a demonstration and lecture-room. The buildings, fittings, and general arrangements of the Cassland Road School, Hackney, a typical example of the Higher Grade School, were shown in a series of detail drawings exhibited by the lecturer. A third division of the paper was devoted to Buildings for Special Instruction, comprising centres for domestic economy (cooking, laundry-work, and housewifery), manual training in wood, manual training in metal-work, swimming. The combination of subjects in the Domestic Economy Curriculum has led to the requirement of a building in each case capable of giving proper facilities for the teaching. A typical building, planned after consultation with the committee in charge of these subjects and the lady superintendent, consisted of a classroom on the ground floor, 22ft. by 18ft., seated for forty girls, a kitchen, sitting-room, scullery, and bedroom, with entrance lobby and staircase

leading to the laundry and cooking classrooms on the upper floor, the object being to provide instruction in general housework, as well as cooking and laundry work. Details were given of the requirements of the manual training centres for wood and metal-work. With the sanction of the Education Department, the Board have decided to establish three swimming baths in connection with the schools at Marlborough Street, Southwark, Hugh Myddleton, Finsbury, and Lyham Road, Brixton. Particulars were given of the proposed bath at Lyham Road. The building will be separate from the school, and have a distinct and separate entrance, with superintendent's office, &c. The swimming pool will be 50ft. by 20ft., 2ft. 9in. deep at one end and 5ft. 6in. at the other, lined with white glazed bricks, and having dressing boxes, spray baths, w.c.'s, &c., and washing and drying room for towels and bathing-dresses. The water will be warmed by the injection of steam round the sides close to the bottom of the bath, the pipes being in chases, and cased for protection.

#### Special Schools.

The mixing of children mentally weak with those of normal intellect being productive of undesirable effects on both, it has been found necessary to provide accommodation for these in specially planned buildings. There are thirty-nine centres in actual work in London, with 1,597 children on the rolls (October 31st, 1898), and about thirty-five more are either in course of building or immediately contemplated. The unit for classroom is less than that for the ordinary school, more individual attention being required. The classrooms are all on the ground floor, are 20ft. square, and seated for twenty children. A hall corridor about 20ft. wide, well warmed, and made as cheerful as possible, is provided for exercise, drill, &c. A good lavatory and baths are provided, boys and girls are frequently taught in mixed classes, but have separate playgrounds and offices. Schools for the deaf are also provided on the centre system, and are much on the same plan as those for the mentally defective. The classrooms are smaller, 18ft. square, and seated for ten. Seats should be arranged in a circle, and the rooms should have a strong high, or top light, so that the lips of the children can be watched and studied, they being taught to read what is said by the lip movement. The Board have seventeen centres in operation, with 513 children on the rolls (October 31st, 1898), and seven in course of provision. Particulars were given by the author of a scheme for the establishment by the School Board of a home for the boarding and instruction of deaf children who had to be taught on the sign system. The schools will be built on the cottage home principle, the number in each home not to exceed ten, and the training will be largely agricultural or horticultural. In most divisions of the London district school accommodation has to be provided for a few blind children. These number about 150, distributed over eight centres, and it is generally sufficient to provide two small classrooms at each centre with separate entrances, cloak rooms and lavatories, the classes being mixed. Separate play-yards and closets are necessary

(To be concluded.)

**Electric Light Extension at Edinburgh.**—It was resolved at a meeting of the Electric Lighting Committee to recommend the extension of the electric lighting subway from Picardy Place to Little King Street, at a cost of about £1,500.

**Excavations at Canterbury Cathedral.**—Excavations conducted by Mr. St. John Hope on behalf of the Society of Antiquaries have been in progress during the past few days in the garden adjoining the residence of the Bishop of Dover, in the precincts of Canterbury Cathedral. Five Early English corbels were found beneath the site of the old monastery dining-hall, similar to those recently found during excavations for the Archbishop's Palace. The discoveries go to prove that the whole of the buildings on this side of the cloisters were entirely rebuilt in the second quarter of the thirteenth century.

## ROUND TOWERS OF IRELAND.\*

By ANTHONY SCOTT.

(Continued from page 235, No. ccxxiv.)

DR. PETRIE says: "It is very evident that whatever may have been the original intention of the builders as to the use to which the towers were to be put, or whatever the use to which they have in the course of time been put as the necessity arose. It would be rather an absurd assertion to state that the large towers which we see standing before us to-day were built even as far back as early Christian times, to hang the tiny little hand-bells which were then in use; but with later developments of both buildings and bells there can be no possible doubt as to the fact that the towers served as bell houses." One of the last towers built in Ireland was that of Ardmore, in co. Waterford, and I observed that even in this tower no provision had been originally made for a beam or fixtures of any kind to carry a bell, but the interior bore marked traces of cuttings having been subsequently made for this or some purposes of the kind. It is at all events quite evident that the towers, if not chiefly constructed as places of refuge, were at least used for that purpose afterwards. Taking into account the fact that the country at the time was governed by provincial kings and petty chieftains who were eternally at war and raiding each other's territory, there must have been but little security for either life or movable property. It is a well-known fact that the domestic architecture of the Middle Ages was designed and constructed to meet the requirements of lawless times; it is therefore quite reasonable to suppose that ecclesiastics had to look to their own security and that of their effects. They could not build their churches and dwellings within fortifications, they built in the open plains and valleys, and were consequently exposed to the attacks of marauding freebooters, men who lived by rapine, and would carry off church property with as easy a conscience as that of any ordinary layman.

The Very Rev. Dr. Fahey, Vicar-general of the diocese of Kilmaedagh, in a work published in 1893, entitled "The History and Antiquities of the Diocese of Kilmaedagh," devotes a chapter to the subject of the round towers generally, but more particularly to the Round Tower of Kilmaedagh in his own extensive parish. Dr. Fahey considers that the Round Tower of Kilmaedagh is by no means the earliest stone building at Kilmaedagh, but there is a close affinity of style between the masonry of the Round Tower and that of the Cathedral Church, which undoubtedly is one of the latest

buildings at Kilmaedagh. The masonry in the lower part of the tower and church may be termed cyclopean, if the term is admissible, in closely-jointed hewn stone of great size. There is another peculiarity in the masonry which I have not seen elsewhere, except in the west end of the cathedral church at Glendalough, namely, a peculiar notching or checking of some of the large stones. This tower is 110ft. in height, the circumference at base 56ft. and leans about 2ft. or 2ft. 6in. from the perpendicular; in this respect it is frequently compared to the leaning tower of Pisa. The doorway measures 6ft. 10in. high, and is circular headed, the arch being cut out of a single stone, the jambs incline slightly towards the top, the sill stands 26ft. from the ground. The historian Archdale puts this down as leaning 17½ft. out of the perpendicular, or 4½ft. more than the tower of Pisa. This is a fair sample of reckless writing. It may be well to explain here what I believe to be the sole and only cause of the leaning of this tower. It may appear strange, but it is nevertheless a fact, that the ancient ecclesiastical buildings, including the round towers, have practically no footing courses and very little foundations. In the case of the tower the walls at foundation are generally very thick, and in this way being circular, and from 13ft. to 18ft. in diameter, may be said to practically cover the whole area within the external circumference. The foundation at Kilmaedagh is 5ft. to 5ft. 2in. thick. The tower is built upon soft, vegetable earth. The depth of rich, brown, vegetable earth between the lower footing course and the undisturbed virgin earth varied from about 22in. on the east side to 26in. and 28in. on the west side. It can be easily conceived that the leaning of the tower towards the west was due to a greater depression caused by the immense superincumbent weight on the thick layer of soil on the west than the lighter layer on the east. There cannot be the slightest doubt as to the tower having been built in a Christian burial ground and on the top of Christian graves, as three human skeletons were found side by side, partly in the centre and partly under the foundation of the tower, and facing the east, which is the general mode of Christian sepulture in Ireland. Similar excavations have been made with a like result in the towers of Kilkenny, Ardmore, and Drumbo, &c.

The latest published work which I have met with, devoting a chapter to the round towers, is "Devenish: Its History, Antiquities, and Traditions," by the Rev. James E. McKenna, C.C., M.R.I.A., Enniskillen. The work is beautifully illustrated, and gives a fine photo view of the tower, a section to scale, as well as various details and measurements. The total vertical height of the tower of Devenish is 81ft. 6in.; circumference at base, 49ft. 9in.; immediately under cornice, 42ft. 7in.; cone capping perpendicular, height, 14ft. 10in. The door is 8ft. 6in. over plinth, and measures 5ft. 3in. in height, by 2ft. in width, having a semicircular arched head, the arch being formed of five stones, neatly and closely jointed. The jambs and arch are decorated with a flat band or architrave. Immediately under the spring of the arch is a stout iron hook to receive the door hinge, while directly under this there is a socket to receive the heel spud of door. The tower was divided originally into five storeys, the floors having been supported on offsets, which run all the way round the interior and project about 6in. Between each two offsets are a pair of corbels, evidently intended to support stairs. On a level with the cornice, and immediately under the conical cap, there is a similar string course which could not be intended to support a floor, as the space in attic would be very limited indeed. The top storey is lighted with four square openings; each of the other storeys has one opening. The most interesting feature of the tower is the richly sculptured cornice under the cap, which displays four quaintly carved human heads over the four windows. The stones of both interior and exterior are dressed to the required course, which justified Archdale in comparing it to a "gun barrel."

In describing the construction and characteristic features of the towers, I cannot do

DETAIL OF DECORATION OF AN IRISH TOWER.

better than quote Dr. Petrie, for my experience is that he has most accurately described them in every detail. These towers are cylindrical structures, usually tapering upwards and varying in height from 50ft. to perhaps 150ft., and in external circumference at the base from 40ft. to 60ft. or somewhat more. They have usually a circular projecting base, consisting of one, two, or three steps, or plinths, and are finished at the top with a conical roof of stone, which frequently, as there is every reason to believe, terminated with a cross formed of a single stone. The wall towards the base is never less than 3ft. in thickness; it is usually more, and occasionally 5ft., being always in accordance with the proportions of the building. In the interior, they are divided into storeys varying in number from five to eight, as the height of the tower permits, and usually about 12ft. in height. These storeys are marked either by projecting belts of stone, set-off ledges, or holes in the wall to receive joists on which rested the floors, which were almost always of wood. In the uppermost of these storeys the wall is perforated by two, four, five, six, or eight apertures, but most usually four, which sometimes face the cardinal points and sometimes not; the lowest storey or rather its place is sometimes composed of solid masonry, but instances of this kind would appear to be very rare. When not so it has never any aperture to light it. The second storey is usually perforated by the entrance doorway, and is generally from 8ft. to 30ft. from the ground, and only large enough to admit a single person at a time. The intermediate storeys are each lighted by a single aperture placed variously and usually of very small size, though in some instances that directly over the doorway is of a size little less than the doorway, and would appear to be intended as a second entrance. I do not agree with Petrie in this assumption. I have never met with an example of a window over the entrance doorway which impressed me with the idea that it was ever intended to be used as an auxiliary to the doorway proper. The large window over door was more probably used for protecting the door. The door of Devenish Tower was clearly forced from the outside at some time. If there was no means of protecting the door, what was to prevent the attacking party forcing it?

In their masonic construction the towers present a considerable variety, which I assert goes a long way to prove my suggestion that in these buildings, as well as in every other class of architectural structures, there has been great development from things poor and simple (like the round cells and houses at the start) to the beautiful and lofty tower at the finish as ages rolled by. The generality of

DETAIL OF DECORATION OF AN IRISH TOWER.

\* A paper read before the Society of Architects on Thursday, April 27th.

those which now exist are built of that kind of careful masonry called spawled rubble, in which small stones shaped by the hammer, are placed in every interstice of the larger stones, so that very little mortar appears on the surface of the finished wall, and thus the outside of spawled masonry especially presents an almost uninterrupted surface of stone, supplementary splinters being carefully centred in the joints of the undried wall. Such also is the style of masonry of the most ancient churches, but it should be added that in the interior of the walls of both grouting is generally, but not always, abundantly used. In some instances, however, the towers present a surface of ashlar masonry (but rarely laid in courses perfectly regular) both externally and internally, though more usually on the exterior only, and, in a few instances, the lower portions of the towers exhibit less of regularity than the upper parts.

In their architectural features an equal diversity of style is observable, and of these the doorway is the most remarkable. When the tower is of rubble masonry the doorways seldom have any decorations, and are either quadrangular and covered with a lintel of a single stone of great size, or semi-circular and headed either by the construction of a regular arch or the cutting of a single stone, hollowed out to resemble an arch. There are, however, two instances of very richly decorated doorways in towers of this description, namely, those of Kildare and Timahoe. In the more regularly constructed towers the doorways are always arched semi-circularly, and are usually ornamented with architraves or bands on their extreme faces and sometimes a roll moulding. The upper apertures but very rarely present any decorations, and are most usually of a quadrangular form. They are, however, sometimes semi-circular headed, and still oftener present the triangular, or straight-sided arch. I should further add that in the construction of this aperture very frequent examples occur of that kind of masonry, consisting of long and short stones alternately, which is more generally considered by antiquaries as a characteristic of the Saxon architecture in England.

The stones used in the construction of the towers varied with the locality in which they were built, and consisted generally of blue limestone, which is the most general formation of the country. Black calp, green clay, mica slate, a little granite, generally in doorways, as at Glendalough, and sandstone, &c. The primitive stone-built churches from the days of the circular churches, without exception, were all quadrangular on plan. The peculiar oratory at Gallerus would appear to be the first transition from the round to the square, but in later years the majority of these churches have had small chancels added to them at the eastern end in all cases, and cutting away the east end wall of the church and forming an arched opening in same to connect it with the older church, or what then became the nave. In some cases new doorways and new windows were introduced, and in all such additions, alterations, or improvements there has been no attempt at imitation, bonding or interlocking the new work with old. The Round Towers have been less tampered with or altered than any other class of architectural remains in the country. There are, however, some instances of alteration, such as the battlemented tops to be seen at Kildare and Cloyne, the stunted capping which replaces the original conical capping, as at Donaghmore, co. Meath, and Lusk, co. Dublin. In the construction of the towers each architect seemed to follow his own fancy (except in rotundity alone), so much do they vary in height and in the disposition and number of the apertures, and in the height the different doorways stand from the ground.

I feel assured that this was proportioned to the surrounding ecclesiastical buildings and to the requirements of the place. It becomes evident when we compare the towers now remaining with one another, that very considerable developments of knowledge, with progressive skill in the art of building, may be traced in the various examples, and that the signs of change are analogous to that

which took place in the church architecture of Ireland after the eighth century. The transition from coarse rubble masonry with square headed openings, to neatly dressed and coursed ashlar, with circular head and moulded arched openings, has evidently been of slow growth. The remains of the existing towers might be classified into three or four distinct groups, showing the transition from those built with unhammered field boulders, and those buildings having circular arched moulded openings, with correctly radiated arch joints and moulded architraves as at Timahoe, Armadown, Temple Finan, Kells, O'Rourke's Tower, Disert O'Dea, &c. The first circular headed openings in both church and tower were formed or scooped out of one large stone which formed the lintel, and was generally the full width of the wall. In the case of window openings of the churches, they were very small openings on the outside, and deeply splayed on the inside. In the case of the tower openings, the top lights were seldom, if ever, splayed, but the smaller openings are slightly splayed.

As regards the suggestion that the towers have been surmounted by crosses composed of a single stone, we have at least one example, that of Ardmore. In Dr. Smith's "History of Waterford," published early in the seventeenth century, he has given an illustration of the tower of Ardmore, showing the cone to have terminated with a cross, and so satisfactory was the evidence in the case, that when the tower was being restored in 1875, the cone was surmounted by a terminal in the shape of a Celtic cross. In Glendalough the whole cone or cap was missing at the time the ruins were vested in the Board of Works as national monuments, but a large amount of the original stones which formed the capping were found in the burial ground, in the centre of which the tower stands. The most important stone found was the apex stone, which, like that of Ardmore, had a deeply cut socket, about 4 in. or 4½ in. square, which could be there for no other purpose than the reception of the shaft of terminal, and I think it requires no great stretch of imagination to assume that such terminal was neither more nor less than a representation of a cross of some kind. The apex stone at Glendalough occupies to-day the same position which it occupied centuries ago, minus the terminal cross. The conical cap was rebuilt principally with the old stones, and the apex stone replaced, but the Government authorities, in conjunction with the Church Temporalities Commissioners, decided not to replace the cross, considering it more desirable to still leave the question of the Christian origin of the towers open to discussion.

One of the buildings at Glendalough is a stone-roofed church, and one of the finest specimens of its kind in Ireland. On the western gable of this church rises a small belfry tower, an exact fac-simile of the large round tower which stands at a distance of about sixty or seventy yards away. This building is supposed to be the first attempt in Ireland to unite church and tower. That it has been built with the church cannot be denied; it requires no expert knowledge to prove this. Anyone can see it to be part and parcel of the stone roof of the church. This small tower has an apex stone identical in every respect to the apex stone of the large tower, and it has also a socket for the reception of a terminal, which terminal must have been a Christian emblem, and that emblem must of a certainty have been no other than a cross. We have crosses in relief over the doorways of the towers of Antrim, Donaghmore, co. Meath, and Breckin—in Scotland—a round tower built by Irish missionaries, and no person will, I think, attempt to deny that these crosses in relief are coeval with the said towers. If they were incised crosses there would be room for argument, for they could be incised at any time since the erection of the towers. Having these crosses and figures of the Crucifixion carved on the lower portions of the tower, is there any valid reason to deny that the conical cap of the towers terminated with a cross? So far as my judgment and experience goes, I see no just reason for doubt.

## Enquiries Answered.

*The services of a large staff of experts, including all those engaged on "Specification," are at the disposal of readers who require information on architectural, constructional, or legal matters. Questions should in all cases be addressed to the Editor.*

### ARCHITECTS' CHARGES.

To the Editor of THE BUILDERS' JOURNAL.  
TORQUAY.

DEAR SIR,—I should feel obliged if you could give me your opinion on the following: In a recent settlement of accounts on a villa contract, the architect concerned deducted a provisional sum (which he had stipulated in his specification) twice, or double the amount of sum stated, his reason being that by an error the item was set down in quantities twice. But I contend that as I prepared my own quantities, they did not form part of the contract, and that, therefore, he had no right to make such deduction, beyond the amount specified.—Yours faithfully, R. F. Y.

We think the double deduction was wrong.

### DISTRICT SURVEYORSHIPS.

To the Editor of THE BUILDERS' JOURNAL.  
NEW WANDSWORTH, S.W.

DEAR SIR,—Kindly inform me through your columns the qualification necessary for a district surveyor.—Yours faithfully, F. R.

It is first necessary to pass the special and very severe examination to qualify as a district surveyor, of which detailed particulars are to be obtained from the Secretary, R.I.B.A., 9, Conduit Street, Hanover Square, W. After that, appointment rests in the hands of the County Council as vacancies occur. To have passed the examination gives no right to appointment, though it is a necessary precedent. G. A. T. M.

### WROUGHT IRON BEAMS.

To the Editor of THE BUILDERS' JOURNAL.  
LONDON, S.E.

SIR,—In the supplement to the BUILDERS' JOURNAL for last week, in the article on "Wrought Iron Beams," the second equation for box girder is wrong; it should be 7.31 sq. in., instead of 6.31 sq. in. Would not the 6.74 sq. in. in the previous equation be sufficient?—Yours truly, J. P. BISHOP.

We are obliged to our correspondent for pointing out the error, which arises from the accidental substitution of the figure "4" for "5" in the preceding line. But the whole paragraph might be omitted, as the 6.74 sq. in. of the previous equation might safely be taken as sufficient.

### SWISS ARCHITECTURE.

To the Editor of THE BUILDERS' JOURNAL.  
NEWTON ABBOT.

DEAR SIR,—I am about to design a small villa residence in the "Swiss Style" for a client of mine. I should be much gratified if you would kindly inform me in your enquiries column what books I can get on the subject, viz., Swiss Architecture. I should like a book with descriptions of the style and illustrations of examples executed in the same.—Yours truly, "SWITZERLAND."

"Varius' L'Architecture Pittoresque en Suisse" is a book that will suit your requirements. It contains forty-eight engraved plates of plans, elevations, sections and details, and could probably be obtained from Mr. B. T. Batsford, of 94, High Holborn, W.C.

### ARCHITECTURAL SKETCHING.

To the Editor of THE BUILDERS' JOURNAL.  
NEWCASTLE-ON-TYNE.

DEAR SIR,—Can you advise me as to the best kind of pen and paper for pen-and-ink sketching? What can one do to gain some

style, or, indeed, any degree of facility in such sketching, and what reproductions of architectural work can you suggest to study?—Yours truly, B. B.

The pen used for pen and ink sketching depends so much on your style of sketching, that it is not easy to advise the best to use; avoid, however, all fine pens, as the use of these invariably makes a drawing look scratchy. An ordinary writing pen is often the best to use, more especially when it is a little worn. Whatman's mounted board—not "surface"—is the best we know of for pen-and-ink drawing. With regard to the reproduction of architectural drawing for study we should suggest that you obtain a copy of "Pennell's" work on pen-and-ink drawing, where you will find all the best work of the day. It is a great mistake to endeavour to copy the technique of any one man, as this eventually leads to a loss of all individuality.—H. I. T.

### JOINT DRAINAGE.

To the Editor of THE BUILDERS' JOURNAL.

LONDON, N.

DEAR SIR,—You kindly answered some questions of mine in your issue, dated April 12th, page 154, on the above. Unfortunately the Sanitary Inspector refuses to admit your view and says it is a joint drain repairable by the owner; while the L.C.C. state that the question of liability depends very largely on the circumstances under which the drain was laid; and although they both state that I am under some misapprehension as to the effect of recent decisions, neither of them gives any hint as to what circumstances cause a joint drain to be considered to be a sewer. I should be glad if you could give me any further advice. Should I have to give way owing to being unable to fight the question, have I any claim on the adjoining owner for expenses incurred in connection with the joint drain? As I have received notice to open the drain, and as it runs under a building, this means considerable expense.—Yours faithfully, C. S.

Our previous reply was based upon personal experience of a similar case in one of the London suburbs just outside the jurisdiction of the L.C.C. The question is one which has been contested, we believe, more than once, and quite possibly the L.C.C. are right in saying that special circumstances must be considered in each case. This being so, we would suggest that a solicitor be consulted, to whom everything can be exactly and personally explained. G. A. T. M.

### Lias Lime for Plastering.

To the Editor of THE BUILDERS' JOURNAL.

GREAT YARMOUTH.

DEAR SIR,—May we have through the valued Enquiry Department your opinion as to the suitability of stone lime for plastering purposes? We have recently erected a house and have used the best lias lime we could procure. In mixing a proper, but not excessive, quantity of sand was used and hair as customary. It has not, however, been very satisfactory, the ceilings particularly lacking cohesive power, and in some parts it has become detached, although the key has not given way. Can you suggest any reason for this?—Yours truly,

"YOUNG BUILDERS."

Lias lime is very variable in nature and quality, and requires great care in stocking to avoid failure when used for plastering purposes. If soft or loamy sand was used in making the floating stuff the work would be weak and lacking in cohesive power. If too great a proportion of sand was used similar results would ensue. Again, there is the item of hair, both as regards quality and quantity. Coarse stuff made by the cold process is not so destructive to the hair, and consequently to the work, as when made by the hot process. An analysis of small portions of the coarse stuffs used for the first coating and for the floating would enable the question of failure to be settled satisfactorily. W. MILLAR.

## Bricks and Mortar.

EFFINGHAM HOUSE, ARUNDEL STREET,  
LONDON, W.C.

May 31st, 1899.

"I know what it is to live in a cottage with a deal floor and roof, and a hearth of mica slate; and I know it to be in many respects healthier and happier than living between a Turkey carpet and a gilded ceiling, beside a steel grate and a polished fender. I do not say that such things have not their place and propriety; but I say this, emphatically, that the tenth part of the expense which is sacrificed in domestic vanities, if not absolutely and meaninglessly lost in domestic discomforts and incumbrances, would, if collectively offered and wisely employed, build a marble church for every town in England; such a church as it should be a joy and a blessing ever to pass near in our daily ways and walks, as it would bring the light into the eyes to see from afar, lifting its fair height above the purple crowd of humble roofs."—JOHN RUSKIN.

We reproduce this week, in the **Our Four-Page Plate**, form of a four-page plate, an old engraving, kindly lent by Mr. W. C. F. Gillam, of Brighton, which is of special interest at the present time, in view of the controversy occasioned by Sir W. Richmond's decoration of St. Paul's Cathedral. The inscription under the original engraving, which was published in 1801, is as follows:—"To his Royal Highness George Prince of Wales, this section of St. Paul's Cathedral, decorated agreeably to the original intention of St. Christopher Wren, is, with all humility, inscribed by his Royal Highness' most devoted and most obedient, humble servants, Sam. Wale, Jno. Gwyn." Assuming, as we fairly may, that the engraving is what it purports to be, we are enabled to form a fair idea of what the present appearance of the cathedral would have been, had Wren's intentions with regard to the decorations been carried out. It will be noticed that the illustration represents the cathedral without a choir. This was according to Wren's original design, as may be seen from a model he prepared which is still at the South Kensington Museum. The plan was a Greek cross, but this displeased the clergy and was accordingly rejected, owing to its being imperfectly cruciform, and the Latin cross was adopted instead.

### St. Paul's Churchyard.

It was not to be supposed that the suggestion for widening the north side of St. Paul's Churchyard would be universally approved. Your average City man thinks more of a fractional increase to the rates than of the finest view in the world. The writers of a recent letter to the "Times" express what is no doubt the sentiment of many business men. "We are overburdened at present," they say, "with all sorts of costly metropolitan improvements, and each item helps to swell the great burden. For instance, there is the Blackwall Tunnel to pay for, about a million; Rotherhithe Tunnel projected, about two millions; Holywell Street, half a million; Holborn to the Strand road proposed, five millions, with a large but imaginary recoupment; Parliament Street and offices, unknown millions; South Kensington Museum, half a million; and this with an income tax at a war rate of 8d. in the pound after many years of peace. Where is all this to end?" Of course London improvements are always expensive affairs, but our own view is that this particular improvement is well worth the price it would cost—£300,000 say the correspondents quoted above. This seems a large sum, but the burden on individuals would be quite trifling in proportion to the benefit to the community.

### A Prejudiced View.

ANOTHER objection, with which we confess to having some sympathy, is raised by a gentleman whose premises are in St. Paul's Churchyard. "At the present time," says this correspondent, whose letter appeared in the "City Press," "the roadway between the shops from Nicholson's corner to the commencement of Ludgate Hill is closed to vehicular traffic, with the result that it forms a pleasant promenade for the public, and affords them a splendid opportunity of conducting their shopping under the most pleasant circumstances. This fact in itself constitutes an income to the tradesmen in the occupation of the premises, and certainly they may be expected to offer a most determined opposition to the proposal if it is formally made before the Common Council." This gentleman admits that his view may be a prejudiced one. Of course it is, and equally, of course, he would have to be compensated—we do not say at his own valuation, but at any rate on a liberal scale. Considerations of the kind he advances might be urged in opposition to almost every City improvement that has been or will be put in hand. Someone's private interests are always interfered with. The individual citizen is not often nowadays called upon to sacrifice himself for the public weal; he is perfectly justified in demanding and fighting for ample compensation, but he is not justified in absolutely opposing an improvement demanded in the interests of the health, convenience, or enjoyment of the citizens as a whole.

### Kensington Palace.

KENSINGTON is the home of exhibitions for the people, and another has been added to the already long list by the throwing open to the public of Kensington Palace. On January 11th, 1898, Her Majesty announced her desire that the State Rooms, in the central part of the buildings, and Sir Christopher Wren's Banqueting Room should, after careful restoration, be opened to the public. In the following April the House of Commons voted £23,000 for the purpose of restoring the Palace. At this period the walls were bulging, and had to be shored up, the rafters of the roof were beginning to rot away, tiles and slates were broken, the floors were deteriorating, and the panelled walls and painted ceilings were slowly decaying. The work of renovation was undertaken by the Board of Works, and has been carried out with much taste. Care has been taken to follow the old style wherever the original was damaged, and the whole work shows that the desire has been to imitate as nearly as possible the old designs, and not to make old work into new, repairing, patching, mending, piercing, and cleaning having been the main occupations of the decorators. The Orangery, perhaps one of the finest examples of Renaissance work in England, has received the careful attention of the renovators. The walls are wainscotted high up with carved cornices, and the floor is covered with granolithic pavement, except in the alcoves at either end, which are stone flagged. A good idea can now be obtained of what the place must have looked like when first built, although at that period the woodwork was probably painted white, and not stained as now.

### Old Paris Disappearing.

THE Paris Correspondent of the "Dundee Advertiser" bewails the loss of historical buildings through the march of improvement. He says that to the historical student Paris is somewhat disappointing. Everywhere, on street and avenue and boulevard, are names that thrill with their historical associations, but for the most part the old buildings which live in history have been swept away in the passion for improvements. Churches alone seem to have the power of resisting the destroyer. From the point of view of a City Improvement Act, nothing could be finer than the wide streets and handsome buildings which are found almost everywhere. Architects are encouraged to excellence by the offer of prizes by the municipality for the best frontage, and one can see on almost every new building the name of the architect by whom it was planned. But one

may be allowed to say that, while each building, taken by itself, is a handsome structure, the general effect is lacking in variety. One avenue is very like another. Indeed, the city seems to have been laid out by one engineer, the houses to have been planned by one architect, and built with stones taken from one quarry. It is magnificent, but it is not picturesque. It is only in the older and business parts of the city that one sees that the Paris of former days resembled one of our own cities.

**British Archaeological Association.** This association met at the rooms in Sackville Street on May 17th, Mr. Compton, vice-president, in the chair. Mr. Patrick, hon. sec., announced that the Marquess of Granby had accepted the office of President of the Congress and the Association for the ensuing twelve months. Two very interesting rubbings of incised designs on the headstone of the Piscina in the south wall of the Templar's Chapel at Garway, Dorset-on-Wye, were contributed by the Rev. Dr. Minot, the vicar of Garway. They were discovered late last year on removing plaster. On the left side of the Piscina is a fish, representing the baptised, and on the right, a horned adder representing the unbaptised. In the middle is a cup marked with a triangle and raised a little; above the top is a cross within a circle; the cup has two rings. Dr. Minot considers this to be emblematical of the exaltation of the consecrated altar. The second rubbing was of incised work on the inside face of the broken tympanum of the west door of the Templar's Chapel; on the left side is a spear, and near it a ladder; on the right a cup with a cover, and near it a reed and a sponge. In the middle is a TAU cross, with a crown over it; three nails, and a sword beneath the arms. These clearly represent the instruments of the Passion and the crown of glory. The work is rude in character, and of early date, probably pre-Norman. Mrs. Collier exhibited a rare volume of the early part of the seventeenth century, entitled "A History of the Gospel," in fine condition, and Mr. Grimdsale photographs of a pair of hand millstones, recently dug up in a brickfield near Uxbridge. The stones are 14in. in diameter, and were found under about 4ft. 6in. of brick earth. A paper contributed by Dr. Russell Forbes, on "The Remating of Caesar" and the recent "discoveries in the Forum at Rome," was read, in the absence of the author, by Mr. Patrick, hon. sec.

**Decorative Renaissance.** In Paris, last Wednesday, Messrs. Waring and Gillow's new house was formally opened in the presence of a large number of the leading inhabitants, who were unstinted in their expressions of admiration of the beautifully decorated apartments. The entrance to the building from the street is treated as an open hall in Elizabethan style, and at the top of a staircase opposite is a vestibule arranged as a smoking and lounging room. This is panelled high in Jacobean style in ivory white. The ceiling of the drawing-room is an excellent copy of an Angelica Kauffmann ceiling. The colouring employed is tasteful, and the rose silk panels are framed with delicate arabesque ornamentation that is essentially in the Adam style. The dining-room is of the latter Victorian period; the panelling and antepiece generally are of fumed oak. The library is fitted throughout with inlaid mahogany after Sheraton. The whole building displays thoroughly the beauties of decorative renaissance, and reflects great credit on the artists who have designed the work.

**Exhibited Alone.** The Berlin Secessionists have long desired to have a special selection committee and special rooms at the great annual art exhibition at Berlin, but the Berlin Academy refused to grant the favour. The consequence is that they have started an exhibition of their own in Charlottenburg, which embraces about 300 works of art. The principles upon which the exhibition is

founded are almost ideal. The Secessionists say that they are convinced that the heaping together of numberless pictures in one exhibition is as much against the interests of the public as it is injurious to art. The endless succession of rooms filled with paintings wearies the eye of the spectator, who, amidst a desert of mediocrity, loses sight of the few really good works. (Our own R.A. might make a note of this.) Talent alone, say the Berlin Secessionists, in whatever manner revealed, has been decisive in securing their approval. They say that for them there is no Royal School of Art, but every work in which genuine feeling is incorporated appears to them a work of art. These are good principles, and it is well to note that they have been carried into effect. Nearly all the names of note of which the Secessionist movement in Berlin, Munich, Dresden, Karlsruhe, and Stuttgart can boast are included within the limits of this small exhibition. It also embraces work from men who stand far removed from the strife of parties.

**Iron Gates at Chiswick.** The fine specimens of old iron-work here illustrated is in front of Walpole House, on Chiswick Mall. The house itself is a very interesting specimen of domestic architecture. The iron-work has been restored and renovated, and, apart from its artistic interest, it has a special

### Anglo-Roman Antiquities.

THE extent of the discoveries of antiquities found during last year's excavations at Silchester on the site of the large Romano-British town or city has led the Society of Antiquaries to hold an exhibition at their apartments at Burlington House. This was opened last Monday, and a large number of articles is being exhibited. The operations were confined to the South-west corner of the city, where an area of about eight acres had been reserved for the season's work. Insula nineteen presents the peculiarity of being inclosed by a wall, and contains, in addition to minor buildings, a well-planned house of large dimensions with fine hypocausts. The area of the courtyard of this house is partly underlaid by the remains of a much earlier one of half-timbered construction, with a mosaic pavement of remarkable design in one of its chambers, a pavement which is considered to be perhaps the earliest in date yet found in this country. This beautiful piece of mosaic work is the most important and interesting of last year's finds. The design is highly artistic, and consists mainly of flowers and leaves conventionally treated and executed with great skill. The colours are well preserved, and the materials used—viz., white limestone, grey lias, red and yellow tiles, and bits of Purbeck stone—are all local products. The other articles exhibited are of the usual kind, including vessels in pottery of

IRON GATE IN FRONT OF WALPOLE HOUSE, CHISWICK MALL, W.

interest by reason of its literary associations. For it is said that these are the "lace-like" railings referred to in Thackeray's "Vanity Fair," and that the house was the one that figured in the book as Miss Pinkerton's Academy. Consequently, it was through this particular gateway that Rebecca Sharpe threw back the copy of Johnson's dictionary that had just been presented to her.

various types, one of which contained partly incinerated human bones; specimens of glass, and bronze rings and pins for personal adornment. Over £4,300 has been expended since the formation of the Silchester Excavation Fund, and it is estimated that a further sum of at least £3,000 will be required by the Executive Committee to complete the examination of the area within the walls.

## Correspondence.

### SMALL COMPETITIONS: ARE THEY DESIRABLE?

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—I always consider that competitions for small and simple buildings should be discouraged.

I am an advocate of competition for buildings of reasonable size, but the country is flooded with advertisements of competitions for small buildings under ridiculous conditions, and very young men and others entering for these give the outside public an idea that an architect will work under almost any conditions, which is a result very damaging to the profession.

Some weeks ago I wrote for conditions of a technical school competition at Frome, in Somerset. The offers made were three premiums of £50, £20, and £10, for an £1,800 building; no guarantee given of the employment of the man placed first; architects to ascertain levels of site, and call at the public offices in Frome to see drawings giving the desired accommodation, which was not stated in the conditions, for which a 10s. deposit was asked.

I sent back the conditions, pointing out that if that was all they could offer they had better get the best man in Frome to carry out the work, that the sum named would suffice to cover the cost of a building 6ft. high on the site at 6d. a foot cube, and that if they imagined anyone worthy of the name of architect would compete for a small building on such terms they were very much mistaken. Now has not a system been abused when such offers are made?—Yours faithfully,

H. W. W.

[The above letter is written in special reference to our competition for a country house, of which our correspondent does not altogether approve. We have reason to know that the announcement of our competition has given great satisfaction to many of our readers. Still, the question of the desirability or otherwise of these small competitions is an arguable one, and we shall be glad to hear the opinions of other readers.—ED. B. J.]

### REGISTRATION OF ARCHITECTS.

To the Editor of THE BUILDERS' JOURNAL.

ST. JAMES' HALL, PICCADILLY, W.

DEAR SIR,—The R.I.B.A. will doubtless be gratified that Mr. Jemmett has put a name to the reason of their opposition to the measure, though we think it is not the one they would themselves advance, while the profession generally would be greatly interested in having your correspondent's definition of "a decent interval," which in his opinion, would elapse before the Institute took the matter up, failing the Registration Bill Committee and this Society doing so. Would it be another forty years?

The question of registration is one in which party politics should have no place, and the body who support this principle, and consequently the bill, is the one which will have the support of all those who place the good of the profession before self interest and party feeling.—Yours faithfully,

C. McARTHUR BUTLER.

Secretary, the Society of Architects.

To the Editor of THE BUILDERS' JOURNAL.  
LONDON.

SIR,—I have read with much interest, and hope that I shall continue to do so for some weeks yet to come, the correspondence which is now appearing in your valuable paper upon the above subject.

I am in full agreement with Mr. BONNER when he says that "registration would undoubtedly enhance the status of an architect in the eyes of the public"; but when he says that architects' pupils are simply made office drudges, I cannot agree with him, for during the whole of my articles, I received nothing but the greatest kindness and personal attention at the hands of my master, and I shall always look back upon the days of my articleship with

the greatest respect both for my principal and also for his assistants.

With regard to the objection made to registration that a number of undesirable men would have to be admitted in the first instance, I fail to see why this should be made such a strong point of opposition, as it appears to be, for whenever the registration of architects does become law, they would have to be admitted, and I ask why not admit them now and thus pave the way for a purer profession in the next generation?

A YOUNG ARCHITECT.

To the Editor of THE BUILDERS' JOURNAL.

SHEERNESS.

SIR,—The controversy on this subject from the present tone of letters thereon bids fair to fall through without any good resulting therefrom.

It would appear that those interested in the higher or art aspect of the profession will swamp by argument those fighting for the more practical and everyday portion of same, as from the pedestal of art, they do not and cannot have any idea of the provincial and working-class element which now enters very largely into the practice of an architect (especially provincial). This can be plainly seen if one walks through any town where building operations are going on, the work of men—self-styled architects—whose numbers are increasing to an alarming extent, who have not the slightest training, and who do not know good material from bad, much less the rudiments of architecture. It is a shocking thing to have to witness continually the monstrosities being erected by these unqualified men.

The question arises, is this state of things to continue or shall some steps be taken to check and ultimately stop it? Why should not the poorer classes be housed in small habitations which should be made convenient, sanitary, and more pleasing in appearance? Registration will not affect those whose life study is that of art, and whose position in the art world could therefore not be questioned. Registration cannot injure such; their work proclaims their superiority in that respect as heretofore, and opposition from such sources seems rather out of place. Plenty of scope is already open to them in the larger and more important private and public buildings of the period; why should not measures be taken to insure that the poorer man may live in a cottage or middle-class dwelling upon the planning of which the same amount of intelligence has been exercised as in the case of higher class work? This would tend to elevate the classes and lead to a better appreciation of art.

The first step would, of course, be to check the influx of non-professional untrained men who trade on the British public, and the best means to that end appears to be "Registration." A medical man brings his science and experience to bear on a patient under treatment for a minor malady as well as on a serious case. Why should it not be so with the architectural profession, those of highest degree in each case taking the principal patients or clients? —

G. M.

To the Editor of THE BUILDERS' JOURNAL.

19, CRAVEN STREET, W.C.

SIR,—As a member of the Architects' Registration Bill Committee, as well as of both the R.I.B.A. and the Society of Architects, I have been exceedingly interested in the discussion now taking place in your pages upon the subject of registration, and cannot but compare in my mind the tone of the letters already published with those which appeared in one of your contemporaries some years ago on the same matter. The acrimonious opposition of that time has disappeared, and in its place there is carefully considered weighing of pros. and cons., showing a decided growth of opinion in favour of the reform in the organisation of the profession of Architecture, which we all now understand to be covered by the word "Registration."

All know now that the Bill, which was drafted several years ago, and which many of

us hope may become law long before as many years again have passed, provides, not merely for the listing and registering of architects now practising or qualified to practice, but for the proper education of all aspirants for entry into the architectural profession in the future. It is this—the educational—which is its most important side; and it is its unselfish character as benefitting future generations rather than the present, which accounts for the little interest taken in it by the older, well-established men who can scarcely hope to benefit by it. At the time the measure was subject to attack on the educational side by those who said that its passage would deprive Architecture of artistic exponents; but this argument, though it has been half-heartedly expressed recently in your columns by one correspondent, is rarely heard now. Those who have voluntarily submitted themselves to the R.I.B.A. examinations have now shown by the production of important works, and by the generally high standard of their attainments, that the acquisition of the generally accepted minimum of knowledge and skill is no bar to genius. It seems strange that any should have imagined it would be. The most serious opposition which the bill has met with—that, indeed, which has delayed its passing into law for several years—has been caused by those who have looked at the matter from the purely selfish point of view to how it would affect themselves. Men in good position and practice, generally elderly men, who could scarcely hope to live long enough to benefit by its gradual elimination of the unworthy from the ranks of English architects, objected to being placed upon the same "register" as all who at the present time possess a prescriptive right to earn their livelihood by the practice of Architecture. That men of high sensibility should feel this is comprehensible; but their objection is highly imaginary one, as the names of all who choose to call themselves architects, qualified and unqualified, worthy and unworthy, already appear side by side in alphabetical order in many a directory and list; and a similar arrangement in an official "register" would in no way make worse the position of these respectable gentlemen.

On the other hand, it is scarcely to be believed that a much-needed reform, affecting a whole profession directly, and through its members the whole country indirectly, should be blocked by the selfish pride of a few, however high may be their standing.

As Mr. Bonner said in your last issue, "time has now come for renewed and vigorous action, and I should be glad to hear from any fellow or associate of the R.I.B.A. who may be willing to join with me in concerting measures for bringing the subject prominently before the Institute next session."

Anything further than this, such as Mr. Bonner suggests, requires money and organisation, and could certainly be best undertaken by the Society of Architects, the body which with comparatively small means and limited membership has fought the battle of "registration" for many years. In order to complete its work it wants men and money. It is not an altogether easy matter now to obtain admission to its ranks, but those who wish to help should do so, the younger by submitting themselves to its well-managed examinations, the elder by satisfying the council as to their qualifications.—Yours, &c.

G. A. T. MIDDLETON, A.R.I.B.A.

Forest Green Chapel, Stroud, has been re-opened, after having been repaired at a cost of £550.

Church Extensions at Shirebrook.—The foundation-stone of extensions which are to be carried out at Shirebrook Church was laid on Whitsun Monday. The extensions consist of a priest's vestry, organ chamber, vestry, and chancel, to be erected at a cost of £575. Messrs. Fisher Bros., of Mansfield, have been entrusted with the work. On completion it is proposed to remove the walls on the north and south sides, and add a couple of aisles, so as to increase the seating accommodation.

## Views and Reviews.

### TRURO CATHEDRAL.

This little handbook, which is published by the authority of the Dean and Chapter of Truro, appeals to a much wider circle than the ordinary cathedral guide-book. The building of a cathedral is so rare an event that few can fail to be interested in the inception and carrying out of so important a project. Truro Cathedral has the distinction, we believe, of being the first newly-founded cathedral that has been erected in England since the Reformation. It is just twenty years ago since the plans prepared by the late Mr. J. L. Pearson, R.A., were accepted, and the work was definitely put in hand. The erection of the choir, transepts, baptistery, and a portion of two bays of the nave was completed in 1887, and this part of the building was consecrated for public worship. Then for nine years no special effort was made to continue the building until the sudden death of Archbishop Benson, first Bishop of Truro and founder of the Cathedral, suggested the completion of the building as a fitting memorial to him. The work of collecting the additional funds required has, therefore, been resumed, and the issue of this little handbook is well calculated to stimulate public interest in the project. The architectural notes, although written for the general reader, are fuller than one usually finds in similar works, and are evidently not written without knowledge. The book is illustrated with a large number of photographic reproductions.

"The Cornish See and Cathedral: Historical and Architectural Notes." Second edition, revised and enlarged. Price 1s. Heard and Sons, Truro.

### WOOD-CONVERTING MACHINERY.

This is a concise and useful little handbook, that should find a place in the foreman's office of every builder using machinery, and it would not be without its uses in the general saw-mill, where the author's advice (and Mr. Powis Bale is a well-known authority on machine construction) on the planning of mills, the economical handling of timber, the preparation of foundations to prevent vibration, &c., suitable boilers to use, and requirements to specify in ordering, rules for the calculation of speeds in various machines, and practical hints on wear and tear, the causes of slipping belts and their prevention, will all prove of service even to the most experienced mill-owner. The remarks upon the shapes of saw teeth, the sharpening and setting of saws, and subsequent mounting and "packing," will be appreciated by the operative machinist, who will find his own experiences and deductions explained and qualified thereby. The author emphasises the fact, which probably has not escaped the notice of the skilled mechanic, that a working band-saw a thin long blade will stand better than a short thick one; it will heat less, and cool more quickly. He also draws attention to another important point, often neglected in builders' mills, viz., that the saw is frequently tightened by the operator when running, that is when its length is greatest, and left "sprung" when finished with; of course on cooling it contracts in length, and if not slackened will at least be strained if not broken. In the section relating to planers much useful information will be found relative to the use of "four cutters," "indie moulders, panel planers, &c., with the methods of avoiding the everyday difficulties and faults, arising in the use of these machines. The instructions given for the tempering and speeding of cutters to work woods of various texture and hardness will, we think, require some modification shortly in the light of some recent developments. We find a short time since the opportunity of inspecting some first-class sunk moulded wheels in hardwood, turned out on a spindle chine with a cutter that when placed on the ratchet will, we venture to think, considerably punish those people who deem highly tempered steel cutters a necessity in woodworking machinery. Various special tools are touched

upon in this work, perhaps somewhat lightly, consequently upon the author's necessity of keeping the work within reasonable bounds, but the little he has to say is to the point, and users of sandpapering, wood-wool working, wood-block cutting, turning and dovetailing machines will find something to interest them. Specialties for railway carriage makers, wheelwrights, coopers, &c., are also treated, whilst the pages are dotted with a host of miscellaneous mill recipes, memoranda, rules, and tables, that should prove of great utility to prospective machine users. A most important part of mill paraphernalia, however, seems to have been overlooked; we allude to the covers and guards for cutters, saws, and belts, and there is room for much to be said and done in this direction. G. E.

"A Handbook of Saw Mill and Wood-Converting Machinery." By M. Powis Bale, M.I.M.E., A.M.I.C.E. Price 2s. 6d. W. Rider and Son, 14, Bartholomew Close, E.C.

## Keystones.

**Norwich Cathedral Nave** was re-opened last Thursday upon the completion of the unflaking of the interior.

**A New Public Mortuary at Yarmouth** has been erected on the North Quay from plans and designs by Mr. J. W. Cockrill.

**A new School** is to be erected at Darfield, at a cost of about £2,520, from the plans of Mr. A. B. Linford, architect, of Wombwell.

**A Three-Light Stained Glass Window**, by Kempe, has been fixed in the south aisle of Ledbury Church in memory of Mr. Edward Maddison.

**The Victoria Nurses Home**, in connection with the Swansea General Hospital, was formally opened by the Mayor of Swansea a short time ago. It has cost £1,800, and has been erected in honour of the Queen's Diamond Jubilee.

**A Clergy Training School** was opened at Cambridge recently. The site of the new building is opposite Jesus College. It is of red brick and stone, and has been built from the designs of Mr. Ould, at an estimated cost of £7,600.

**A Discovery at Bakewell Church.**—During recent excavations at the western end of Bakewell Parish Church, Sheffield, the workmen unearthed a portion of a series of massive quarry picked gritstone, which probably formed part of the foundations of what were intended to have been the western towers of the church.

**Mr. J. Lochhead**, an assistant in the architectural department of Her Majesty's Office of Works, who has just completed a long period of service, is about to retire. Mr. Lochhead entered the Civil Service in 1862, when Mr. Williams was the chief surveyor at Whitehall, and has later seen many years service under Mr. Henry Tanner, the present surveyor.

**Manston Infectious Diseases Hospital.**—At a meeting of the London Sanitary Committee a scheme by Mr. Edwin T. Hall, F.R.I.B.A., for the extension and completion of the hospital, was adopted, and he was instructed to prepare detailed plans and specifications. Over 300 additional beds will be provided, and extra accommodation for the resident staff.

**Church Schools, Wolverhampton.**—The memorial stone of new buildings in connection with St. Andrews Church was laid recently. The site, 1½ acres in extent, is in Gates Street, Whitmore Reans, and the buildings will provide accommodation for 292 girls and 335 infants. The total cost is estimated at £4,000. Mr. F. Hunter Lynes is the architect, and Mr. J. Herbert the builder.

**A Memorial Window to Sir Joseph Terry, J.P.**, was unveiled in the Guildhall, York, last Thursday. The window is of stained glass, and the subject is King Edward the IV. at Walmgate Bar, swearing allegiance to the House of Lancaster. Messrs. Shrigley and Hunt designed and made the window.

## Professional Practice.

**Airdrie.**—The result of the adjudication upon the competitive plans for a new elementary school at Coatdyke, to be erected by the Airdrie School Board, is that the plan by Mr. James Shaw, architect, Coatbridge, has been chosen—that of Mr. William Shanks, Airdrie and Glasgow, being awarded the second place and premium of £10.

**Bradford.**—The foundation stone of a new church in Grange Road, to be known as the Church of St. Columba, was laid on Whitsun Monday. The style is Early English, and the nave will be 79ft. long and 24ft. wide, with aisles on each side 11ft. 6in. wide, from which there will be projecting transepts on the north and south sides. At the west end there will be a vestibule about 8ft. long, with a similar width to that of the nave. On the north side there will be a chapel 35ft. long and 17ft. wide, and on the opposite side, or the south side of the chancel, there will be the organ chamber, as well as vestries for the clergy and choir. From this portion there will be a staircase leading to the basement, which will be furnished as parish rooms. The church will be built of local stone, with a roof of Westmorland slate, and will have a turret which will be 65ft. high and 9ft. in diameter. The turret will be octagonal in shape, and at its foot there will be an entrance to the parish rooms. The architects, Messrs. T. H. and F. Healey, have executed plans for a church which will be well lighted by leaded windows of an ornamental character. The pulpit and font will be of stone.

**Creswell.**—The Duke of Portland opened a new school at Creswell last week, which has been built at a cost of upwards of £5,000. The work of erection has been carried out by Mr. J. E. Simken, of Bolsover, to the designs of Messrs. Brewill and Baily, architects, of Nottingham. The school, which will accommodate 450 children, consists of a large central hall, seven classrooms, cloakrooms, and lavatories, with master's and mistress's rooms, all ranged over the projecting stone-pillared porches to the separate entrances for the boys and girls. The central hall has an open roof, and is surmounted by a bell and ventilating turret. The architecture is of the Georgian period, and carried out in red sand bricks, with stone dressings, white wood cornice, and green slate roof.

**Dundee.**—The Dundee Parish Council have approved of the plans for the new council offices by Mr. W. Alexander, the City Architect. The building is to cost about £6,500, and will be erected between Bell Street and Rattray Street. The building, when complete, will present to Bell Street an elevation of three storeys and attics. The masonry will consist of blue Forfarshire stone. The new offices will be erected to the order of Mr. W. Kidd, stationer, of Whitehall Street, whose tenants the Parish Council will become.

**Hawarden.**—Miss Helen Gladstone recently opened a new county school at Hawarden, which has been erected at a cost of £2,450, from plans by Messrs. Grayson and Ould, architects, of Liverpool. The buildings consist of two large central classrooms, divided by a sliding partition. To the west of this central block is the boys' wing, and to the east the girl's department. The rooms have high dados of enamelled bricks from Aston Hall Brickworks, chiefly of primrose tone, with skirtings and cappings of brown glazed bricks. Externally the walls are of red Ruabon bricks, with dressings and mullioned windows of red terra-cotta, from Mr. J. C. Edwards' works, and the roofs are of red Ruabon tiles. The arms of the county appear in the central gable. The contractors were Messrs. W. and T. Bailey, of Hawarden.

**London, E.**—The extension of the nurses' home at the London Hospital—the ground floor plan of which is here given—was under-

taken in 1895 to accommodate the increased number of nurses required, owing to the new regulations affecting their working hours, which were instituted by the hospital authorities. It was also felt imperative that there should be a special ward set apart for sick nurses. The building consists of basement and ground floor and five floors over, the roof space being fitted up and utilised as a box-room, with fireproof lockers and hanging cupboards. The servants are provided for in the basement. On the ground floor is the nurses' ward, 28ft. 6in. wide, for twelve beds, with a sisters' room adjoining. The sink room, w.c., and bathroom are cut off from the main building, and approached by a disconnecting lobby. The ward is heated by a Teale's hospital stove. The remaining five floors give accommodation for seventy-five nurses. In addition to the service staircase, there is an escape staircase in the sanitary block from the roof to the basement. There is also a luggage lift up to the boxroom in roof. The chaplain's house adjoining, is at present used as a temporary isolation hospital. The building is constructed entirely of fireproof materials, including the partitions between the bedrooms, which are Banks' Patent 2in. finished partitions. The nurses' dining-room,

which has seating accommodation for 1,500. The large stage, in addition, can hold a choir of 300 voices. There are also a gymnasium 25ft. by 50ft., library room 25ft. by 22ft., a lecture hall 40ft. by 21ft., and numerous club and committee rooms. In the basement is a swimming bath 55ft. by 18ft., lined throughout with white glazed bricks; here are also four plunge baths, a shower bath, dressing boxes, and lavatories.

**Netherfield.**—A Baptist Chapel which will seat about 350 persons is to be erected at Netherfield. The memorial stones were laid recently. The new chapel will be some 55ft. in length by 41ft. in width, and will be built in the Gothic style, with red bricks and Hollington stone dressings. The architect is Mr. W. H. Higginbottom, of Nottingham, and the brickwork will be carried out by Mr. J. Lewin, of Netherfield. The main front will face Kenrick Street, whilst the side approach will be from Chandos Street.

**Newcastle-on-Tyne.**—The North of England Temperance League have decided to establish a Northern Temperance Institute in Newcastle-on-Tyne. Mr. Guy Wilfrid Hayler, architect, London, has prepared plans of a building, near the Central Railway Station,

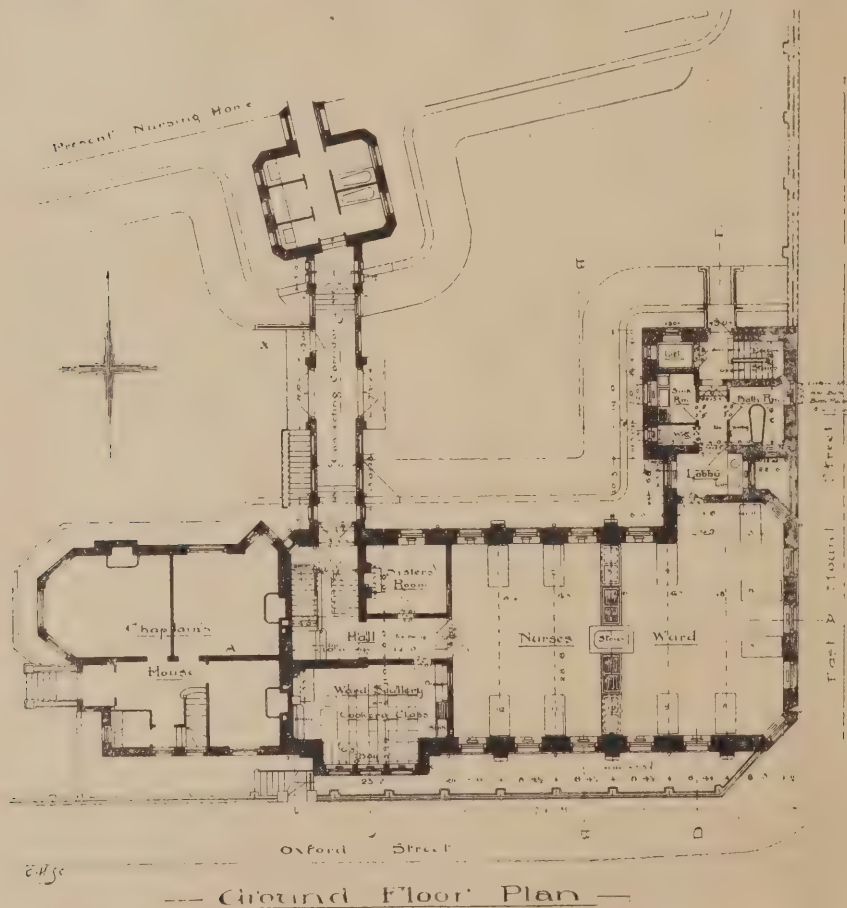

block of accessory rooms to the north-east end of the present long corridor, and extends in a south-easterly direction along the Postern Street frontage. The position chosen for the point of connection involves the rearrangement and displacement of the existing staircase, and the new wards will be reached by a corridor 81ft. long, placed at right angles to the present corridor. The upper basement is divided into four rooms for servants, and the lower basement provides accommodation for the staff of hospital porters. Each of the circular wards on the upper floors contains room for eighteen beds, and the space will be sufficient to afford each 1800 cubic feet of air. The diameter of the wards will be 60ft. externally, and 55ft. 6in. internally, the walls being about 2ft. thick. The new block contains on every floor a bathroom for patients, sanitary accommodation for nurses and patients, kept distinct, a housemaid's closet, and a room for clinical investigation. The wards are in communication with the main building by means of several bridges. The walls of the new building will be constructed and generally faced with brickwork relieved in the strings, dressings, and cornice with Ancaster stone. Internally it will be lined with glazed bricks. All the floors will be fireproof—made of steel joists encased in concrete, and covered, in the case of the ward floors, with teak. The corridors will be in marble terrazzo. The chimney shaft, which rises up the centre of the wards, will serve not only for the smoke flues but also for ventilation.

**Pitlochry.**—A new public hall is to be erected at Pitlochry, at a cost of about £2,500 from plans by Mr. Alexander Ness, architect of Nethergate. The foundation stone was laid recently by Sir A. Muir Mackenzie of Delvine Bart. The hall is being built on a site near the Pitlochry Established Church. It is built of stone, and is an adaptation of the Scottish Renaissance style. The front wing measures 55ft. in length. In the front portion of the building there is a spacious vestibule with cloakrooms and crush lobby on the ground floor, with a small hall and other accommodation on the floor above, whilst the hall proper abuts on it at an angle. The hall proper measures 60ft. by 33ft. 6in., the height being 24ft., and it will contain seating accommodation for 500 persons, the gallery to hold about 90. A stage, 25ft. long by 14ft. broad will be provided, with all the necessary adjuncts in the way of dressing-rooms, retiring rooms, and baggage rooms.

**Selly Oak.**—At a meeting of the King Norton Board of Guardians, last Wednesday the question of providing additional accommodation at the workhouse was discussed. The report of the Building Sub-committee recommended that the following alterations and extensions be made by the Board: Provision of general stores, with office accommodation attached; provision of receiving wards, and stores for inmates' clothing; removal of present coach-house, stables, and piggeries, and erection of same on a suitable site, together with wood-chopping sheds for convalescent patients, and workshops for carpenter, tailor and shoemaker; renovation of isolation hospital. The opinion was expressed that the alterations and extensions would cost about £30,000. The report was adopted. A resolution was proposed and carried empowering the Board to engage the services of Messrs. Whitwell and Son, architects, to confer with the House Committee and prepare a comprehensive report, with plans and separate estimates, for the consideration of the Board.

**Carnegie Home,** an extension of Montreal Asylum, was formally opened on Whit Monday. The building and furnishings have cost about £20,000.

**The opening of Tamworth Castle,** Staffordshire, to the public, took place on Whit Sun Monday. The castle was purchased by the Corporation of Tamworth, at a cost of £3,000, in commemoration of the Queen's Diamond Jubilee.

LONDON HOSPITAL: EXTENSION OF NURSES' HOME. ROWLAND PLUMBE, F.R.I.B.A., ARCHITECT.

breakfast-room, sitting-room and library, are in the old nurses' house, and are approached on the first and second floors by a bridge, and on the ground floor by a covered way. The exterior of the hospital is of the simplest character, and built of ordinary stock bricks with pilasters and cornice, and some few dressings in red brick. The building was carried out from the designs and under the superintendence of Mr. Roland Plumbé, F.R.I.B.A., of 13, Fitzroy Square. Mr. Shepherd, of the Borough, was the contractor, and Mr. J. A. Thornhill, resident surveyor to the hospital, acted as clerk of works.

**Mountain Ash.**—An institute has been erected from plans by Mr. D. Lloyd, of Aberbeeg, at a cost of about £7,500. The building includes a public hall 92ft. long by 62ft. wide,

suitable for conversion to such a purpose. It is proposed to open a Temperance Literature Depot, offices for the North of England Temperance League, reading room and reference library of works dealing with the liquor question. Offices for other temperance organisations will be provided, and club rooms for temperance, trade, friendly, and social societies, and for dinners, teas, &c. A large hall adjoining the building can be approached from the proposed institute.

**Nottingham.**—A new wing, the plans of which have been prepared by Messrs. A. Waterhouse and Son, is being added to the Nottingham General Hospital in commemoration of the Queen's Diamond Jubilee. The main feature of the new block—a series of circular wards one above the other—is attached by a

# Keystones.

**Rosa Bonheur**, the famous animal painter, died at Fontainebleau last Friday at the age of seventy-nine.

**A new Science and Art School** was opened a short time ago at Helston. It is the gift of Mr. Passmore Edwards, and has cost about £1,600.

**A New Town Hall at Ilford** is to be erected at a cost of over £25,000 from designs by Mr. B. Woollard, architect, of Finsbury-circus, London, E.C.

**A new Park Observatory** is to be erected at Oldham in commemoration of the Queen's Diamond Jubilee. The plans show a building of Oriental design, the cost of which is estimated at £600.

**One of the Organ Builders' Tricks.**—While the Hackney Roman Catholic Church was in course of redecoration, it was discovered that thirty-six yards of brown paper tubing had been used in the church organ in place of the ordinary metal.

**A Portrait of Cowper** in oils has been discovered at the ancient hostelry, called the Swan, at Berkhamstead, which is undergoing restoration. The hotel is over two centuries old, and much of the carved oak furniture now in use is considerably over a hundred years old.

**A Children's Ward** has been opened at the West Cornwall Women's Hospital, Redruth. The ward has been built at the south of the hospital and in communication with it. The architect was Mr. Sampson Hill, of Redruth, and the cost of the erection was about £580.

**The Parish Church of Eyke**, East Suffolk, has been opened, after restoration by Mr. A. J. Kersey, of Great Bealings. The chancel walls have been under-pinned, the nave repaired, the Communion space retiled, and a spire erected on the north side of the nave.

**The Guild of Handicraft, Ltd.**—The members of this guild have opened a small gallery at 16, Brook Street, Bond Street, London, W., where examples of the work executed at their workshops at Essex House, Mile End Road, London, E., may be seen. The guild was started some ten or more years ago with the object of encouraging good craftsmanship.

**The Tribunal of Appeal.**—The rebuilding of the premises of the Surveyors' Institution in Great George Street being now complete, the offices of the Tribunal of Appeal, established under the London Building Act, 1894, have been removed from the temporary premises in Savoy Hill to these new premises. All communications to the Tribunal should now be addressed to the Clerk to the Tribunal of Appeal, London Building Act, 1894, 13, Great George Street, Westminster, S.W.

**A Monument to President Carnot** was unveiled by President Loubet at Dijon. The monument stands in the Place de la République, and consists of a tall rectangular pyramid, on the principal face of which is an upright statue of President Carnot in marble. The President is supported by the tricolour flag, and has his right hand extended. On the sides of the pyramid is a seated figure, that to the left representing the grief of the province of Bourgogne, that on the right representing History engraving the name of Carnot.

**The Preservation of Antiquities in Germany.**—The German Emperor, during a visit to the Saalburg, near Homburg, sanctioned the final arrangements for converting the building into a museum for the preservation of Roman antiquities found on or near the Rhine, the huge wall which was erected on the German frontier by the Romans to guard against inroads from Germany. The Emperor has already given 40,000 marks for the restoration of the Porta Decumana and the adjacent walls; but about 350,000 marks more are required for the restoration of the whole wall.

# New Companies.

## The St. George's Cross Property Company, Limited.

This company has been registered, with a capital of £3,500 in £10 shares, with the object of purchasing Nos. 270 to 290, New City Road, Glasgow, and to reconstruct, rebuild, or alter any buildings belonging to the company. The registered office is, 58, St. Vincent Street, Glasgow.

## Broughton Moor Quarries Development Company, Limited.

This company was registered on May 17th by Messrs. Jordan and Sons, Limited, of 120, Chancery Lane, London, W.C., with a capital of £7,000 in £1 shares. Its object is to acquire and carry on the business of slate miners and manufacturers and slate and stone merchants, to be carried on as the Broughton Moor Slate Quarries Syndicate, at Broughton Moor, Lancashire. The first directors—to number not less than three nor more than four—are W. Lennard, J. Calvert, and J. W. Leeming. Qualification, £500. Remuneration as the company may decide. Registered office: 18, Northgate, Darlington.

## Birmingham City Properties Company, Limited.

This company was registered on May 10th by Waterlow and Sons, Limited, of Birchinn Lane, London, E.C., with a capital of £20,000 in £1 shares. Its object is to acquire and traffic in land and house and other property, and to carry on the business of financiers, capitalists, builders, merchants, &c. The first directors—to number not less than three nor more than seven—are to be nominated by the subscribers. Qualification, £150. Remuneration as the company may decide. Registered office, 33, Newhall Street, Birmingham.

## Austro-Hungarian Luxfer Prism Syndicate, Limited.

This company was registered on May 10th by Ashurst and Co., of 17, Throgmorton Avenue, London, E.C., with a capital of £25,000 in £1 shares. Its object is to enter into an agreement with the General Luxfer Prism Company, and to acquire, own, and work the right to use any invention relating to Luxfer prisms, prismatic glass for windows or side walks, glass, prismatic lights, &c. The first directors—to number not less than three nor more than five—are to be nominated by the subscribers. Qualification, £100. Remuneration as the company may decide.

## Callas, Son, and May, Limited.

Messrs. A. H. Atkins Limited, of 23, Bouverie Street, London, E.C., registered this company on May 17th, with a capital of £24,000, in £1 shares. The object of the company is to acquire and carry on the business of a furnishing and general ironmonger, gas and hot water fitter, sanitary engineer, bellhanger, plumber, &c, carried on by A. Callas, at 70, 72, 74, and 76, Oxford Road, Reading. The first directors—to number not less than three nor more than eight—are A. Callas, H. W. Callas, G. F. Callas, and T. May. Qualification, £250. Remuneration, £1,250 per annum, divisible, when less than 7½ per cent per annum is paid, and £1,500 per annum when more than 7½ per cent. is paid.

## Birmingham City Properties Company Limited.

This company was registered on May 10th, with a capital of £20,000 in £1 shares, to purchase for investment or resale and to traffic in land and house and other property, and to carry on the business of capitalists, financiers, builders, contractors, dealers in stone, sand, lime, bricks, timber, hardware, and other building materials, brick, tile, and terra-cotta makers, house and estate agents, &c. The first subscribers (each with one share) are: Joseph Green, 167, Great Colmore Street, Birmingham, builder; Thomas Fellows, 31, Buck Street, Birmingham, decorator;

Frederick Marsh, 88, Upper Sutton Street, Aston, house agent; Eustace Bayers, 29, City Road, Birmingham, clerk; Samuel E. James, 6½, Colleshill Street, Birmingham, basket manufacturer; Howard Cant, 33, Newhall Street, Birmingham, solicitor; Herbert J. Cheattle, 33, Newhall Street, Birmingham, solicitor. The first directors (to number not less than three nor more than seven) are to be nominated by the subscribers. Qualification £150. Remuneration, as the company may decide. Registered office, 33, Newhall Street, Birmingham.

## General Luxfer Prism Company, Limited.

This company was registered on May 17th by Ashurst and Co., of 17, Throgmorton Avenue, London, E.C., with a capital of £200,000 in £1 shares. Its object is to adopt an agreement made between the General Luxfer Prism Company of the one part and this company of the other part, for the acquisition of the rights to use any invention in relation to Luxfer prisms, prismatic glass for windows or side-walks, prisms of all kinds, glass, prismatic lights, electro glazing, and other means or processes for joining, uniting, framing, and mounting prisms, glass sections and tiles, and machines, apparatus, devices, moulds, methods, and processes for the manufacture of glass or prisms, and any secret or other information relating to any such method or process, and generally any invention, method, or process which may seem to the company capable of being profitably dealt with; to acquire and turn to account any real or personal property, patents, patent rights, &c. The first subscribers (each one share) are J. McEwen, E. T. Church, E. A. Wood, T. A. Vitali, J. Hindley, A. Mawson, and J. M. Lickford. The first directors—of whom there shall not be less than three nor more than five—are to be elected by the signatories. Qualification, £100. Remuneration to be fixed by the company.

# CANADIAN NOTES.

## I.—THE MARKET FOR BUILDING MATERIALS.

By J. RAWSON GARDINER, of Montreal.

CANADA being the largest as well as the nearest of the British Colonies, holds, or at least should hold, the first place in the interest of all residents in the Motherland, both from a commercial and a sentimental standpoint. It is therefore a matter of serious import, especially to the British manufacturer, that in the same ratio as the Canadian market grows do the imports from the United States grow. But this cannot be said with goods from the British Isles. It is a stubborn fact that Americans are undoubtedly pushing ahead of their British competitors in the Canadian market, and this in the face of a reduction of duties in favour of British goods. It ought to be the object of every British subject to find out the cause of this and to see wherein it can be changed. The American worker—be he manufacturer or agent—if asked what three things have contributed to his success would probably reply, firstly, push! secondly, push!! and thirdly, push!!! It is this almost unceasing "push" that is undoubtedly forcing American goods to the fore the world over. If something is not done by the English to stem the tide it will not be long before Americans will have wrested the commercial supremacy of the world from the British, even though they have held it so long. Is it not more loyal and true to point out wherein the danger lies, and do all in one's power to prevent it, than to hide our eyes to the fact?

In the first place, then, let us look at the size of this Canadian market. The Dominion contains a population of over 5½ millions distributed in the several provinces, as far as can be ascertained, as follows:—

Province.	Population.
Ontario ... ..	2,500,000
Quebec ... ..	1,700,000
Nova Scotia ... ..	500,000
New Brunswick ... ..	325,000
Prince Edward Island ... ..	110,000
Manitoba ... ..	200,000
North West Territories ... ..	125,000
British Columbia ... ..	150,000
	5,610,000

These figures show somewhat how the market is distributed as to provinces, and the following table shows the chief cities, and the province in which they are situated, with the population of each:

City.	Province	Population.
1. Montreal in	Quebec .....	300,000
2. Toronto "	Ontario .....	200,000
3. Quebec "	Quebec .....	65,000
4. Hamilton "	Ontario .....	50,000
5. Ottawa "	Ontario .....	50,000
6. Halifax "	Nova Scotia ...	40,000
7. Winnipeg "	Manitoba .....	30,000
8. Vancouver "	British Colum-	40,000
(including Victoria) bia		

Together with the above tables let us take up the amount of buildings erected in these eight cities, and one ought to be able to form a fair idea of the market for building materials. First of all then let us take:—

1. *Montreal.*—Montreal, in the metropolis of Canada, is situated at the head of ocean navigation on the St. Lawrence River. This constitutes it the distributing point of all European imports. It is the wealthiest city in Canada, and it is here that a large proportion of the manufacturing, and the largest wholesale houses are situated. It is largely a commercial city. The population is three-fifths French-Canadian, a large number of Scotch, and a sprinkling of English, Irish, and nearly every other nationality. The buildings erected during 1898 amounted in value to some 2,500,000dols. Among these may be mentioned a fine buff-sandstone five-storey office-building for the London and Lancashire Insurance Co., in the French Renaissance style; a new building for chemistry and mining at McGill College

University; an extensive wing to the Grey Nunnery, costing 60,000dols.; a wing to the Victoria Hospital; a new theatre; and a nail factory and rolling mill, costing 25,000dols. Besides these buildings there were over 700 houses erected, many of them costly and well designed residences, and some thirty stores. Work during 1898 was slightly better than in the previous year, and prospects for the present year, as far as can be seen at this date, are bright.

2. *Toronto.*—This city is largely English speaking in contradistinction to Montreal. This, together with the fact that the surrounding towns and villages are more prosperous, makes the province, as a whole, in many ways more satisfactory from a commercial point of view. The buildings erected in 1898 were valued at 1,700,000dols., which is a large increase over the previous year and larger than in any year since 1892. This is very satisfactory as Toronto has suffered severely from the building boom, from which it had hardly yet recovered. The increase was in every branch of buildings, especially houses, factories, and warehouses.

3. *Quebec.*—The population of this city is nearly all French-Canadian, and commerce from this port has not been on the increase. The building operations were not extensive, only amounting to some half million dollars. Among the buildings erected may be mentioned the large wing to the hotel "Chateau Frontenac," which cost 150,000dols, a building for Y.M.C.A., costing 20,000dols., and a telephone exchange building, erected by the Bell Telephone Co., costing some 20,000dols. The lumber industry is the chief surviving one in this locality, and the surrounding country, from a commercial standpoint, need not be considered, as the villages are small and very much scattered.

4. *Hamilton.*—This is a bright go-ahead Ontario town, doing a building trade last year of some 500,000dols., distributed as follows:—

	Dols.
Dwellings.....	210,000
Alterations .....	40,000
Factories and Stores .....	200,000

The future for the building trade in this town is fairly bright.

5. *Ottawa.*—This city is the capital of the Dominion, and it is here that the stately Parliament Buildings are situated. The city has been chiefly centred round Parliament and the members, but of late years quite a large amount of business has sprung up, and at last Ottawa seems to show signs of going ahead commercially. Building operations last year amounted to about 650,000dols.

6. *Halifax.*—This town is largely noted as a military and a naval station, though there is quite a large amount of trade transacted here as well. Building operations, however, were not so active as usual last year, only some 600,000dols. being expended. A large proportion of the residences here are built of wood, which tends to give the town far from a bold appearance.

7. *Winnipeg.*—This city, situated as it is in nearly the centre of the Dominion, is the distributing point of nearly all the Manitoba and western grain. The city has been growing rapidly of late, but it is still suffering from the last land "boom." Building operations last year amounted in value to 500,000dols., but the building trades cannot be called brisk, though prospects for this year seem somewhat brighter, as the harvests for the past three years have been good and farmers have been able to obtain good prices. This is sure to tell favourably on the cities and towns very shortly. The large seven-storey hotel "The Manitoba," which has recently been burned to the ground, will probably be rebuilt this year.

8. *Vancouver.*—This Western city, situated on the Pacific coast, has been having quite a "boom" the last two years. It is to a large extent the distributing point of the mining districts, both at the "Klondyke" and at Rossland. The building operations in 1898 were far larger than ever before in the history of the city, and new buildings for the year were valued at 1,500,000dols. Among the most important may be cited: The new C.P.R. Station Buildings, a five-storey office building for "The Molson's

Bank" costing 100,000dols., and a fine structure for the "Imperial Bank." Prices of material ruled high and wages were steady, though sufficient labour is said to be in the market to meet local requirements. Rents are said to rule steady and remain high, as buildings are said still to be required both as houses and stores; but the question is, Will this last? The Provincial Government Buildings at the Post Office at Victoria were both finished last year. The Parliament Buildings are a stately block, by Mr. T. M. Rattenbury, have been erected at considerable cost. Otherwise building in this town has not been very bright.

It is hoped that these notes on Canada will give the British contractor, manufacturer, and working man some idea of the field on the side of the Atlantic, and enable them there to gauge somewhat of its possibilities.

## THE DISPUTE IN THE BUILDING TRADES.

AFTER the decision come to at the meeting of the master builders in Birmingham little peace might have been expected. Just as everyone was looking forward to a quiet period a somewhat sensational development took place in connection with the disagreement between the Leeds Federation of Master Builders and their employes. Acting on instructions received from the Executive Committee sitting in London, the members of the local branch of the London Order of Bricklayers decided on May 20th, at a meeting specially convened, to cease work forthwith in all cases where the masters have locked out 25 per cent. of their men. The men do not expect any good from yesterday's conference between the masters and the operatives in the allied trades, and they have also lost entire confidence in the Yorkshire Federation since the latter, upon its own initiative, locked out 25 per cent. of their men in sympathy with the Hull masters. They have refused to resume work except upon two conditions. The first of these is that their demand for an increase of wage at the rate of a penny an hour shall be complied with; and the second is that there shall be an alteration in the rule relating to apprentices. When the Manchester Unity Bricklayers heard of this step they described it as a suicidal policy of which they did not approve; other operatives engaged in the building trades in Leeds expressed the same opinion.

The Yorkshire Master Builders' Federation at a meeting held in Hull last Wednesday decided to make the lock-out of 25 per cent. of the men effective, and to take no further action until after the conference between the representatives of the National Association and the delegates of the allied building trades' unions.

At a meeting of the Scarborough Master Builders' Association on Saturday night it was decided that the resolution of May 3rd be carried into effect on May 31st, and that nine and a half hours' notice be given to 25 per cent. of the union men in each branch of the building trade in Scarborough. The Yorkshire Federation asked the Scarborough masters to lock out 25 per cent. on May 6th. The reply was that they could not see their way to do that, but they would agree to lock out on June 1st. The decision of the employers is a serious matter for the town, as a great deal of building is going on at present, plans having recently been passed for about 800 houses.

The conference between the Master Builders' Association and the Plasterers' Union was held yesterday at the Salisbury Hotel, Salisbury Square, Fleet Street, London E.C. The employers were represented by Alderman Holdsworth (Bradford), Messrs. B. J. Greenwood and Ryden (London), James Higson (Salford), G. Nichols (Leicester), and J. Sudgen (Bradford). The men's representatives were Messrs. M. Deller, D. Hennessey, Mark Jones (London), H. Duckett (Birmingham), George Jackson (Manchester), and A. McLeod (Newcastle). The meeting was held too late for us to publish this week a report o

As a result, but Mr. Deller stated that the following was the basis agreed upon for discussion:—

As regards clause 1 of the employers' manifesto compelling foremen to join the union, it is to be understood that the vote of the Plasterers' Association in February against the practice settles the point.

With regard to the question of apprentices, different practices prevail in different districts, the question shall be referred to special joint committees of both sides to draw up working rules to govern the matter. In reference to the clause dealing with boycotting, it is to be understood that while not admitting the accuracy of these allegations the Plasterers' Association will give an undertaking that no such boycott or blacklisting shall take place in future where the firms adhere to the rules mutually agreed upon. The employers, on the other hand, give a definite undertaking that such rules as are mutually agreed upon shall be strictly enforced in all parts of their contracts.

In reference to the question of demarcation it is proposed that joint committees shall be established in different districts, equally representative of the masters and men, who will draw up schedules of the work which it is recognised belongs to certain branches of the trade.

With regard to the clauses which speak of the refusal to work on buildings where some of the workmen employed may not belong to a trade union, and of the objection to submit all trade disputes to discussion at a conference between employers and employed, with a view to arrive at an amicable settlement prior to any strike or withdrawal of workmen, it is agreed that in the event of a dispute arising on any job or works the district officials of the National Association of Operative Plasterers shall send a written notice to the local Association of Master Builders, who shall inform them whether the said builder is a member of that body. If so, a strike shall not be sanctioned by the union until six clear working days have expired from the receipt of such notice, during which time the matter shall be considered by the employers and the representatives of the workmen, with a view to an amicable settlement. Failing a local settlement, reference shall immediately be made to the central joint committee of the two associations.

### The Enlargement of Waterloo Station.

Particulars of the revised plan for enlarging Waterloo Station show that the total area of the station is to be increased from 15½ acres to 23 acres. Four additional platforms are to be erected, permitting the approach of trains from seven new lines.

Bolton Stonemasons have demanded a penny per hour advance, and certain alterations in working rules. The masters held a meeting last week to consider the matter, and, in order to avoid a strike, offered a halfpenny per hour increase, which would make the men's remuneration 9½d. This was refused by the operatives, and the employers have now withdrawn their offer, and are determined to resist the men's demands.

Wakefield Joiners went on strike because their masters refused to accede to their demands to sign a code of working rules. They have decided to approach the employers, with a view to a settlement, and have sent a circular to each of them asking the following question: "Providing the clause relating to piece work is expunged from the rules, are you prepared to sign them; if not, are you in favour of the dispute being submitted to the Wakefield Board of Conciliation, and to abide by their decision?"

Paisley Labourers on Strike.—In Johnstone all the labourers in the building trades went out for an increase of a halfpenny per hour, which would make their wages 6d. per hour. Only one master conceded the demand. The Masters' Federation, comprising Paisley, Johnstone, Renfrew, and Barhead builders, met and decided to lock out their men if the Johnstone men did not return to work. As the men still held out this was done, and there are about 200 men locked out.

## CAST IRON BEAMS.

IN this article the formulæ for cast iron beams will be considered. In modern work, cast iron is now very rarely used; that is, as a girder. But still some knowledge of its strength is advisable to every student.

The strength of a cast iron bar 1" × 1" × 12" is 2100lb. That is the weight at which it breaks. Then, if cast iron were used in the form of bars, it would be merely a matter of simple proportion to obtain their respective strengths—under the same rules with regard to breadth, depth, and span, as those which apply to wooden beams. But as cast iron is not used as a bar, but a girder, a few preliminary remarks about its proportions will be necessary. The depth should vary according to circumstances from a minimum of  $\frac{1}{20}$ th of the span, to a maximum of  $\frac{1}{15}$ th. The sectional area of the bottom flange should be about six times that of the top. The reason of this is that cast iron is much stronger under compression than under tension, therefore requiring more material to resist the latter stress.

The ultimate or breaking strains of average good cast iron are: Compression, 48 tons per square inch of sectional area; tension, 9 tons ditto. Cast iron being a very uncertain material, liable to defects in the casting, &c., a high factor of safety (either 5 or 6) is always taken. Therefore working stresses of 8 tons

under compression, and 1½ tons under tension are obtained.

The formula for a cast iron girder is  $W = 2 \frac{a d}{l}$

$W$  = Breaking weight in tons in the middle.

$d$  = Depth of girder in inches.

$a$  = Sectional area of bottom flange in inches.

$l$  = Span in feet.

It will be observed in the formula, that the top flange is ignored, its size being obtained from the lower one, according to the rule previously mentioned.

One or two examples will now be given.

What concentrated load will the girder of the section shown in Fig. 1 safely carry? Span 16ft.

$$W = 2 \frac{a d}{l}$$

Bottom flange ( $a$ ) is  $8'' \times 1\frac{1}{2}'' = 12$  sq. in.

$$\text{Then } W = 2 \frac{12 \times 12}{16}$$

$$W = \frac{2 \times 12 \times 12}{16} = 18 \text{ tons.}$$

But this is the breaking weight. Then using 6 as a factor of safety, the answer is  $18 \div 6 = 3$  tons.

Next to reverse the case, and calculate the size of a girder to carry a given load. Here is a question once actually set:—

A cast iron girder has to carry a load of 12 cwt. per foot run of its length, including its own weight. Its length is 24ft. from centre to centre of bearings. Its depth is to be 16". Calculate its dimensions, and give a dimensioned section.

Total weight,  $12 \times 24 = 288$  cwt.

But this being distributed, load =  $14\frac{1}{2}$  cwt., or 7½ tons concentrated load.

Using 5 as a factor of safety:  $7\frac{1}{2} \times 5 = 36$  tons, the breaking weight.

Then a girder 16" deep is required, to break at a load of 36 tons in the centre, the span being 24ft.

$$W = 2 \frac{a d}{l}$$

$$36 = 2 \frac{a \cdot 16}{24}$$

$$36 = \frac{2 a \cdot 2}{3} = \frac{4 a}{3}$$

$$A = \frac{36 \times 3}{4} \text{ or } 27 \text{ sq. in.}$$

This, then, is the area of the bottom flange. A flange  $13\frac{1}{2}''$  wide × 2" thick would provide this area, while the top flange should be  $27 \div 6 = 4\frac{1}{2}$  sq. in., or, say,  $4\frac{1}{2}''$  wide × 1" thick. The girder then would be as Fig. 2.

It will be noticed that the lower flange is rather wide compared to the depth. This, of course, is unavoidable, owing to the depth being limited, and being rather shallow when the length of the span is considered.

If in such a question no depth were given, one would have to be assumed, and then the area calculated as shown. Should this result in a badly proportioned girder, the depth would have to be assumed afresh, and the calculation worked out over again, until a girder of good proportions was obtained. The formula used in the above is that supplied by Hurst, in the "Architectural Surveyor's Handbook."

Occasionally, cast iron girders were made with the top curved, called the hog-back girder, or, again, sometimes with the lower flange curved on plan. Thus, the amount of metal at each point was proportioned to the stress at that point, there being practically no extra labour involved in making the girders so, and material being saved.

Cast iron girders 12in. or more in depth should have stiffening feathers introduced about every 5ft. along the web.

## Masters and Men.

The Edinburgh and Leith Joiners are still on strike.

Some of the Edinburgh and Leith Plumbers are still on strike. The total number of masters who have granted the advance of wages is forty-four.

Glasgow Joiners struck for an advance of ½d. per hour on their wages, which were 9½d. per hour. They also demanded that the masters should sign the men's working regulations, which guarantee a wage of 10d. per hour for one year. The masters have fallen in with the men's desires.

The Building Trade of Norwich.—At a meeting of the Navvies, Bricklayers' Labourers, and General Labourers' Union last Thursday, the following resolution was unanimously passed: "That this meeting of builders' labourers accepts the offer of the master builders to pay 5d. per hour on and after June 1st next, and desires to express its thanks for the courtesy of the employers throughout the negotiations."

Great Lock-out in Denmark.—A lock-out of all the industries connected with the iron and building trades of Denmark began last Wednesday all over the country. The trouble began at Copenhagen in a dispute regarding joiners' wages. As negotiations for a settlement led to no result, the Employers' Union decided to extend the stoppage so as to embrace the joiners, carpenters, masons, painters, tinsmiths, and iron-workers. At the same time the lime-burners and the brick and tile manufacturers were instructed to deliver no goods while the stoppage continued, and the Executive Committee of the Employers' Union was authorised to still further extend the dispute should such a step be deemed necessary.

## Builders' Notes.

**The New Infirmary, Basingstoke,** is being warmed and ventilated by means of Shorland's patent Manchester Grates, supplied by Messrs. E. H. Shorland and Brother, of Manchester.

**An Arbitration Case.**—The sum of £2,500 was claimed by the Paisley Road Trustees of Messrs. Forrest and Brownlee, timber merchants, of Glasgow, as compensation for setting back their property on the south side of High Street, known as Townhead Terrace. Sheriff Lees, who acted as arbiter, assessed the compensation at £750. His valuation was 45½ square yards at £6 per square yard, which, with ten per cent. added for compulsory sale, was £300 6s. The balance of the sum awarded was his estimate of the damage caused to claimants in the utilisation of the remaining ground by the loss of this front portion.

**Dispute between an Architect and a Builder.**—A case was heard at the Wolverhampton County Court, before Mr. Morton Brown, in which Messrs. Manton and Son, architects, of Darlington Street, sought to recover £23 18s. 9d. from Mr. Philip Bowater, builder, for work done in respect of some houses at Gorsebrook, and there was a counter claim for £22 8s., which was said to be money paid and lent to the plaintiffs. The plaintiffs had prepared the plans for some houses which a man named Hickman was about to build at Gorsebrook. The defendant was the builder, and the case hinged on the question whether the defendant had contracted to pay the money, not for Hickman, but for himself.—After hearing several witnesses, his Honour found for the plaintiffs on the main issue, and decided that the amount to be paid should be settled by a practical man; the counter-claim to be deferred to see if credit had been given.

**Severe Judicial Criticism of the Workmen's Compensation Act.**—In the City of London Court, last week, Deputy Judge Pitt-Lewis, Q.C., delivered a judgment in the first Workmen's Compensation Act case that has been heard in the City. Frederick Martin, labourer, claimed compensation for personal injuries suffered whilst in the service of the London and India Docks Joint Committee, of Leadenhall-street, London, E.C. Martin worked for the defendants for a day and a half only as a labourer at their warehouse in Cutler-street, Houndsditch, close to the fanlight near the roof, when the plank on which he was standing gave way, precipitating him to the ground. His jaw was fractured and he was otherwise seriously hurt.—The defendants denied that their "warehouse," where the accident happened, was a "factory" within the meaning of the Act, and therefore the plaintiff could recover nothing. But if he was entitled to any damages, then it must be assumed, they urged, that the basis of his earnings per week was the sum of 7s. 3d. which he earned during the day and a half that he worked for the defendants, and not 30s. a week, as was suggested he had been in the habit of earning. The deputy judge said if the plaintiff had been entitled to recover anything it would, he feared, have had to be based on the 7s. 3d. and not the 30s.; but the plaintiff was not entitled to anything. The place where he worked was not a warehouse within the true sense of the word, according to his reading of the Act, which was an extraordinary tangle of legislation. The statute seemed to have been drawn by a person who had strayed into the land of topsy-turvydom, and there acted upon his recollection of the great composition, "The House that Jack Built," but also with the disadvantage of not knowing what he meant. The draughtsman of the Act had left the judges to guess at what was meant. There must be judgment for the defendant company with costs, but execution would be stayed, as he hoped there would be an appeal.

## Engineering Notes.

**The cost of the Nicaragua Canal** is estimated at 125,000,000dol. by the Nicaragua Canal Commission.

**A Big Order for America.**—The Phoenix Bridge Co., of Phoenixville, Pa., have received the contract from the Japanese Government to build a steel bridge for the Imperial Railway of Japan.

**A big Electric Tramway Scheme** is to be carried out at Birkenhead. It will include services to New Ferry, Higher Tranmere, part of Oxtown, and the north end of the town. The total cost is set down at over £208,000.

**Castle Martin Church.**—The heating having been very unsatisfactory for a long time, it was decided to place the matter in the hands of the specialists, John King, Limited, engineers, Liverpool, who recommended that the old apparatus be entirely removed, and that the church be fitted with their latest improved hot water heating apparatus, employing their well-known special economical coil heater, with water-way fire bars. This has now been carried out with the best results.

**The Lighting of Kingswood.**—The Local Government Board have sanctioned the loan of £1,200, for the purchase and erection of pillars and lamps. A dispute between the Urban District Council and the Western Counties Electric Light and Power Syndicate has been satisfactorily settled. The claim of the syndicate was for £500 as damages for breach of contract and £89 for light supplied. A counter-claim was entered by the council because of the sudden stoppage of the light, and the case has been met by the council paying £30 to clear themselves from all claim for lighting, &c.

**The New Pier at Brighton,** which has been erected opposite the Aquarium, was opened recently by the Mayoress. At present it is incomplete, the pavilion having still to be built, but the portion opened to the public extends some 1500ft. from the beach, and several smaller pavilions have been put up. The arrangements have been designed to resemble the kursaals on the Continent, including reading-rooms and dining-rooms, ornamental arches for electrical illumination purposes, and an electric tram up the centre of the pier. There are to be landing stages at the head of the pier to accommodate vessels in different positions. The entire structure covers an area of 2½ acres, and eighty-five miles of planking and decking have been employed in its construction. The work is being carried out under the superintendence of Mr. John Howard and Mr. E. St. George Moore.

**A New System of Gas Lighting.**—An interesting exhibition of the Tomzee-Greyson system of gas lighting was given in the Bradford Corporation Gas-Stove Department recently. Several members of the Bradford Corporation Gas and Electricity Committee were present, and much interest was shown in the proceedings. The essential point of the system is that the gas is compressed before entering the burner by means of mechanical apparatus fixed to the water supply, or in some other way, and the maximum pressure is 7½ atmospheres. This compressed gas is allowed to flow through an injector, and in that way, it is claimed, automatically mixes itself with the proper quantity of air. The mixture of gases is then burnt in the ordinary way with a Welsbach incandescent burner of large size, which is claimed to give forth a light equal in effect to that of an electric arc lamp. No chimney is required. The power required for working this apparatus is said to be insignificant, only amounting in cost to one farthing per 1000ft. of gas consumed. The system has been brought into public notice by a syndicate, of which Mr. H. Illingworth is the Yorkshire manager.

## Surveying and Sanitary Notes.

**Excavation Case at Morecambe.**—A case came before the Palatine Chancery Court, sitting at Liverpool on May 19th, in which Mr. Mansfield, on behalf of the District Council of Morecambe, applied to the Vice-Chancellor for an order to restrain Mr. Escombe, their contractor for laying a water main along the principal thoroughfare of Morecambe, from proceeding further with the excavation between May 19th and June 2nd, and also requiring him to fill up the present excavation. He pointed out that the contract provided for a suspension of the work at the Council's discretion. Mr. Maberly, for the defendant, said he agreed not to proceed with the excavation, but he declined to fill up, as the excavation in that case would have to be re-made. Mr. Mansfield said that the Council regarded the work and the state of the street as so great a nuisance during the holidays that, failing an order, they would fill it up at their own risk. The Vice-Chancellor said he could not make an order to fill up without going fully into the case. Mr. Maberly had undertaken not to proceed further with the excavation, and the Council must take their own course as to the rest.

**Insanitary Areas in Liverpool.**—In the Liverpool Municipal Buildings last Wednesday Major-General Crozier, R.E., one of the Local Government Board's inspectors, held an inquiry with reference to an application of the City Council for sanction to borrow £50,000 for the purposes of the Liverpool Sanitary Amendment Act, 1864, and £13,500 for the provision of dwellings for persons of the working classes, and for approval of the sale of certain corporate land situate in Green Lane, Lister Drive, and Brainerd Street, to the trustees of the Presbyterian Church of England (West Derby). Dealing with the application for sanction to the borrowing of £50,000, Mr. Pickmere, deputy town clerk, stated that the money was intended for the purchase and demolition of insanitary property. The houses in the groups set out in the medical officer's reports as being unfit for habitation, numbered 706, accommodating a population of 3,059. Dr. Hope (medical officer of health) said that in the houses presented sickness was always more or less prevalent, and they were a source of intense anxiety to the Health Committee. The general death-rate in those places was excessive. The houses were such as the Local Government Board had already sanctioned money to demolish, and had been removed with great benefit. They consisted of houses of three rooms one above the other, and back to back with similar property. There was no yard space, the property was arranged in courts, approached by tunnel or very narrow entrances, and there was most inadequate sanitary accommodation. Very little sunshine or air could get to the houses, and the plants in the window boxes, supplied by the Corporation to poor people, died as a consequence. The application for sanction to the sale of land at Green Lane was then proceeded with. Mr. Pickmere pointed out that the plot consisted of 4,000 square yards, bounded by Green Lane, Lister Drive, and Brainerd Street, and formed part of the Newsham Park Estate, from which it was cut off by the London and North-Western Railway Company's Bootle line. It was proposed to sell it at 7s. per yard to the trustees of the Presbyterian Church of England, the condition being that the church and hall should be erected within seven years. The last application considered was for sanction to borrow £13,500 for the provision of working-class dwellings. Mr. Pickmere said that the application concerned houses to be built to accommodate the persons displaced by the demolition of insanitary property. It was proposed to erect five four-roomed houses, eight three-roomed, and 119 two-roomed houses, making a total of 132 houses, at an estimated cost of £13,449 15s. 10d.

Trade and Craft.

SELF-KEYED WOOD BLOCKS.

Messrs. B. Ward and Co., of 15, Great George Street, London, S.W., have sent us a specimen of their patent self-keyed wood blocks for flooring. These blocks are supplied by them made from yellow deal, pitch pine, oak, maple, teak, and jarrah. Discs, disc keys, wood or metal dowels are not used in laying the blocks, but they are simply ploughed and tongued and laid in special mastic. The absence of disc keys or metal dowels is an advantage, as these little articles have an unhappy knack of getting loose or left out altogether. The flooring is supplied in a large number of designs.

HOLLIS BROS. AND CO.

The No. 2 list of mouldings, &c., which Messrs. Hollis Bros. and Co., of Leicester, have sent us, contains a large variety of new designs which are worth special notice. There are fifty plates, containing several illustrations of architraves, bay windows, beads, fillets, balusters, church benches, door frames and casings, dado panelling, mantels and over-mantels, ornamental match-boarding, &c. Attention should be paid to the "Sesame" door mouldings, which are becoming very popular. According to their price list, the ornamental match-boarding is only slightly dearer than plain matching, and it certainly looks much

better. The firm are carrying out to the letter their motto "Ars ex machinâ," and their catalogue is one of the most interesting we have received.

LINCROSTA-WALTON.

Messrs. Frederick Walton and Company, Limited, of 2, Newman Street, London, W., have sent us their splendidly illustrated catalogue of the Lincrosta-Walton decorations. This catalogue runs to nearly sixty pages, and each page contains a number of illustrations of admirably embossed reliefs. Some 200 or more designs of dados, fillings, friezes, and ceilings, are given, and about 500 illustrations of designs for dado and picture rails, borders, plaques, panels, mats, &c. These are excellently reproduced in colotype. The catalogue measures 16½ in. by 10½ in., and is neatly bound with red cloth. Very clear instructions are given in the book on the way to fix the Lincrosta-Walton.

"SALAMANDER."

The United Asbestos Co. Limited, of 158, and 160, Charing Cross Road, London, W.C., have sent us a copy of their plentifully illustrated catalogue of "Salamander" decorations. This runs to some forty pages, and contains reproductions of nearly one hundred different designs, all of which are good, and a large number beautiful. At the beginning of the catalogue three illustrations are given, showing the chief works and offices of the company. Particulars are also given as to the method of applying the decoration. On pages

eight and nine a price list will be found of the different patterns in the book. Some handsome designs of English and French Renaissance are illustrated, and the Gothic designs in very high relief are a credit to the firm. This catalogue should find a place near the hand of every architect and decorator.

P. E. CHAPPUIS AND CO.

The necessity of taking some steps to improve the natural light at the Cripplegate Institute led the committee of the Institute to experiment with a large number of daylight reflectors. Messrs Chappus and Co., of 69, Fleet Street, London, E.C., supplied the reflector which met with their approval. This firm has had much experience in the production and application of means for improving natural light. Their business has so increased in the last few years that it is estimated that over 50,000 of their daylight reflectors are fixed in London alone. Their catalogue contains some notes on the best means of making the most of daylight, and is well worth the careful perusal of any reader who has windows to which the daylight is obstructed.

Improvements at Wattstown. — New bridges are being erected over the Taff Vale Railway and the Rhondda Fach River at Pontygwaith, and a road is being made from Pontygwaith to Wattstown. The road and bridges will cost over £10,000, and are not yet completed.

## Property and Land Sales.

By EDWIN FOX and BOUSFIELD,

At the AUCTION MART.

On WEDNESDAY, JUNE 14th, at TWO o'clock.

**CRICKLEWOOD.**—An important FREEHOLD BUILDING ESTATE, most advantageously situate on the Edgware-road, adjoining the Crown public-house, and being at the corner of Child's Hill-lane, close to Child's Hill and Cricklewood station on the Midland Railway, and a station on the Electric Railway to be immediately opposite. The property comprises a detached family residence, with stables and large garden. It has a frontage to the Edgware-road of 170ft., and to Child's Hill-lane of about 300ft., and is suitable for the erection of shops, business premises, residential flats, and private houses. Possession on completion.

Particulars at the Mart; at Messrs. EDWIN FOX and BOUSFIELD'S Office, 99, Gresham-street, Bank, E.C.; and of the Vendor's Solicitor,

Mr. J. H. HORTIN,

No. 161, Edgware-road, W.

**LEYTON.**—TWO ACRES of FREEHOLD BUILDING LAND, near both Leyton Stations and the County Cricket Ground, with a frontage of 239ft. to Hainault-road, and 339ft. to Forest Road. Ripe for the immediate erection of villas, which are in great demand.

**MILE-END-ROAD, E.**—FREEHOLD BUILDING SITE, with cottages thereon known as Sampson's-court, just off main road, near Whitehorse-lane. Area 1000 square feet.

**MESSRS. C. C. and T. MOORE** will SELL by AUCTION, at the Mart, on THURSDAY, JUNE 1st, at TWO.—Auction and Estate Agency Offices, 7, Leadenhall-street, E.C., and 144, Mile-End-road, E.

**LAND SALE** in a MARQUEE on the ESTATE on THURSDAY JUNE 8th.

**CLAPHAM PARK.**—An unequalled opportunity for securing FREEHOLD VILLA SITES, so rarely to be obtained in this neighbourhood. About half a mile from Clapham-road Railway Station and the City Electric at Clapham Cross, and the Cable Tramway, Brixton-road; and close to the lovely Commons of Clapham and Tooting Bec. Free conveyances; payments by instalments.

**LINCOLN HOUSE ESTATE.**—TWENTY-EIGHT choice FREEHOLD SITES in Clarence-road and Poynders-road, each having a frontage of 60ft. and an average depth of 340ft., secluded from the road by a beautiful belt of shrubs and trees.

**SIXTY PLOTS of BUILDING LAND**, with frontages of 30ft.; depths varying from 125ft. to 165ft. Situate in Rodenhurst-road, a new thoroughfare, 50ft. wide, leading from Poynders-road to Elms-road and Clapham Common.

**MESSRS. DOUGLAS YOUNG and CO.** will SELL the above by AUCTION in a Marquee on the Estate, on THURSDAY, JUNE 8th, 1899.—Particulars and conditions of sale may be obtained of the Solicitors, Messrs. PHELPS, SEDGWICK, and BIDDLE, 22, Aldermanbury; Messrs. LINKLATER and Co., 2, Bond-court, Walbrook, E.C.; JOHN ANNAN, EDWARD DEXTER, Joint Managers, United Realisation Co., 32, Old Jewry, E.C.; or of the AUCTIONEERS, 51, Coleman-street, E.C.; 213, Clapham-road, S.W.; and Ilford, E.

**FLEET STREET, CITY.**—By order of the Governors of St. Bartholomew's Hospital.—A fine commanding Building Site, occupying an area of about 2342 sq. ft. on the south side and newly widened part of this great main thoroughfare, within about 40 yards of Ludgate-circus, having frontages of about 55ft. 6in. to Fleet-street and 51ft. 5in. to St. Bride's-avenue in the rear (facing St. Bride's Church); remarkably well lighted back and front, and suitable for the erection of first-class shops and business premises—a bank, newspaper or publishing offices, or other important buildings adapted to the position.

**MESSRS. DEBENHAM, TEWSON, FARMER, and BRIDGEWATER** are instructed to LET by AUCTION, at the MART, on TUESDAY, JUNE 13th, at TWO, on a Building Lease, for a term of 80 years direct from the Freeholders, the very compact and valuable SITE of Nos. 90, 91, and 92, Fleet-street, and 2 and 3, St. Bride's-avenue, in the City of London.

Particulars, with plans, of Messrs. WILDE, MOORE, and WIGSTON, Solicitors, 21, College-hill, Cannon-street; of Messrs. E. F. ANSON and SON, Architects and Surveyors, 7A, Laurence Pountney-hill, E.C.; at the Clerk's Office, St. Bartholomew's Hospital; and of the AUCTIONEERS, 80, Cheapside.

**CITY of LONDON.**—By order of the Drapers' Company.—An important Building Site, occupying an extremely valuable position close to the Stock Exchange and Bank of England.—Messrs.

**FAREBROTHER, ELLIS, EGERTON, BREACH, GALSORTHY, and CO.** will LET by AUCTION, at the MART, Tokenhouse-yard, E.C., on THURSDAY, JUNE 8th, 1899, at TWO o'clock precisely, on Building Lease, for a term of 80 years, the extensive SITE occupied by the premises known as No. 26, Austinfriars, Old Broad-street, containing an area of about 4,000 superficial feet, admirably adapted for the erection of a block of offices arranged to suit the requirements of stockbrokers, and for which there is the unlimited demand at highly remunerative rents. The property abuts at the rear upon the gardens of Drapers'-hall, affording unusual facilities for the free access of both light and air.

Particulars, with plan and conditions of letting, may shortly be obtained at the Clerk's Office, Drapers'-hall, E.C.; of Mr. CHARLES REILLY, F.R.I.B.A., 23, St. Swithin's-lane, E.C.; of P. A. NAIRNE, Esq., 3, Crosby-square, E.C.; at the Mart; and of Messrs. FAREBROTHER, ELLIS, and Co., 29, Fleet-street, and 18, Old Broad-street, E.C.

By EDWIN FOX and BOUSFIELD,

At the AUCTION MART,

On WEDNESDAY, JUNE 21st, at TWO o'clock.

**ENFIELD.**—Close to the centre of the town and station on the G.E. Railway, valuable FREEHOLD BUILDING ESTATE of about seven acres, with approach to the Southbury-road, and presenting much scope for profitable building operations, which have been so successful in conducting to make Enfield one of the most popular places for a medium class of house within a like distance of the City. The facility of transit which the G.E. Railway affords, contrasting as it does so favourably with that of other lines, tends to enhance the eligibility of building land in this district.

Particulars at the Mart; at Messrs. EDWIN FOX and BOUSFIELD'S Office, 99, Gresham-street, Bank, E.C.; and of the

Vendor's Solicitors, Messrs.

BARFIELD and BARFIELD,  
No. 72, Finsbury-pavement, E.C.

**THE WORSHIPFUL COMPANY of CARPENTERS.**

THE ANNUAL EXAMINATION IN CARPENTRY AND JOINERY

will be held at Carpenters' Hall, London Wall, on JUNE 14th, 15th, 16th, and 17th. Certificates and Medals are awarded to successful candidates. The last free lecture to candidates and others will be delivered at the Hall on THURSDAY, JUNE 1st, at 7.30 p.m., by PROFESSOR T. ROGER SMITH, F.R.I.B.A., on "Timber and Half-Timber Houses" and the "Decay and Preservation of Timber."

For full particulars of the Examination, apply to S. W. PRESTON, Esq., at the Hall. 1

**ANSELL and MALLOWS,** Architectural Draughtsmen and Quantity Surveyors, 21, Buckingham-street, Strand, W.C.

**R. I. B. A. EXAMS. PREPARATION,** personally or by correspondence, in three, six, nine, or twelve months' courses. Architectural Lending Library. Special three months' finishing courses.—For full particulars apply to Messrs. HOWGATE and BOND, Associates R.I.B.A., Perchar House, 70, Gower-street, W.C. (close to the British Museum).

**ARCHITECTURAL Institute, Society of** Architects, and Civil Service Technical Examinations. Preparation by correspondence, personally, or in residence. Seventeen first places.—MIDDLETON and CARDEN, 19, Craven-st., W.C. 1

**FOR SALE** old-established Builders' Merchant's Business, East London. Proprietor retiring. "A.E.," 91, London Wall, E.C. 1

**GENTLEMAN** holding valuable Sole Agency for Cement and Building Materials is desirous of meeting with someone in the trade to finance him. Liberal profit without risk.—Box 1063, BUILDERS' JOURNAL Office.

**MASON'S CHISEL, STEEL,**  $\frac{1}{2}$  to  $1\frac{1}{8}$  octagon, 12s. to 16s. per cwt.; Chisels, 6d. lb.; Best Cast Steel for Lettering Tools, &c., from  $\frac{1}{4}$ in., 4d. lb.—E. DEALEY, Moore-street, Sheffield. 9

## APPOINTMENTS VACANT.

The charge for Advertisements under this heading is 1s. 6d. per insertion not exceeding four lines, and 6d. per line afterwards, prepaid. Three insertions may be had for the price of two.

**WANTED,** at a small Terra-cotta Works near London, a thoroughly experienced KILN-SETTER and BURNER (to fill up time with pressing). Abstainer preferred.—Apply, stating terms, to "Kiln," Box, 1074 "BUILDERS' JOURNAL" Office.

## APPOINTMENTS WANTED.

The charge for Advertisements under this heading is 1s. 6d. per insertion not exceeding four lines, and 6d. per line afterwards, prepaid. Three insertions may be had for the price of two.

**YOUNG ARCHITECT, A.R.I.B.A.,** ASSISTS in the PREPARATION of DRAWINGS, TRACINGS, &c., at his own Office. G. SCORER, 28, Newman-street, W.

**QUANTITIES** prepared, specifications written, works measured, and variations adjusted by reliable London Surveyor. Over twenty years' experience. Special terms by arrangement.—"Surveyor," office of the BUILDERS' JOURNAL. 31

**ADVERTISER** requires EVENING WORK; drawings in pencil rapidly and neatly finished; rough sketches worked out and details prepared.—Apply "W. T.," 232, Dulwich Rise, S.E. 3

**BUILDER'S QUANTITIES** and Estimates prepared. Measurements, Variations and Extra Accounts made, or Assistance given by an experienced Surveyor on reasonable terms.—Apply, "M.," 146, Shepherd's Bush-road, W. 1

# TO MASTER BUILDERS, CONTRACTORS, AND ALL ENGAGED IN STONE-CUTTING.

**J. G. FAULDS'**

IMPROVED

## Multiplex Stone-Cutter.

*Any person manufacturing these Tools will be liable to prosecution for infringement of Patent.*

THESE IMPROVED TOOLS for stone-dressing combine lightness with great efficiency in working, with perfect freedom from the annoyance of bad sharpening, tempering, or other defects. They possess *double* the advantages of the AMERICAN TOOTHED TOOL, by having, in a handy and convenient form, double teeth, or a chisel and "tooling drove" combined, the efficiency and economy of which a PRACTICAL MAN WILL SETTLE IN A FEW MINUTES.

The outstanding merits of the MULTIPLEX STONE-CUTTER are its simplicity and economy. They are simple in construction. The Handles are made with a slot (see below) in which the Cutter is inserted, and the Tool is complete. There are no screws or joints in the Handle to give trouble in fixing or removing the Cutter. They are economical. By the use of these Tools a great saving is effected, all the loss of time, trouble, and expense incurred in getting the ordinary tools sharpened being avoided.

Owing to the handiness and durability of these Tools they are in constant use throughout the whole of the United Kingdom.

Two sample Tools, with six Cutters, sent carriage free to any address in the Kingdom on receipt of a Postal Order for 2s. to the

SOLE INVENTORS, PATENTEES, AND MANUFACTURERS—

## An Architectural Causerie.

### Architecture in the Novel: "The Girl from the Farm."

THE most sympathetic readers of Bulwer Lytton, or even of Sir Walter

Scott, fail to be altogether convinced by the descriptions of architecture that form the background of their historical romances—the glamour, sentiments, and associations, which in the lapse of time naturally attach to buildings, or groups of buildings, are strained and unreal, or the archæological knowledge is not over well woven into the thread of the stories. The reader not unnaturally comes to harbour the suspicion that the wonderful castles, churches, dwellings, and armoured knights, "sans reproche," are merely interpolated to produce a mediæval effect. Against a modern writer like Thomas Hardy no such criticism could be urged, for while his novels have many and beautiful prose pictures of old time architecture, they are never felt to be obtruded to the detriment of the general design. Without them that wonderful unity, so characteristic of his novels, would be lost, and his Wessex folk would wander through the pages like quaint and philosophic children thrust out from their inheritance. In Hardy there are set before the reader the tragedies, resulting from the clash of old and new ideas with their corresponding material expression, the new scene, at first raw and ostentatious, gradually blotting out or vulgarising the remains of an ancient world. Both Hardy and Scott press mediæval architecture into the service of their art; Hardy, as suggested, with complete success, due mainly to the relation in which his folk stand to their old time surroundings. In contrast to Hardy and Scott is the description of architecture in "The Girl from the Farm" by Gertrude Dix. In passages simple and direct, the author pictures a country scene, with bald-looking cottages, and a farmhouse in the background, such a scene as we may expect to be pretty general, as the ancient church, the vicarage, and the cottage with its thatched roof and white-washed walls, are wiped out by the "obliterator of historic records," or by the encroachment of factory upon farm lands. It is not altogether a pleasing picture, but to those interested in village life and customs, and our rural districts to-day, the picture is real enough, and is presented to the reader by an artist who reminds one at times of Flaubert, so impersonal is the description. Here are some passages from his novel: "Between eight and nine miles from Allington stood a square farmhouse, with a background of bleak hill. Around it the country was very thinly populated, dotted it wide intervals with cottages for the hinds, built of grey stone and roofed with slates, colourless where colour was most needed. The farm itself was of another style, it had originally been intended as a sort of villa residence with a pretentious stucco front, which had blistered here and there in ugly patches, emphasised rather than concealed by a thin coating of whitewash. The ugly, qualid house with its blistered walls

and sparse nettles at their base had a fascination for him. He had wanted change and beauty, and the straight, dark valley, bounded on either side by a low moist curtained wall of hills, had brought him to this. For miles round the trees were few and far between, most of them elms with bulky trunks and wild-like unluxuriant tops dotting the land on either side of the grey streak of road stretching away as far as the eye could see. The only hill for miles was the solitary mound which rose at the rear of the farm." In this quotation, which naturally suffers taken from the context, there is not only a description of rural architecture of to-day, but a certain architectural quality in the scene itself. The long valley, dotted with cottages, and bounded by the mist-curtained wall of hills, with the farmhouse at the far end, becomes very real to the reader. Mr. Lionel Johnson has almost compelled us to associate with favourite authors some symbol or image. Of Hardy he says: "My vision is a rolling

valley, much the same vision comes to her, perchance, as came to the Apostle John when sojourning on the island of Patmos, for he, too, dreamed of "a new Heaven and a new earth," he, too, saw the new Jerusalem, the city with walls "great and high," garnished with "all manner of precious stones," with shining streets entered through gates of pearl, and reached by "a golden road." G. L. L. M.

### The Study of Detail.

EACH of the great elements of architectural composition, such as mass, proportion and grouping has at one period or another received paramount attention. Mass was predominant in Thebaic Egyptian work; proportion in Grecian, and grouping in Gothic. Yet neither was sufficient, without perfection of detail, to produce a perfect architectural style. Detail in each of these three greatest of architectural periods waited upon the

ANCIENT MINT AND ALCAZAR FROM THE ERESMA, SEGOVIA.

down country crossed by a Roman road; here a gray standing stone, there a grassy barrow with its great bones, its red-brown jars, its rude gold ornament still safe in the earth; a broad sky burning with stars, and a solitary man. With the girl from the farm we learn to associate the valley bounded on either side, the lonely farmhouse, and the roads that intersect the valley, with cottages here and there. Near the end of the chapter the girl is standing in the outhouse attached to the farm with the man from Allington, her mind conjuring up beautiful visions of what life would be in the town beyond the hill. As they stand there "a ruddy shaft of sunset light pierced into the dimmest recesses of the outhouse, and both turned simultaneously to the door at the rear. The sinking sun had broken through the clouds, which flamed at their edges as though they burned with fire. A stormy crimson light suffused the open spaces of the sky, which grew rapidly wider, and were reflected in the pools, and long wet roads across the valley till they gleamed like fiery watercourses. The girl pointed to the widest and brightest of these. 'That's the way to Allington,' she cried. 'Look, it's a golden road!'" Here is the same scene, sunlit, transformed by the sun-god, and as the girl stands on the threshold of the outhouse, and looks across the

greater elements, subservient to them, embellishing without obtrusiveness, and in perfect harmony with the whole. Put differently, the architecture was commanding, over-ruling all, and the detail naturally corresponded, falling into the line. Not so has it been with revivals. With the comparatively recent Gothic revival it is well known, and almost within the memory of many of us, that an understanding of detail preceded an understanding of the full spirit of the works of the middle ages. Similarly we know that the Italian Renaissance was based on a study of Roman detail, the genius of the time developing the mass and proportion of the buildings of the time; and similarly the Roman itself was again based on the detail of the Greek, and the Ptolemaic Egyptian on that of the Thebaic work of a thousand years before. In all these instances the study of detail, first by way of copyism and then by development, has preceded the production of great architectural works. In matters of this sort, history has a great knack of repeating itself. The sequence of events in the past will probably be the sequence in the present and in the future. Of a great, elementary, original type of architecture, such as it has often been fashionable to twit the modern architect with not producing, there is at

present no indication, for there is apparently no one underlying essential motive of sufficient strength for its upspringing. On the other hand there has probably been no period of the world's history when the study of detail has been so intense and so universal as it is in England at the present time, and this study, due largely to the influence of William Morris, is carried on in no mere spirit of slavish copyism. We accept it as a matter of course that our wall papers, our table cloths, and our window curtains shall be elegantly designed, artistic as we say, in spirit; and this without thought of the significance of this introduction of beautiful detail into the commonplaces of daily life. If we are to judge by what has happened in the past, and that under much less favourable circumstances, we English of the twentieth century are bound to become, as we are indeed fast becoming, an artistic people, and the production of great architectural works is as sure to accompany universality of artistic perception now, as it did in Italy in the sixteenth century, and in England and France in the thirteenth and fourteenth. What lines these great works will follow we cannot tell, we dare not guess; but the detail is developing on well understood principles, based on the study of both the Gothic and Renaissance, and we can at least foster and assist in this development.

G. A. T. M.

### The Wayfarer in Paris.

THE Wayfarer tells me he set out for Paris with a feeling much like that which he used to have when entering a new office. Repeated experiences never seem to have brought him that serenity of mind characteristic of the wayfaring species; for whenever on some new quest he is taken short with a desire to retreat, to allow his tent, so to speak, to remain where it is. This time the symptoms were very bad, but at last, after a severe struggle, the tent pegs were lifted, materials were packed, and a sudden and erratic scuffle made for the sea-coast. After a disastrous journey, during which he lost his bag, his temper, and that modesty of demeanour of which he is so admirable an example, he arrived in Paris early in the morning. The streets of Paris, says the Wayfarer, are laid out in broad, clear and definite lines, and planned to give fine approaches to the public buildings. All the squares and gardens are similarly treated, without any miserly economy such as we find in London. In the general planning of large buildings, the laying out of streets and gardens, the Parisian is far in advance of the Londoner, and we might do worse than take a leaf out of his book and plan our municipal buildings, thoroughfares, and open spaces on more architectural lines. Not, mind you! ejaculated the Wayfarer, that I would for a moment adopt their street architecture, for that is just a trifle too monotonous and even dreary in dull weather; but we might at any rate, by the cultivation of more generous ideas as to what constitutes a public building, a street, and an open space, lose that insignificant and provincial air worn by many of the London streets. They are all too narrow, and the erection of new buildings is carried out without any regard one to the other. The first impression of a Parisian street is that they knew what they wanted to do, and straightway did it without hesitation, frequently sacrificing domestic arrangements to permit of a fine facade towards the boulevards. In justice to the Londoner it must be said that in the arrangement of flats he is ahead of the Parisian, who is either unable to grasp intricate planning, or puts a fine street before comfortable living apartments; as he lives more out of doors than the Londoner, it is perhaps wiser that it should be so. This, said the Wayfarer, hesitating a moment,

seems an inadequate explanation of the different ideas influencing French and English methods of planning and architecture. For my own part, he stuttered, there seems to be a closer sympathy between the Frenchman and the ancient Greek than with us; there is something of the studied simplicity in Parisian architecture that we find in the Parthenon. It is the same in detail. Take any single example of a street front in the Boulevard St. Germain, or the Rue de Rivoli, and examine the parts; not one, but nearly all are detailed with almost the refinement and clearness of a Greek, incarnated in the Parisian workman. Parisian streets, says the Wayfarer, summing up in a modest, but for him dogmatic way, don't appeal to me, their serenity, blitheness, and a certain air of completeness, coupled with a lack of variety are characteristic, exasperating to the Wayfarer in his contumacious moods. Row after row of windows, a seemingly never-ending parapet on either side of the principal streets, made the Wayfarer long for some change, something of the unexpected, which in Parisian street architecture never happens.

G. LL. M.

## OUR COMPETITION.

### FINAL ANNOUNCEMENT.

THOSE of our readers who intend to take part in our Competition for Designs for a Country House and have not already despatched their designs, are reminded that to-day (Wednesday, June 7th) is the

### LAST DAY

for doing so. We shall be obliged, by the conditions of the Competition, to disqualify any designs that reach us later than to-morrow.

There is every indication of a thoroughly successful competition, as no less than

### 122 COMPETITORS

have intimated their intention of submitting designs. After the adjudication has been made we shall publish a selection of the designs, which can hardly fail to prove both interesting and useful to many of our readers.

Up to mid-day on Monday designs had been received bearing the following mottoes:—

Ad Valorem, Albion, Appliqué, Bluebell, Build, Con M., Clerk of Works (two sets), Clodhopper, Comfort and Convenience, Craignez, Honte, Cypress, Dulce Domum, Endeavour, Firefly, 500 to 1 Chance, Flint, Gradatim, Hawthorn, Hospice, How, Joss, Man of Kent, Muff, XIX. Century (two sets), Ogee (two sets), Red Rose, Rustic, Sou' Wester, Tempus Fugit, 23, Unus, Yew, Young Will, Domi, Home.

Designs with the sealed envelope but without separate specifications have been received from Star and Othniel; the latter only sends two plans with the envelope. In these cases the specifications may be contained in the envelopes. We mention these details so that any competitor who has inadvertently omitted to send part of what is required by the conditions may rectify the error before it is too late.

## On Reflection.

### Birthday Honours.

THE titles and other distinctions that are awarded annually on the Queen's birthday are determined by so many other considerations than the merits of the recipients that it is with no surprise we find that the latest batch of persons selected for distinction includes very few names of real eminence. One or two there are, however, who rise prominently above the level of respectable mediocrity attained by the majority. In the knighthoods conferred upon Sir Lawrence Alma-Tadema and Sir William Henry Preece fitting honour has been paid to two men whose names will be prominently associated with the highest accomplishments of British Art and Science during the closing years of the nineteenth and—let us hope—the opening years of the twentieth century. One omission cannot fail to strike those who are concerned in the interests represented by this journal. Notwithstanding that several buildings of the first importance have been put in hand during the past few months no architect's name is included in the list. One might have hoped that at any rate the claims of the distinguished architect of the Victoria and Albert Museum would not have been passed over, especially as the Queen herself has shown so deep an interest in the new building. How long will it be before those in high places begin to recognise that the creator of noble architecture has a claim on the recognition of the State, certainly not inferior to that of the painter, the merchant, and the magistrate?

### A Needless Quarrel.

WE do not know whether either of the parties concerned in the recent dispute in the building trade considers that it has won "a famous victory." The settlement that has been arrived at seems to be a fair and reasonable one, but what must strike most observers is that the dispute might just as well have been settled without the stoppage of work for a single day. We have before expressed our opinion as to where the blame lies for this particularly needless quarrel. A group of hot-headed extremists amongst the operative plasterers, intoxicated by too much prosperity, precipitated a conflict of which many even of their fellow-workmen disapproved. But it is not always so. We do not take the view of the Liberty and Property Defence League that where friction arises between employer and employed it is always the British workman who is to blame. The unfortunate thing is that whatever the cause of the dispute, the story of its progress is nearly always practically the same: the strike or lock-out, the confident assertions of "no surrender" on both sides, the charges and recriminations, the loss of trade to the masters, the growing poverty of the men, and the sufferings of their families, and finally the coming together of the disputants in a somewhat chastened spirit, and the resumption of work on the basis of a compromise, which two or three reasonable men on each side might, at any time during the progress of the dispute have agreed upon after half-an-hour's friendly discussion. The present dispute, as it happens, has been less far-reaching than was at first expected. But at any time a similarly trumped-up dispute in another trade might involve us in a conflict between capital and labour so wide-spreading, as to be nothing short of a national calamity. It should be the object of men of good will both among employers and employed to establish in every trade some machinery, which will as far as possible ensure the blessings of industrial peace.

## VIII.—SEGOVIA.

By F. HAMILTON JACKSON, R.B.A.

(Continued from page 232, No. CCXXIV.)

PASSING the Cathedral, one proceeds by the Canongia Nueva past a plaza planted with trees, between the trunks of which one sees again the hills, blue in the distance, to the Romanesque church of San Juan, which contains the tombs of some of the Conquistadores, and also that of Colmenares, the Segovian historian, and so to the Alcazar. This was burnt down in 1862, and is now restored, and looks quite nice and new. It was once a most formidable fortress, and is picturesquely situated at the extremity of a rocky promontory, round which the Eresma flows far below. It was designed and built at the end of the eleventh century by Alfonso the Learned, who wrote here several of his works. It was repaired in 1455 by Enrique IV., who resided and kept his treasures in it. At his death the governor, Andrés de Cabrera, the husband of Beatrice de Bobadilla, who was an early friend of Isabella, held the fortress and money for her, and thereby contributed to her accession to the throne.

From this alcazar she proceeded in state in 1474, when she was proclaimed Queen of Castile. Two years later the Segovian mob rose against this Cabrera, when the Queen rode out among them, and awed the mob by her majesty and presence of mind. It was ceded to the crown in 1764 by the hereditary alcaide, the Conde de Chinchon, whose ancestor had so hospitably entertained our Charles I. in 1623 on "trouts of extraordinary greatness." It was in this alcazar that Le Sage described Gil Blas as imprisoned. The keep has a number of those angle turrets which are so common in Castilian Castles, but the roofs are of slate, and very similar to the steep French tower roofs.

A road leads round beneath a sort of inner wall to the Puerta Castellana, the guard house of which has been made into a "Refugio." In front of the doorway and along the summit of the wall are benches upon which the old men sit in the sunshine and dream over their past lives. Passing through the gate below and descending the slope beneath the walls which tower above, one reaches the Alameda—a delightful shady road planted with trees—which runs between the river and the steep rock upon which the city is built. At the bottom of the descent is a bridge, crossing which one reaches by a wind-swept yet dusty road, the town boundaries, where the octroi officers examine all packages carried by those entering the town, and where a picturesque medley of beasts of burden and strange equipages with their drivers, may be seen, backed up by the walls and tower of an old church, while away in the distance the dusty road winds up over the barren hill till it disappears in a village the roof and towers of which bristle against the sky. But a short distance along this road on the right lies the ancient church of the Knights Templars, dedicated to the true cross. It consists of a central octagonal chapel to which one ascends by steps on either side, and beneath which one may pass under a pointed vault piercing the masonry from east to west and from north to south. The vault is surrounded by a broad aisle in which are three doorways corresponding, while to the east is a small choir containing an altar, on one side of which is a chapel and on the other the sacristy. The doorways are carved in the Romanesque manner, and above the altar is a much damaged painted reredos, but the building is fast going to ruin. It is built of the same yellowish stone as the cathedral and roofed with the same sort of highly-curved purplish tiles. The

Templars erected it in 1204. Returning towards the Alameda one sees the cliff from which criminals were cast down, called "La Peña Grajera," because crows nestled there to make sure of their hideous banquet. It was from this cliff that St. Maria del Salto—of the Jump—was cast down and reached the bottom unhurt. She was a newly converted Jewess, and an image of the Virgin played a great part in her miraculous leap.

The two bridges across the Eresma, one below and one above the Casa de Moneda, or Mint, were built by the same monk who repaired the aqueduct. His convent, El Parral, is just across the second. At this mint formerly the whole of the national coinage was struck, as the river afforded cheap power and the neighbouring Alcazar a safe treasury. It is now used as a flour mill. Crossing this upper bridge and turning a short way up the stream where the washerwomen are at work is a most charming view. A stretch of greensward shaded by tall poplars with patches of snowy linen spread to dry brilliant in the sunshine, while on the other side of the stream the wooded slope rises steeply towards

bricks deep, built so as to show pyramids of colour—yellow, black, and red.

Returning to the Alameda, and re-ascending to the town, by continuing up the slope in the same direction one arrives at St. Estéban, a church of the twelfth century, with a magnificent tower and those external cloister-like porticoes which are so characteristically Segovian. The view of this part of the town from the opposite slope is picturesque, and the church makes a very striking centre of interest, while from the same place the course of the walls may be well traced. Beyond St. Estéban, low on the slope of the hill, is the late Gothic church of Santa Cruz, a building with many pinnacles marking the places of the thrusts from the vaulting, the flying buttresses being included within the aisle walls. It has a very beautiful west doorway, carved all over with a profusion of delicate, lace-like ornament, the composition including figures and armorial bearings. In any other country but Spain this would look overcharged, and even in Spain itself it is scarcely possible to go farther, and the endeavour to produce greater richness led to the failures of the seventeenth and eighteenth

FACADE OF EL PARRAL, SEGOVIA.

the houses whose roofs may be just descried above the tree tops. Looking down the stream the view is equally interesting. In the foreground is a weir, over which the river flows with a delightful sound of rushing waters, while beyond the bridge may be seen the picturesque chimneys and low pitched roofs of the ancient mint embowered in trees, and further off the towers and roofs of the Alcazar crown the rocky promontory which stands boldly out from this point of view.

The convent of "El Parral," the vineyard, was once a real paradise, as the Spanish proverb declared. It was built in 1494 by Juan Gallego and still retains some of the costly decorations of the church, though in 1848 the chapels were used as pigstyes! It is now in decay, like so many other things in Spain, and there are but nine nuns to inhabit the long ranges of cells. There are three ruined cloisters, into which we went; how many more there once were I do not know. From the ground floor of one, one passes to the upper floor of the next, so steep is the slope towards the river. Through the windows of the ruined cells charming glimpses of the Alcazar and the town may be seen. I observed a curious and effective cornice made very simply. The crowning member consisted of three rows of curved tiles, set in a great deal of mortar, and arranged diagonally. Below were two rows of bricks set anglewise, and below them was a kind of frieze about four

centuries, which are so disgusting to a pure taste. The carving here is executed with a perfect mastery over the material and the difficulties of technique, the hand of the master appearing almost to play with the chisel, and leaves, twigs, and fruit, fill the hollows with the most charming balance of light and shade, freedom and stiffness.

The Dominican convent to which the church belongs was founded by Ferdinand and Isabella. In the north transept is a niche containing the remains of a companion of the Order, which are more ancient than the church, and said to date from 1218.

A little further on is another church in a deserted plaza, used for drying and bleaching clothes apparently, which also has a fine west doorway in an earlier style, though the external cloister has been built up. We may now work round to the right till we arrive at the upper part of the hill to which the aqueduct crosses, through the arches of which may be seen on the opposite slope two or three more of the characteristic Segovian churches, with trees beyond which grow in a little valley below the town watered by a rivulet. Descending to the point by the aqueduct, which we passed before, and, turning off to the left, after crossing another brook, one soon arrives at the church of St. Millan, a fine twelfth century building with a puzzling plan. One enters close to a gallery which contains an organ, and under which is a font inclosed within a locked

grille; from this point the nave stretches away towards an altar, but what seems to be the principal altar is in a chapel towards the right. When I visited the church a funeral was in progress, and the organist was in the gallery, to all appearance directing the service. He played for a time on the organ, then sang to his own accompaniment, then coming to the front of the gallery chanted for a time unaccompanied, and then went back to the organ. Meanwhile the coffin, surrounded by tall tapers and covered with a black pall, was far away down the nave, with mourners kneeling near it as silent as its occupant. The capitals of the nave piers are well and effectively carved, and outside some may also be seen half sunk in the wall; these belonged to the arcade, which has been built up for some reason. In this part of the town are to be found some fine massive doorways, with enormously deep vousoirs, wrought-iron door knockers and projecting grilles. By a gentle ascent the Paseo del Salon is reached, a pleasant promenade planted with acacias and orange trees, where white marble seats invite repose. It lies just under the Visi-Gothic walls, the half-round towers of which, mingled with modern buildings based upon and clustered round them form a picturesque background. Below is an inoffensive iron foundry, where cast-iron of good design is still produced, and a little beyond is a little chapel embowered in trees through which a road runs crossing the brook by a picturesque bridge. From the Paseo del Salon the Plaza de la Constitucion may be regained by way of the Old Jewry, or passing farther around the outside of the walls one may re-enter the town by a fine Moorish gateway, the Puerta de Sant' Andres, and by a steep ascent behind the cathedral arrive at the same place.
